Note: You can now easily choose between DF and NDF timecode while logging without a DV deck connected.

Important: Changes made to the currently selected device control preset may not be reflected in the Log and Capture window until you close and reopen it, or switch to another preset and back to the one you modified.

Preferences

Choosing Whether the Last Previously Opened Project Opens When Final Cut Pro Launches By default, Final Cut Pro opens the last previously open project file when relaunched. You can now select whether Final Cut Pro launches with the last open project, or an empty project.

To start with a default, empty project instead of the last previously open project file: In the General tab of the User Preferences window, deselect the "Open last project on application launch" checkbox.

Interface

Command-M Keyboard Shortcut for Minimize Window Command Pressing Command-M, the default OS X keyboard shortcut, minimizes the active window in Final Cut Pro.

External Monitoring

Digital Cinema Desktop Option for Presenting Full-screen Video Monitoring on the Main Computer Display In addition to viewing Canvas or Viewer video on a second computer display connected to your computer, you can now present video on the main display.

Note: The main computer display is the display that normally shows the menu bar for applications.

This feature is particularly useful for systems with a single computer display (such as PowerBooks and high definition video editing systems with a single Cinema Display). Regardless of how many monitors you have connected, you can always choose to monitor on the main display.

Video presented on the main display is always shown in full-screen mode. In full-screen mode, the video is scaled to fit the display in at least one dimension. If the aspect ratio of the video signal and the computer display do not match, the video on the display is letterboxed (black on top and bottom) or pillarboxed (black on sides) as necessary. This is identical to full-screen mode on a second monitor. For more information about monitoring on a computer display, see New Features in Final Cut Pro HD .

To view Final Cut Pro video output on the main computer display
connected to your computer:

1. Choose Final Cut Pro > A/V Settings.
2. Click the A/V Devices tab.
3. Choose the Desktop Cinema Display - Full Screen [Main] option from the Playback Output Video pop-up menu.
4. Choose View > External > All Frames or press Command-F12.

Tip: Regular editing commands still work when full-screen video is presented on the main display. This means you can still mark In and Out points, use JKL-playback, and so on. For a list of shortcut keys, choose Tools > Keyboard Layout > Customize or see the Final Cut Pro HD Quick Reference.

Important: Command-F12 is the default shortcut key for turning external video monitoring on and off. When full-screen video is presented on the main display, the menu bar cannot be seen, so it is important to learn the shortcut key.

To turn off full-screen video presented on the main display: Press Command-F12 or press the Escape key.

External Monitoring on a Computer Display Ignores Latency Setting Directly monitoring video on a computer display does not introduce video latency. Therefore, Final Cut Pro ignores the frame delay offset setting when you monitor your video on a computer display (as opposed to an output that has inherent video latency, such as FireWire DV or a third-party video card).

For more information about latency when using an external monitor, see "External Audio and Video Monitoring" in New Features in Final Cut Pro HD

Late-Breaking Issues in Final Cut Pro HD

This document contains late-breaking information about Final Cut Pro HD. For the latest information about product updates, tips and techniques, and qualified third-party devices, visit the Final Cut Pro website (http://www.apple.com/finalcutpro/).

This article has been archived and is no longer updated by Apple.

Editing

Previous and Next Keyframe Commands Follow Auto-Selected Tracks In the Timeline, navigating to the previous or next keyframe now follows the currently auto-selected tracks.

Capture and Output

"Disk Full" Error Message Final Cut Pro preallocates disk space just prior to capturing media. Final Cut Pro HD has a higher minimum disk space threshold to prevent some cases of the "Disk Full" error message.

For best performance, use a non-boot disk for capture, render, and final output to tape.

For most situations, it's best to select journaling for your system boot disk. For your scratch disk (which is ideally a non-boot disk), you may choose to select journaling or not depending on the level of media integrity you require. Of course, all of your media is critical to your project, but some media files are easier to recapture than others. For example, media captured from tape can always be captured again (assuming proper timecode exists on the tape and in the clip).

What Is Journaling? Journaling is a technique that helps protect the integrity of the Mac OS Extended file systems on Mac OS X volumes. It both prevents a disk from getting into an inconsistent state and expedites disk repair if the server fails.

When you enable journaling on a disk, a continuous record of changes to files on the disk is maintained in the journal. If your computer stops because of a power failure or some other issue, the journal is used to restore the disk to a known-good state when the server restarts.

For more information about journaling, see the AppleCare article at http://docs.info.apple.com/article.html?artnum=107249.

Timecode

Batch Lists Always Export Clips Using Native Timecode Display Format All timecode columns in batch lists always export in their native timecode display format.

Note: This change restricts exporting batch lists with alternative time displays such as frame display mode.

EDL Timecode Support

The following sequence rates are supported for EDL export:

Timebase (frame rate)	Timecode rate
29.97, 30 fps	30
25 fps	25
24 fps	24 @ 25
23.98, 24 fps	24

Note: Final Cut Pro always uses the source timecode of the sequence.

Timecode Fields in the Time Remap Parameter in the Motion Tab in the Viewer When adjusting time remap (speed) parameters in the Motion Tab in the Viewer, the following timecode fields have the following options:

- Duration: Always shows clip time mode (as opposed to source time and View Native Speed is always deselected.
- Source Duration: Always shows clip time mode (as opposed to source time) and View Native Speed is always selected.
- Time: Shows the timecode of the current sequence.
- Source Frame: Always shows time with View Native Speed selected.

Note: To experiment with the time remap timecode fields, try using a sequence clip instead of a Browser clip.

Tutorials

Documentation for the Final Cut Pro tutorials is available on the Final Cut Pro HD installer DVD, in /Extras/Final Cut Pro Tutorial.

Compressor 1.2: Late-Breaking News

This document contains important late-breaking information about Compressor. Choose Help > New Features when using Compressor to get information on the new features added in Compressor 1.2. For the latest information about product updates, tips and techniques, and qualified third-party devices, visit the Compressor website at http://www.apple.com/finalcutpro/compressor.html.

This article has been archived and is no longer updated by Apple.

Read the following points for compatibility information about Compressor 1.2.

- Compressor 1.2 is strongly recommended for all users of any previous Compressor versions.
- Compressor 1.2 requires Mac OS X version 10.3.
- Final Cut Pro must be updated to version 4.1 for its Export Using Compressor feature to work with Compressor 1.2.
- Because Shake Qmaster and Compressor share the same Batch Monitor feature when both are installed on the same computer, you must update Shake Qmaster to version 1. 2 when you update Compressor to version 1.2. You can update Shake Qmaster using Software Update.

New Presets Included

Compressor 1.2 includes new presets designed to be used with high definition (HD) sources and with the new MPEG-1 encoder.

The new presets are automatically available in new Compressor 1.2 installations. If you are updating an earlier version of Compressor, you must remove the existing presets before Compressor will update to the new ones.

To update the presets of an earlier version of Compressor:

1. Quit Compressor.
2. Update to Compressor 1.2.
3. Locate the folder containing the current presets. It is in your home folder at /Library/Application Support/Compressor. You must remove all of the presets in this folder or Compressor will not replace them with the updated versions.
4. Copy any custom presets you want to save to a different folder or to your desktop. These include those presets you have created as well as presets included with Compressor that you have customized.
5. Delete all existing presets (all files and folders) from the /Library/Application Support/ Compressor folder.
6. Open Compressor. The new presets are added to the /Library/Application Support/Compressor folder.
7. Copy the custom presets you saved back into the /Library/Application Support/ Compressor folder.
8. To make these custom presets available to the updated version of Compressor, quit and reopen Compressor.

Incorrect Preset Names Appear for Source Media Files Dragged From the History Drawer

If you drag a submitted job from the History drawer to the Batch table for resubmission, the Preset column displays the output filename of the media file as well as the preset name. This applies to presets for all encoders, but it has no impact on the resulting output media file.

Media File Codecs May Be Unrecognized When Working With Third-Party Codecs

Compressor supports any of the QuickTime codecs. However, if you attempt to transcode a file whose codec is not installed, you may see strange drawing behavior throughout the application. Typically, parts of your monitor are drawn in black, and movies don't appear in the Preview window. Make sure you have the proper codec installed for your source media file.

To see which codec was used to create your source media file:

1. Open your source media file in QuickTime Player.
2. Choose Window > Show Movie Info.
3. Click the More Info disclosure triangle and view the Format line. The Format line displays the codec name as well as the original frame size and depth format. Once you see which codec is used by your source media file, you can check to see if Compressor will recognize it.

To see whether Compressor will recognize your source media file's codec:

1. Open Compressor.
2. Either select an existing QuickTime preset or create a QuickTime preset.
3. Click the Video Settings button in the QuickTime Encoder pane to open the Compression Settings dialog.
4. Open the Codec pop-up menu at the top of the dialog and view the codecs listed. If you don't see your source media file's codec listed, Compressor will not recognize your source media file.

Some Final Cut Pro Output Media Files Are Saved to the Root Boot Partition

If you are using Compressor to transcode a Final Cut Pro project and you choose Source as your destination, your resulting file(s) are saved to the root boot partition of your computer rather than to the source location.

Important Information Regarding MPEG-2 Files Generated by Compressor and DVD Studio Pro

Timecode
DVD Studio Pro 1.5.2 doesn't recognize imported MPEG-2 files generated from Compressor when the timecode wraps in the following way for the following broadcast formats:

- NTSC: From 23:59:59:29 to 00:00:00:00
- PAL: From 23:59:59:24 to 00:00:00:00
- 24P: From 23:59:59:23 to 00:00:00:00

If your source media file is of a duration that you know will cause a timecode wrap to 00:00:00:00 and you intend to export the MPEG-2 output media file to DVD Studio Pro 1.5.2, select the "Choose start timecode" checkbox in the MPEG-2 Encoder Video Format pane in the Presets window, and enter the timecode 00:00:00:00 in the related "Choose start timecode" field.

To view Final Cut Pro video output on the main computer display connected to your computer:

1. Choose Final Cut Pro > A/V Settings.
2. Click the A/V Devices tab.
3. Choose the Desktop Cinema Display - Full Screen [Main] option from the Playback Output Video pop-up menu.
4. Choose View > External > All Frames or press Command-F12.

Chapter Markers
Chapter markers set in Final Cut Pro and transcoded in Compressor, or set directly in Compressor, will not be present in the imported MPEG-2 data in versions earlier than DVD Studio Pro 2. However, I-frames will be set where chapter markers were named. If you are using a version earlier than DVD Studio Pro 2, you have several options.

Final Cut Pro native projects
You have the following options for Final Cut Pro native projects:

- Export QuickTime Movie: To preserve chapter markers, choose File > Export > QuickTime Export, and choose Compression Markers from the pop-up menu. You will not get the high quality and encoding options that Compressor provides, but you will keep your chapter markers.
- Export Using Compressor: If quality and encoder controls are important to your project, choose File > Export > Using Compressor to export your MPEG-2 media file. If you are using a version earlier than DVD Studio Pro 2, you can manually set the chapter markers directly in DVD Studio Pro.

Compressor native projects
You can set chapter markers using the Compressor Preview window, but they will not be preserved when exported to versions earlier than DVD Studio Pro 2. I-frames will be preserved. If you are using a version prior to DVD Studio Pro 2, you can manually set the chapter markers directly in DVD Studio Pro.

- Add DVD Studio Pro meta-data checkbox: Selecting this checkbox allows Compressor to parse specific MPEG-2 authoring information during the transcoding process to accelerate the import process into DVD Studio Pro 2. However, these MPEG-2 files will be incompatible

with DVD Studio Pro 1.5 or earlier. Leaving the checkbox unselected means the information will be parsed later in DVD Studio Pro.

Note: MPEG-2 streams with additional DVD Studio Pro meta-data are only compatible with DVD Studio Pro 2 (or later). MPEG-2 streams processed with this checkbox selected will not be compatible with versions prior to DVD Studio Pro 2.

MPEG-2 Automatic Field Dominance Ordering Inconsistent If you are using the Automatic Field Dominance setting in the MPEG-2 Video Format pane, the auto-detection mechanism sometimes picks the wrong field order (top or bottom). Auto-detection chooses the correct field order when the source media file is using the DV codec, but with many other codecs it chooses the wrong field order (all of the Compressor default MPEG-2 settings use Automatic Field Dominance).

To correct this inconsistency, create a new preset or duplicate an existing one, and set the field dominance to either "Top first" or "Bottom first" (rather than Automatic) to correspond to the field dominance of the source media file you want to transcode.

Transcoding With Compressor in Final Cut Pro When you submit a Final Cut Pro project for transcoding, Final Cut Pro begins to render and transcode frames via Compressor. You have the option to pause or cancel this process in Final Cut Pro. The recommended method for pausing a Final Cut Pro to Compressor job is to use the Stop button in the Batch Monitor toolbar. The recommended method for stopping a Final Cut Pro to Compressor job is to use the Delete button in the Batch Monitor toolbar.

Encoding video incompatibility with Power Mac G5 dual-processor

Compressor can appear to stop responding ("crash" or "hang") while encoding video on a dual-processor Power Mac G5.

This article has been archived and is no longer updated by Apple.

Symptom

- The progress indicator stops, and estimated time remaining begins to go up.
- Compressor unexpectedly quits.
- The computer stops responding ("freezes") and must be restarted.

Products affected

This only happens when using this combination of products:

- Power Mac G5 dual-processor system with Mac OS X 10.3.3 or earlier and one or more of the following:
  - Compressor 1.2
  - DVD Studio Pro 2.0.5
  - iDVD 4.0 to 4.0.1

Solution

Update to Mac OS X 10.3.4 or later.

Published Date: Oct 7, 2016

AirPort 3.4: "Error joining the selected Airport network"

Sometimes when you try to join a visible AirPort network, you may see this message:

"There was an error joining the selected AirPort network."

This message can occur due to several different scenarios. AirPort 3.4 software provides a solution for one possible cause of the issue. To **update** to AirPort 3.4 software, you must have Mac OS X 10.3.
This article has been archived and is no longer updated by Apple.
If you see the message after updating to AirPort 3.4, try these steps:

1. Dismiss the message after it appears.
2. Press and hold the Control key.
3. While holding it, reselect the network from the AirPort menu.

This causes AirPort to use an alternate connection method that may succeed. If it does not, try general **Airport troubleshooting**.

Additional information

The alternate connection method addresses a scenario in which the wireless network is not Wi-Fi compliant. The issue occurs when a Wi-Fi compliant 802.11g client tries to communicate at speeds that the non-compliant network does not support. The steps above will force the AirPort Extreme (802.11g) card to communicate in 802.11b mode, which may allow access to the non-compliant network.

When the issue occurs, the Console log may contain a message such as "WirelessJoin unexpected status: 4".

Administrators of non-compliant networks might consider updating their wireless hardware to allow better access for 802.11g clients. A firmware update often resolves the issue.

AirPort Management Utility 1.0: Noise level is not updated for some monitored clients

AirPort Management Utility lets you see the signal strength between a base station that you are monitoring and each client that is associated with it.

You may notice that the graph's measurement of noise levels remains constant for some clients. It's because some wireless clients, such as the older AirPort Card (802.11b), do not report their updated level.
This article has been archived and is no longer updated by Apple.
This document will be updated as more information becomes available.

Note: AirPort Management Utility 1.0 may be found on the software CD included with the AirPort Extreme Base Station (PoE/UL 2043).
Published Date: Oct 7, 2016

AirPort Management Utility 1.0: No graph when monitoring some 10.2 clients

AirPort Management Utility lets you see the signal strength between a base station that you are monitoring and each client that is associated with it. If you are monitoring Mac OS X 10.2 clients, graphs may not appear for some of them, though their MAC addresses may be listed.

This article has been archived and is no longer updated by Apple.
This document will be updated as more information becomes available.

Note: AirPort Management Utility 1.0 may be found on the software CD included with the AirPort Extreme Base Station (PoE/UL 2043).

You hear a pop or gap during a title or transition in iMovie

After applying a title or transition, you may sometimes hear a pop or brief period of silence between the transition and the next clip.

This article has been archived and is no longer updated by Apple.

This can happen when using iMovie versions 3, 4, and 5.

If you experience this, try extracting the audio from your video clip to a separate track before applying the title or transition. Follow these steps:

1. Select the affected clip.
2. To undo the title or transition you have added: From the **Edit** menu select **Undo**, or from the **Advanced** menu select **Restore Clip**.
3. Select the video clip in the timeline.
4. From the **Advanced** menu, select **Extract audio**. The audio for the selected clip will be moved to its own audio track in the timeline.
5. Add your transition or effect.

This document will be updated as more information becomes available.

AirPort Management Utility 1.0: What‘s the meaning of my base station status?

AirPort Management Utility (AMU) reports the status of a list of known base stations. There are three common status messages: Unknown, Normal, and Offline.

This article has been archived and is no longer updated by Apple.

Unknown

Normally, this only appears for a few seconds while the application gets the status information from the base station.

Normal

If the base station can be reached via TCP/IP, it is queried for name, contact, and description. "Normal" appears if the queried values are returned correctly.

Offline

This means the base station cannot be reached at the specified IP address.

Final Cut Pro HD: Checking saturation leads to a black screen in the Waveform Monitor

HD material isn't stored or transmitted as a composite signal, so it's not possible to view saturation data separately in the Waveform Monitor. If you select Saturation from the shortcut menu, the monitor goes black.

This article has been archived and is no longer updated by Apple.

To restore the Waveform Monitor, Control-click in the window and deselect Saturation.

AirPort Management Utility 1.0: Adjusting the SNMP scan settings

AirPort Management Utility uses SNMP to check the status of Apple base stations on the network. You can adjust the scan interval with the defaults command, which takes this form:
This article has been archived and is no longer updated by Apple.

```
defaults write com.apple.airport.managementutility
```

For example:

```
defaults write com.apple.airport.managementutility logTimeInterval 2
```

Property	Default Value	Description
logTimeInterval	1	The number of seconds to wait between retrieving saved syslog messages from a base station when the Log panel is active.
monitorTimeInterval	5	The number of seconds to wait between each SNMP query when the Monitor panel is active.
statusCheckLimit	5	The number of times to attempt to retrieve status from a base station. On a slow or busy network, this value can be increased to make the application try more often to get status from remote base stations.
statusCheckInterval	30	The number of seconds to wait between polling for base station status. The program periodically polls all the base stations it knows about in order to maintain accurate status. If you're less concerned with this and have a large number of base stations, you might want to increase this number to reduce the amount of polling.

AppleWorks unexpectedly quits if you leave the Find/Change window open

AppleWorks 6 for Mac OS X may unexpectedly quit if this sequence of events occurs:

This article has been archived and is no longer updated by Apple.

- You have multiple AppleWorks documents open (or multiple views of the same document).
- You use the Find/Change window in a document.
- You leave the Find/Change window open.
- You try to close a document.
- AppleWorks stops responding.

To avoid this issue, close the Find/Change window (shown here) before you close a document.

Playing songs encoded with the Apple Lossless Encoder on your iPod

iPod (with Dock Connector) and iPod mini can play songs encoded with the Apple Lossless encoder after you update your iPod's software to the required version.

This article has been archived and is no longer updated by Apple.

iPod model	Required software version
iPod (with Dock Connector)	2.2 or later
iPod mini	1.1 or later

Update your iPod with the iPod Updater 2004-04-28 or later before transferring Apple Lossless audio files to your iPod.

Note: Earlier iPod models that have a FireWire port and use iPod software 1.4 or earlier cannot play files that use the Apple Lossless Encoder.

Using the SnapBack arrow in iTunes

Can't find the song you're listening to? Try clicking the SnapBack arrow (in iTunes 4.5 or later). It will take you straight back to the current song.
This article has been archived and is no longer updated by Apple.

The SnapBack arrow appears only when a song is playing. It also works when you preview songs on the iTunes Store.

Published Date: Oct 8, 2016

Using Link Arrows to the iTunes Store in iTunes 4.5

In iTunes 4.5, arrows appear next to song, artist, and album names in your library and playlists.
This article has been archived and is no longer updated by Apple.

You can click these arrows to find related music on the iTunes Store.

If you'd rather browse that item in your library, there's a shortcut for that, too. For Mac users, Option-click its arrow, and for Windows users Shift-click it.
Published Date: Oct 8, 2016

Mac OS X 10.3 and later: "Jumbo" packet size is dimmed

Mac OS X can automatically configure the Ethernet port, and most users choose this option. But some networks require a custom, manual setting. When configuring manually, you may see that the Jumbo setting for Maximum Packet Size (MTU) is not available.
This article has been archived and is no longer updated by Apple.

The option is dimmed when your Ethernet device does not work with Jumbo frames. The Apple Ethernet devices that support Jumbo Frames are the Gigabit Ethernet PCI-X card and the built-in Ethernet port on the Xserve G5. The card is optional on Xserve, sold separately by the Apple Store, and may be used in the Power Mac G5. For information on third-party Ethernet devices, see the vendor's website.

Read Before You Install iPod Update 2004-04-28 (for Windows)

iPod Update 2004-04-28 supports all models of iPod and iPod mini introduced before 28 April 2004.
This article has been archived and is no longer updated by Apple.

System Requirements

- A PC with built-in FireWire or USB 2.0, or a Windows-certified FireWire or USB 2.0 card.
- Windows 2000 or Windows XP Home or Professional.

About iPod Update 2004-04-28

iPod Update 2004-04-28 supports all models of iPod and iPod mini introduced before 28 April 2004. To take advantage of new features in iTunes 4.5 and the iTunes Store, you should install the software in this updater.

Changes for iPod without a Dock connector:

- Compatibility with iTunes 4.5 and the iTunes Store.
- Improved playback performance.

Changes for iPod with a Dock connector and iPod mini:

- Compatibility with iTunes 4.5 and the iTunes Store.
- Improved playback performance.
- Support for the Apple Lossless Encoder, to enable compressed music encoding at high quality.

For more information about iPod and iPod mini, go to http://www.apple.com/support/ipod/ .

To get the latest version of iTunes, go to http://www.apple.com/itunes/download/ .

LiveType: Combined font characters render separately

LiveType may not properly handle fonts that use ligatures, or that combine glyphs together.

This article has been archived and is no longer updated by Apple.

Some fonts for languages such as Thai, Arabic, and Devanagri combine characters to make ligatures, or compound glyphs. Because LiveType handles each character as a separate glyph object, two glyphs that would normally be combined in a ligature may be rendered separately.

Fonts for Chinese, English, French, German, and Japanese should work correctly. Fonts that rely on ligatures to create "compound-glyphs" may not be handled correctly in LiveType.

This document will be updated as more information becomes available.

Making 3G export Advanced settings in QuickTime Pro

QuickTime Help contains some incorrect information about the Advanced settings for 3G export via QuickTime Pro. This document contains corrected information.

This article has been archived and is no longer updated by Apple.

If your file is in Mobile MP4 or EZmovie format, you can restrict distribution so that a file can't be sent or copied anywhere else once it is on a handset

With either of the two EZmovie formats, you can specify how many times the file can play on the handset once downloaded, or make the file expire after a certain number of days or on a certain date.

Note: The "Allow transfer" pop-up menu has only one option, "No transfer allowed."

With the 3GPP2 (EZmovie) format, the "Fragment movie" option is activated and hard-set to 15 second fragments. Fragmenting enables the file to download via HTTP in small pieces so that playback can start faster and so that larger files can be played on the handset (only the fragment, not the entire movie, must fit on the handset at one time).

Users can‘t send email within SquirrelMail

In certain circumstances, users see a browser error or the page doesn't reload when they try to send a message via SquirrelMail.

This article has been archived and is no longer updated by Apple.

Symptom

It varies by Web browser. Users may see a "browser error" or a failure to reload the page. Mozilla-based browsers indicate a failure to connect on port 80, while Safari simply does not reload the page.

Products affected

- Mac OS X Server 10.3 or later

Solution

The issue happens if the Apache environment includes definitions for SSL related settings while the server is not actually running via SSL. This can occur when the Web server is restarted via Server Admin. To resolve the issue, execute these two commands in Terminal:

```
# sudo apachectl stop

# sudo apachectl start
```

Printers connected to AirPort Extreme Base Stations have the same name

You can share a printer with computers on your network by connecting it to an AirPort Extreme Base Station's USB port. The printer will be available to computers via Bonjour (formerly "Rendezvous").

This article has been archived and is no longer updated by Apple.

If two printers with the same model name are connected to two base stations on the same subnet and you're using older AirPort firmware, you won't be able to tell which printer is which when you select one in Printer setup, nor can you rename them.

Later versions of AirPort software and Firmware resolve this issue. Use Software Update or Apple Downloads to get AirPort 4.1 or later software, which will include updated base station firmware (5.5 or later for AirPort Extreme, 6.1 or later for AirPort Express). Once AirPort 4.1 software is installed on your computer, update the firmware on the AirPort Extreme Base Station or AirPort Express.

After both software and firmware are updated, you can rename the printers in AirPort Admin Utility. Be sure that you give each printer a unique name. The new names will appear on the network, and computers will be able to distinguish between them.

Tip: On larger networks, give each printer a name that corresponds to its base station or location.

Published Date: Feb 17, 2012

AirPort Admin Utility can‘t connect when "Allow Wireless clients" is off on a WDS base station

When you are setting up a wireless distribution system (WDS) network, you may notice the "Allow wireless clients on this base station" checkbox. Remember that administrators are clients, so this setting applies to them, too.
This article has been archived and is no longer updated by Apple.
If you deselect that checkbox, you won't be allowed to connect wirelessly to the base station, even with AirPort Admin Utility. To administer the base station in this state, use one of two methods:

- Connect to the base station's LAN port with an Ethernet cable.
- Connect to a different section of the larger network -- try connecting wirelessly to a different base station and using AirPort Admin Utility via the indirect connection, for example.

Mac OS X Server 10.3: Changing the administrator password

If you log in to Workgroup Manager as the primary administrator, you can't edit your password.
This article has been archived and is no longer updated by Apple.

To change it: Log out of Workgroup Manager, then log back in as the System Administrator (root).

Tip: By default, the root user has the same password as the primary administrator account that was originally created in the Server Setup Assistant.

You should now be able to edit the primary administrator's password. After doing so, be sure to log out the root user and log back in with your regular administrator account.

Note: Be sure the search path is set to "Local", as the record for the Administrator resides in the local NetInfo database.

Mac OS X Server 10.3: Disk quota not set until the user logs in via AFP

Disk Quotas are set up in Workgroup Manager in Mac OS X Server 10.3. However, they are not enforced for an account until that user has logged in once via AFP.
This article has been archived and is no longer updated by Apple.
If the disk quotas you set up in Workgroup Manager aren't being applied to some accounts, it's probably because they connect via SMB. A user must log in at least once via AFP for the quota to apply.

To set up Disk Quotas for an account, follow these steps in Workgroup Manager:

1. Click the Sharing button in the Toolbar.
2. Click the All tab.
3. Select the volume (not share point) on which quotas are to be enforced.
4. Check "Enable disk quotas on this volume".
5. Click the Accounts button in the Toolbar.
6. Select the account to set a quota for.
7. Click the Home tab.
8. Enter an amount (in MB) in the Disk Quota field.
9. Click Save.

Then, at a client workstation:

1. Connect to the server via AFP.
2. Log in with the account you selected above.
3. Mount any shared volume (not necessarily the user's home).
4. Unmount the shared volume.

Quotas will now apply to this account whether connected via AFP or SMB.

You can view the status of an account's quota in Server Admin or by using the repquota command-line tool on the server. In Server Admin:

1. Select the name of the server (not a specific service name).
2. Click the System tab at the bottom of the window.
3. Click the Quota tab at the top of the Window.

Managed Client: Items removed in Workgroup Manager remain in a user‘s Dock

This article has been archived and is no longer updated by Apple.

If you allow users to add or remove items from the Dock, they will see the default set of Dock items, even if the items were removed via Workgroup Manager. This occurs in Mac OS X and Mac OS X Server versions 10.3 or later, because the user specific Dock preference file (.plist) settings are respected when a user is allowed to add or remove items.

A user has these items in his Dock by default:

- Safari
- Mail
- iChat
- Address Book
- iTunes
- iPhoto
- iMovie
- iCal
- QuickTime Player
- System Preferences
- Apple - Mac OS X (mail link)

Users can manually remove the unwanted items by dragging them from the Dock. An alternative is to disable the option that allows users to add and remove items (10.3 and earlier). In Mac OS X 10.4 and later, the option is "Merge with user's Dock."

Mac OS X Server: NetBoot clients cannot use the iTunes Store

The iTunes Store is not available to a NetBoot client, even though it is enabled in iTunes.

This article has been archived and is no longer updated by Apple.

NetBoot clients are not expected to work with the iTunes Store. This document will be updated as more information becomes available.

Published Date: Oct 8, 2016

Server Admin 10.3: Client computer names don‘t appear in DHCP module

In the DHCP module of Server Admin, the "computer name" fields of some Macintosh clients might be left blank.

This article has been archived and is no longer updated by Apple.

Tip: The "computer name" is set in the client's Sharing preferences.

If a client's computer name contains spaces or non-alphanumeric characters, it might not register correctly with the Mac OS X Server DHCP server. To resolve or avoid this issue, give each client a computer name that contains only alphanumeric characters, with no spaces.

Published Date: Feb 17, 2012

Mac OS X Server 10.3: /var/spool/cups/tmp folder contains thousands of files

If the Server Admin program is left connected to Mac OS X Server 10.3 to 10.3.2, the /var/spool/cups/tmp folder on the server may grow to contain a large number of files. In some circumstances it could be thousands of files that use a large amount of disk space on the startup disk.
This article has been archived and is no longer updated by Apple.
The Mac OS X Server Update 10.3.3 significantly reduces the number of files that will be written to this directory, though you may still wish to periodically clean it out. Any time you want to empty the folder, follow these steps:

1. Stop the Print Service.
2. Open Terminal (/Applications/Utilities).
3. Execute these commands:

```
$ sudo rm -r /var/spool/cups/tmp
$ sudo mkdir /var/spool/cups/tmp
$ sudo chmod 1770 /var/spool/cups/tmp
```

4. Start the Print Service.

Published Date: Oct 8, 2016

Mac OS X Server 10.2: Panther clients using Simple Finder are missing folders in the Dock

When Mac OS X 10.3 clients using Simple Finder are bound to a version 10.2 server, their Dock does not have the My Applications, Documents, or Shared folders. Mac OS X 10.2 clients see these folders as expected.
This article has been archived and is no longer updated by Apple.
Follow these steps to add the My Applications and Documents folders to the Dock. There is not a known workaround for adding the Shared folder.

1. Use a 10.3 version of Workgroup Manager to connect to your 10.2 server. If necessary, download the 10.3 Admin Tools. Use them from a Mac OS X 10.3 computer.
2. Once connected to the 10.2 server, select the affected group.
3. Select Preferences, then Dock.
4. Under the Dock Items tab, enable any of the following options, depending on what you would like to appear in the Dock:
    - My Applications
    - Documents
    - Network Home
5. Save the changes.

A user logging into the workgroup selected in step 2 above will now see the selected items in the Dock.

Note: You should only use the 10.3 version of Workgroup Manager with a 10.2 server when explicitly instructed to do so. Continue to use the 10.2 version of Workgroup Manager for all other purposes.
Published Date: Feb 17, 2012

Mac OS X Server: Giving groups different permissions on a share point

In Mac OS X Server, only a user can be the owner of a share point, not a group. This renders obsolete the method of assigning a read-write group to the Owner field and a read-only group to the Group field.
This article has been archived and is no longer updated by Apple.
You can still achieve the same permissions effect, but the setup is different. Here's an example of how you would do it:

1. Create two new groups, named "Read-Write" and "Read-Only".
2. Put all users to whom you want to give read-write access in the group Read-Write.
3. Put all members of the Read-Write group and all other users to whom you want to give read-only access in the Read-Only group.
4. Create a new share point named "Share_Point".
5. Inside Share_Point, create a folder named "Items".
6. When setting permissions for Share_Point:
    - Make an appropriate user of your choice the Owner.
    - Assign Read-Only to the Group field with read-only permissions.
    - Give Everyone no access.
7. When setting permissions for Items:
    - Make an appropriate user of your choice the Owner.
    - Assign Read-Write to the Group field with read-write permissions.
    - Give Everyone read-only access.

When a user who is not in one of these two groups connects to the server, he will not see Share_Point. Members of Read-Only and Read-Write will have the desired experience.

Mac OS X Server 10.3: "Include Mac OS X" checkbox missing from Network Image Utility

When the Network Image Utility is opened without an install CD or DVD mounted, the "Include Mac OS X" checkbox may not be visible. This feature is described on page 30 of the 10.3 Server System Image Administration Guide.
This article has been archived and is no longer updated by Apple.
Use either of these solutions:

1. Select another volume for the source, then reselect the install CD or DVD. If there are no other volumes to choose from, select the Disk Image option, then select the CD or DVD again.
2. Quit Network Image Utility, and reopen it with the install CD or DVD mounted on the Desktop.

The box will now appear.

Printing from Adobe Creative Suite (CS) Applications to Print Server

When using CS versions of Adobe Illustrator and InDesign, you might not be able to print to queues hosted on Mac OS X Server 10.3.

This article has been archived and is no longer updated by Apple.

At the client computer, the job appears briefly in the client printer window, then disappears. It doesn't print and never appears in the Queue listing of Server Admin or in the Print Service logs. However, it may appear on the server in the /var/spool/PrintService/<queue_name> directory.

To resolve the issue, update the server to 10.3.5 or later. You can get the updates here.

Published Date: Feb 17, 2012

NetInfo to LDAP migration stalls at data import

When using Server Admin to migrate from NetInfo to LDAP, the migration process may stall at the data import phase.

This article has been archived and is no longer updated by Apple.

Symptom

The progress bar in Server Admin fills about two thirds of the way, then stops. The text "Data Import" appears below the progress bar.

Products affected

- Mac OS X Server 10.3

Solution

First, execute these commands in Terminal:

```
$ sudo killall slapconfig
$ sudo killall slapadd
$ sudo slapconfig -destroyldapserver
$ sudo rm /var/db/openldap/migration/*.ldif
```

Next, follow these steps in Directory Access to go back to the original NetInfo configuration:

1. Select LDAPv3 in the Services panel.
2. Click the Configure button.
3. Show Details, if they are not already shown.
4. Delete the localhost mapping.
5. Click OK.
6. Deselect the LDAPv3 checkbox.
7. Select the NetInfo checkbox.
8. Select NetInfo.
9. Click the Configure button.
10. Configure NetInfo to bind to the IP address of the server with the tag "network".
11. Click the Authentication tab.
12. Change the pop-up menu from Custom to Automatic.
13. Click Apply.
14. Quit Directory Access.

Back in Terminal, execute this command:

```
$ nicl .. read /
```

Look at the value of the master property. It will be <host>/network. Now execute this command:

```
$ hostname
```

If the value returned from "hostname" does not match the <host> part of the master property, do this in Terminal:

```
$ sudo hostname <host>
```

This will temporarily sync the host names.

Now you should migrate again and restart the server.

Mac OS X Server 10.3: Managed clients don‘t mount SMB/CIFS volume at login

In Workgroup Manager you can set managed users to mount an SMB/CIFS volume at login. However, volumes do not mount correctly for these users unless you edit the Workgroup Manager settings.
This article has been archived and is no longer updated by Apple.
Follow these steps:

1. In the Finder on an admin workstation, choose **Connect to Server** (Command-K) from the **Go** menu.
2. Connect to the desired SMB/CIFS share (for example, "smb://server.apple.com").
3. Click the Authenticate button in the dialog.
4. Authenticate as the desired user.
5. Select a share point. It mounts in the Finder.
6. Click the Preferences icon in the Workgroup Manager window.
7. Select a user, group, or computer list.
8. Choose Login, and select "Manage these settings: Always".
9. Click the Login Items tab, and drag the SMB/CIFS share point to the list of Login Items. Note that the URL is in the format:

   ```
   cifs://user@SERVER/SHARE
   ```

10. Select the "Mount with user's name and password" option.
11. Save the changes by clicking Apply Now.
12. From the **Workgroup Manager** menu, choose **Preferences**, and be sure that "Show 'All Records' tab and inspector", is selected.
13. Click the Inspector ("bullseye") button, seen here:

14. Select the same user, group, or computer that you did in step 7.
15. Click the Accounts button.
16. Select the attribute "dsAttrTypeNative:apple-mcxsettings", and click Edit.
17. Locate the line in the format:

    ```
    <string>cifs://user@SERVER/SHARE</string>
    ```

18. Edit this line so that it has the format:

    ```
    <string>smb://SERVER/SHARE</string>
    ```

19. Click OK.
20. Click Save.

WebObjects 5.2: Upgrading the included OpenBase database

After upgrading to Mac OS X 10.3, the OpenBase database included with WebObjects 5.2 needs to be upgraded to support the new version of the operating system.
This article has been archived and is no longer updated by Apple.

Products affected

- WebObjects 5.2.2 (Developer) or later on Mac OS X 10.3

To update the database, go to the OpenBase website and download the OpenBase Personal edition and get a license (at no charge):

http://www.openbase.com/personal

Published Date: Feb 19, 2012

Mac OS X Server 10.3: Mac OS 9 clients cannot mount multiple share points

Mac OS 9 users cannot mount a second sharepoint from a Mac OS X Server 10.3 computer. A software update addresses the issue.
This article has been archived and is no longer updated by Apple.

Symptom

In Mac OS 9 you use the Chooser to connect to a Mac OS X Server 10.3 computer and mount a share point. If you subsequently use the Chooser to connect to a second share point on the same server, you expect to see a message confirming that you are already connected to the server and allowing you to choose the additional share point. Instead you see an alert that says:

"No response from the server. Please try again."

Solution

To resolve this issue, install version 3.9.4 of the AppleShare extension on the Mac OS 9 client. This version of the AppleShare extension can be found in the System Folder of a computer that has used the Classic environment in Mac OS X 10.3.

To install this extension, drag it to the System Folder of the Mac OS 9 client.

Note: This issue does no occur when connecting to a server running Mac OS X Server 10.2.8 or earlier, or when connecting to a Mac OS X computer with file sharing enabled.
Published Date: Feb 17, 2012

Mac OS X Server, Xserve: Disabling "Ignore ownership on this volume" via the command line (vsdbutil)

You can use the command line utility "vsdbutil" to disable "Ignore ownership on this volume." This technique can resolve certain permissions situations.
This article has been archived and is no longer updated by Apple.
For example: After adding a new hard drive to an Xserve, you cannot remotely change permissions to the new volume using normal means.

- Using "chown" results in no error, but the owner remains the same.
- Using "chgrp" results in no error, but the group remains "unknown."

This document describes using Mac OS X or Mac OS X Server 10.2 or later.

To resolve the issue, you can use the "vsdbutil" command-line tool to disable the "Ignore ownership on this volume" option and activate the on-disk permissions. Follow these steps:

1. Open Terminal locally (/Applications/Utilities/), or remotely connect to the server using SSH.

   Note: If you are started up from CD, you may open Terminal by choosing it from the File menu. Also note that you should not precede any commands with "sudo" if you have gone into single-user mode.

2. Execute this command to enable permissions on the volume named "NewHD":

   ```
   $ sudo vsdbutil -a /Volumes/NewHD/
   ```

   Note: "NewHD" would be your new hard drive's volume name.

3. Enter your administrator password when prompted, and press Return.
4. Execute this command to display permissions status information on the volume named "NewHD":

   ```
   $ vsdbutil -c /Volumes/NewHD/
   ```

   This should result in a line that says "Permissions on '/Volumes/NewHD/' are enabled." The following is an example of the terminal output:

   ```
   [server1:/Volumes] admin# sudo vsdbutil -a /Volumes/NewHD/
   password:
   [server1:/Volumes] admin# vsdbutil -c /Volumes/NewHD/
   Permissions on '/Volumes/NewHD/' are enabled.
   ```

Type "vsdbutil -h" for more information on this utility.

Mac OS X Server 10.3: Setting default print job status to hold

In Mac OS X Server 10.2, there is a "Hold" setting that allows the Print Server queue to hold jobs indefinitely when received by the server. When set, an administrator must explicitly allow each job to print.
This article has been archived and is no longer updated by Apple.
This setting does not appear in the graphical user interface of Mac OS X Server 10.3, but you can still make this setting at the command line. Follow these steps:

1. Be sure the Print Service is stopped.
2. Determine the ID of each print queue by executing this command in Terminal:

   ```
   $ sudo serveradmin settings print
   ```

   This will print out the Queue Data Array, including lines for each queue that look like this:

   ```
   print:queuesArray:_array_id:CE54AB2C-1401-4B3B-77E5-1AC38522FF0B:
   quotasEnforced = no
   ```

3. The long item between the colons that starts "CE54" is the array ID. You'll need to copy this ID for each queue you want to edit.
4. Then enter this command:

   ```
   $ sudo serveradmin settings
   ```

   This will give you a blank prompt.

5. Type the following command for each queue, substituting the proper array ID:

   ```
   print:queuesArray:_array_id:CE54AB2C-1401-4B3B-77E5-1AC38522FF0B:
   defaultJobState = "HOLD"
   ```

6. When you're finished, press Control-D to exit, and restart the Print Service.

Published Date: Oct 10, 2016

Mac OS X Server 10.3: Setting up Windows XP clients to print to the server queue

When you share a printer via SMB in Mac OS X Server 10.3.3, Windows XP clients say the correct driver is not installed on the server. You can ignore this message. All you need to do is select the proper preinstalled print driver, or install it if necessary.
This article has been archived and is no longer updated by Apple.
To set up a print queue for use by Windows clients, refer to the Print Services manual available at:

http://www.apple.com/server/documentation/

To set up a Windows XP client to print to the server queue, follow these steps:

1. Create a new printer.
2. Select "A network printer", and click Next.
3. Select "Connect to this printer... Name:" \\\\server\\queue_name

   Tip: Replace "server" and "queue_name" with the name of your server and queue.

4. Click Next. A dialog appears that says "You are about to connect to a printer on <server> which will automatically install a print driver on your machine... ."
5. Click Yes. A dialog appears "The server for the printer does not have the correct printer driver installed... ."
6. Click OK. A pick panel appears with a list of printer makes and models.
7. Just select the proper driver and finish setting up the printer.

   Tip: If there is more than one driver listed for your printer model, choose the one that says "PS".

Apple Remote Desktop 2.0: Additional Information for "Read Me"

Here's a list of important topics for Apple Remote Desktop 2.

- Backing up the admin database
- How to uninstall or disable Apple Remote Desktop 2
- Configuring remotely via command line (kickstart)
- Installer does not give notification of completion for RemoteDesktop.mpkg
- Admin application unexpectedly quits ("crashes") when you open it
- AirPort and modem data not collected properly in System Overview report
- Screen sharing across subnets causes black screens on clients
- Agent resets the database under certain conditions
- Stopping screen sharing for one client stops it for all clients

This article has been archived and is no longer updated by Apple.
Published Date: Feb 17, 2012

Mac OS X Server: Changes to a user record take a long time to sync

After changing a user record in Open Directory/LDAP server, the POSIX layer (lookupd) may not immediately pick up the changes.
This article has been archived and is no longer updated by Apple.

Symptom

If you use "id <user>" to find a user record, subsequently change something in the user record (such as the GID which id displays), then use "id <user>" again, the change may not be seen.

Products affected

- Mac OS X Server 10.3 or later
- Mac OS X 10.3 or later

Solution

Execute the two commands below in Terminal. This will change the time to live for the records to 300 seconds, but you are free to substitute your preferred value.

```
$ sudo nicl . create /locations/lookupd TimeToLive 300
$ sudo killall -1 lookupd
```

Published Date: Oct 10, 2016

Mac OS X Server 10.3 and Xserve: Setting up remote control for a server without a video card

Xserve G5 comes without a video card, so you may be considering remote control options. One easy way to remotely control the server is with Apple Remote Desktop administration software (sold separately).
This article has been archived and is no longer updated by Apple.
To make setup a snap, the ARD client software is preinstalled with Mac OS X Server 10.3 and later. All you need to do is remotely enable it using the command line, then start using ARD admin.

Tip: If you have any version of Mac OS X Server 10.3.3 or later, or a version of 10.3.2 that came bundled with a server, then Server Setup includes a new checkbox to enable the ARD client in the Services section, shown here:

Server Setup can be run remotely. See page 65 of the Getting Started Guide for Mac OS X Server 10.3.
Published Date: Oct 10, 2016

Macintosh Manager, Mac OS 9 Multiple Users: Login unexpectedly quits after updating Classic components

If you use Mac OS X 10.3 and either Macintosh Manager or Mac OS 9 Multiple Users on the same computer ("dual boot"), users won't be able to log in to Mac OS 9 after updating Classic components in Mac OS X 10.3. The login routine will unexpectedly quit, and the user will be returned to the Login Window.

This article has been archived and is no longer updated by Apple.

This only affects Mac OS X 10.3 to 10.3.3. Update to Mac OS X 10.3.4 or later to resolve the issue, and allow the updated system to update your Classic components again.

The specific Classic item that resolves the issue is Apple Menu Options version 1.2.1.

Apple Remote Desktop: Client moving the administrator‘s pointer

A controlled Remote Desktop client can move the administrator's pointer arrow under certain circumstances. Only mouse movements on the client are sent to the admin system, not mouse clicks.

This article has been archived and is no longer updated by Apple.

This can happen when both of these conditions are met:

- The administrator switches to another application while leaving the control window open.
- The administrator's pointer is located over the control window (even if the control window is behind another window).

Note: Even when the administrator is actively controlling the client, the client can still move the pointer.

WebObjects 5: Using the JNDI adaptor with EOModeler on Microsoft Windows

When using EOModeler to create a new model with the JNDI adaptor, you will see one of these messages:
This article has been archived and is no longer updated by Apple.

- "No reason provided"
- "Unable to load the bundle for the adaptor named JNDI..."

This happens when using WebObjects 5.1 or WebObjects 5.2 on Microsoft Windows.

When using the LDAP plug-in with its default settings, the JNDI adaptor requires that the JNDI package and LDAP Service Provider be installed on the system. Otherwise, you will be unable to create a new model with the JNDI adaptor using EOModeler.

These jar files need to be downloaded and installed:

- ldap.jar
- providerutil.jar
- jndi.jar
- ldapbp.jar

You should download them from the Sun website located at:

http://java.sun.com/products/jndi/downloads/index.html

Specifically, you would follow these steps:

1. Download the JNDI 1.1.2 packages, which consist of:
   - JNDI 1.1.2 class libraries package (jndi112.zip)
   - LDAP Service Provider package (ldap103.zip)

   Upon extraction, jndi112.zip will place the file jndi.jar in its lib folder after extraction, and ldap103.zip will place the files ldap.jar and providerutil.jar in its lib folder.
2. Download the JNDI 1.2.1 package (JNDI/LDAP booster pack 1.0 ldapbp-1_0.zip). Upon extraction, ldapbp-1_0.zip will place the file ldapbp.jar in its lib folder.

   Note: The LDAP provider supports access to LDAP directories using Secure Sockets Layer (SSL). This feature requires the "booster package", ldapbp.jar that comes with the JNDI 1.2 Standard Extension.
3. Copy the extracted jar files, as appropriate, to either:
   - `C:\\Apple\\Library\\Java`
   - `$NEXT_ROOT\\Library\\Java`
4. Modify the JavaConfig.plist file that resides under `C:\\Apple\\Library\\Java` to include this:

   ```
   $NEXT_ROOT/Library/Java/ldap.jar;$NEXT_ROOT/Library/Java/jndi.jar;$NEXT_ROOT/Library/Java/providerutil.jar;$NEXT_ROOT/Library/Java/ldapbp.jar
   ```

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information. JNDI software is licensed by Sun Microsystems, and its use is subject to their licensing terms.

Mac OS X Server 10.3.4: Server Assistant won‘t connect remotely

You may not be able to connect remotely with Server Assistant if the versions of the server's operating system and Admin Tools differ.
This article has been archived and is no longer updated by Apple.
This issue affects Mac OS X Server 10.3.4.

Be sure that you have Mac OS X Server Admin Tools 10.3.4.
Published Date: Oct 10, 2016

Mac OS X 10.3: Connecting to a server using an alias in the Dock

If you have an alias to a shared volume in your Dock, and you try using it to connect to the server, you could run into these issues:
This article has been archived and is no longer updated by Apple.

- The authentication dialog is not editable. Though your name may already appear, it's dimmed, and you can't change it.
- The authentication dialog may appear behind another window.

This affects Mac OS X 10.3 and connections that use Apple Filing Protocol (AFP), such as Personal File Sharing or Apple File Service (Mac OS X Server).

To avoid the issue, open the alias from the Finder rather than from the Dock. You could keep a copy in your Favorites folder for quick access, for example. You can use an alias in the Dock to access the shared volume after you've connected.

About the Mac OS X Server 10.3.5 Update

This software updates Mac OS X Server version 10.3.4 to version 10.3.5.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.
2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.
4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.5. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.3.5: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

The Mac OS X Server 10.3.5 Update is specifically for updating version 10.3.4. There is also a "combo" installer available, which will update any version 10.3 to 10.3.4.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements

These are some of the enhancements that are part of Mac OS X 10.3.5 Server Update:

Open Directory (Directory Services)

- Active Directory Plug-in: Addresses an issue in which some Mac OS X computers would not bind to Active Directory, affecting computers with Mac OS X 10.3.3 to 10.3.4.
- Active Directory Plug-in: Addresses an issue in which only users for the Active Directory domain to which a computer is bound can authenticate on a client computer or be located in the Workgroup Manager user list.
- Active Directory Plug-in: Addresses an issue in which the "dsconfigad" command-line tool fails to join pre-existing accounts. When attempting to bind a computer to Active Directory, the -f option for forcing a bind to an existing account results in the following message: "Error: Undefined error occurred trying to Bind this computer to Active Directory."
- Password Server: Addresses an issue in which deleted user records may still appear in Kerberos replica databases.
- LDAPv3 Plug-in: Added option to enable or disable LDAP referrals in the file /Library/Preferences/DirectoryService/DSLDAPv3PlugInConfig.plist. In some configurations, LDAP referrals can cause symptoms such as slows logins, crashes, and overall unpredictable results.

Mail Server

- Mail Server: Addresses an issue in which mail server may stop functioning, especially in an environment with high mail volume. The race condition usually occurs if the cyrus database maintenance app (ctl_cyrusdb) is cleaning up database transaction log files at the same time a POP or IMAP session is active, requiring an update to the removed log file.

File Services

- AFP: Addresses an issue in which AFP clients may drop the connection to the server when attempting multiple copy or read-write operations with one or more AFP servers. Analysis of a network trace when this issue occurs will reveal that the TCP Window size will drop to zero.
- AFP: Improved reliability and performance of AFP login to AFP server share from both Mac OS 9 and Mac OS X clients.
- NFS: Improves performance and reliability of NFS, such as better handling of lookup caching, small files, and file locking.

System Imaging (NetBoot/Network Install)

- Network Image Utility: The Network Image Utility now creates a block-copy restore image if using a volume as the source. This change improves installation performance and maintains original volume integrity.

Print Server

- Print Server: Addresses an issue in which some print jobs may not execute if the file's Postscript header is larger than 1023 bytes. This issue is more likely to affect graphic or page layout applications such as Adobe InDesign or Adobe Illustrator.

QuickTime Streaming Server

- QTSS: Provides support for streaming 3G files to Real One mobile player. This benefits users with 3G handsets and compatible service.

Directory Services

- DSAgent: Addresses the issue in which the default cache life of 12 hours for user records (such as those appearing to the POSIX layer, finger, and id) could never be overridden. Now, in most configurations, the default will fall back to five minutes and can be correctly overridden by the manually setting of the time-to-live (TTL) values, as explained in the lookupd man page.

File Systems

- NTFS: Addresses issues which may prevent copying of large files (i.e. 4GB) from an NTFS volume to another volume. Note: NTFS volumes are mounted as Read Only.

Server Admin Tools

- Server Admin CD: The CD has been updated for the Mac OS X Server 10.3.5 release, and the updated software can be downloaded here.

Mac OS X Server 10.3.5 also includes the enhancements of the Mac OS X 10.3.5 client update.

Published Date: Oct 10, 2016

About the Mac OS X Server 10.3.5 Update (Combo)

This software updates any version of Mac OS X Server 10.3 to 10.3.4 to Mac OS X Server version 10.3.5. It is a "combo" update that combines enhancements delivered with versions 10.3.1 through 10.3.5. If you already have Mac OS X Server 10.3.4, you may download a smaller update that is not a combo.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.5. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

5. If you are updating from 10.3.2 or earlier and use a MySQL database, you must back it up prior to upgrade. See the Additional Information for MySQL section, below.

6. If you are updating from 10.3.2 or earlier and have set up a loginhook, a custom serial port configuration, or have edited the "/etc/ttys" file for other reasons, you will need to back it up prior to installation of this update.This is because a 10.3.3 or later update overwrites the file with a new copy when updating from 10.3.2 or earlier. The new file will set the Xserve's serial port to communicate at 56Kbps. If your serial device cannot communicate at this speed, you must edit this file to reduce the speed.

Installation

There are two ways to update to Mac OS X Server 10.3.5: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

Mac OS X Server 10.3.5 Update (Combo) updates Mac OS X Server 10.3, 10.3.1, 10.3.2, 10.3.3, or 10.3.4 to the later version.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with earlier 10.3 updates. You can see the individual lists for 10.3.1, 10.3.2, 10.3.3, 10.3.4, and 10.3.5.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that is pre-installed Mac OS X Server 10.3.2 or earlier must be exported and re-imported in order to be compatible with version of MySQL that is pre-installed on Mac OS X Server 10.3.3 or later, in which a byte-ordering issue is fixed.

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before the upgrade, use the terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

About the Mac OS X Server 10.3.5 Admin Tools Update

Important: Read Before Installing

The Mac OS X Server Admin Tools 10.3.5 Update requires that you've previously installed Mac OS X Server Admin Tools 10.3.4 and Mac OS X Server 10.3.5 or Mac OS X 10.3.5.

Installation

There are two ways to get Mac OS X Server Admin Tools 10.3.5: Software Update and Standalone Installer.

Automatic Software Update

You may have been referred to this document by Software Update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

This standalone Installer is useful when you need to update more than one computer.

Enhancement Related to Admin Tools 10.3.5

System Imaging (NetBoot/Network Install)

- Network Image Utility: Now creates a block-copy restore image if using a volume as the source. This change improves installation performance and maintains original volume integrity.

This article has been archived and is no longer updated by Apple.

Mac OS X Server 10.3: Startup Disk 9.2.6 missing from NetBoot for Mac OS 9 disk image

Page 39 of the 10.3 Server System Image Administration Guide incorrectly states that Startup Disk 9.2.6 is available on the NetBoot for Mac OS 9 CD. Mac OS X Server 10.3 does not come with a NetBoot for Mac OS 9 CD. Instead, you can download it in the form of a disk image.
This article has been archived and is no longer updated by Apple.
To locate Startup Disk 9.2.6 on the downloaded image:

1. Double-click the downloaded NetBoot9.dmg file to open it.
2. Double-click NetBoot.pkg to begin the installation process.
3. Install the NetBoot package on your NetBoot server.
4. Once the installation is complete, open this folder:

   /Library/NetBoot/NetBootSP0/MacOS92Default.nbi/

5. Double-click the NetBoot HD.img disk image file to mount it on the desktop.
6. Open this folder:

   /Volumes/NetBoot HD/System Folder/Control Panels/

7. Copy the Startup Disk control panel from the disk image to the Control Panels folder in your local hard disk's Mac OS 9 System Folder.

Mac OS X 10.3: Modem Country Setting incorrect after using Setup Assistant

After using Setup Assistant, the Country Setting for your modem may be wrong.
This article has been archived and is no longer updated by Apple.
It may happen in this specific sequence of events:

- When offered Get Internet Ready options in Setup Assistant, you choose "I'm not ready to connect to the Internet."
- Then, for Register With Apple, you choose Register Later.

This happens when using Mac OS X 10.3 to 10.3.9 and a Macintosh with a Jump modem. You can see what kind of modem your computer has in Apple System Profiler.

To get back to the right Country Setting, follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Date & Time**.
3. Click Time Zone.
4. Change the Time Zone to one other than where you are actually located.
5. Select any city from the **Closest City** pop-up menu.
6. From the **View** menu, choose **Network**.
7. Choose **Internal Modem** from the **Show** pop-up menu.
8. Click Modem.
9. Verify the Country Setting is correct for that time zone and city you selected.
10. Repeat steps 3 through 9, but this time enter the correct time zone and city.

Apple Remote Desktop 2: Stopping screen sharing for one client stops it for all clients

If you disable screen sharing for one selected client, it is disabled for all clients in the group.

This article has been archived and is no longer updated by Apple.

This feature does not work as expected. This document will be updated as more information becomes available.

Published Date: Feb 17, 2012

Apple Remote Desktop 2: Screen sharing across subnets causes black screens on clients

Screen sharing between an Apple Remote Desktop 2 admin computer and multiple clients on a different subnet causes client displays to go black (or blank).

This article has been archived and is no longer updated by Apple.

Sharing with multiple clients across subnets does not work. Screen sharing to a single client across subnets should work.

This document will be updated as more information becomes available.

Published Date: Feb 17, 2012

Apple Remote Desktop 2: Installer does not give notification of completion for RemoteDesktop.mpkg

You can install the RemoteDesktop.mpkg on an Apple Remote Desktop 2 client, but the Installer does not provide feedback to indicate a successful installation. (Installation of this packages may be advantageous when configuring multiple administration computers or switching to another computer.)

This article has been archived and is no longer updated by Apple.

Because this particular package stops (kills) the Apple Remote Desktop 2 agent process after successful installation, the lack of notification should be considered normal behavior.

To verify successful installation of the admin application on the client, go to the client and open the application.

Apple Remote Desktop 2: AirPort and modem data not collected properly in System Overview report

Because there are differences in how Apple System Profiler collects certain data on various versions of Mac OS X, the System Overview report may not collect all client system information. Specifically, AirPort and modem data may not be collected properly.
This article has been archived and is no longer updated by Apple.
This affects Apple Remote Desktop 2 with Mac OS X 10.3 or later

This document will be updated as more information becomes available.
Published Date: Oct 10, 2016

Apple Remote Desktop (all versions): File Copy using "Specify Full Path" works for startup volume only

The Specify Full Path option used with File Copy only works for copying files to the startup volume. If you try to copy to another volume, you see this message:

This article has been archived and is no longer updated by Apple.

"Can not replace on 1 of 1 computers. Didn't copy '<filename>'. 1 of 1 items not copied."

When you want to into the path:

```
/Volumes/Non_Startup_Volume/ ...
```

Drop the "/Volumes/" and enter the path as:

```
Non_Startup_Volume/ ...
```

Apple Remote Desktop 2: Agent resets the database under certain conditions

The ARD agent process monitors the database that stores client configuration data. If the agent detects more than three attempts to start the "rmdb" process, the agent will reset the database with a default configuration.

This article has been archived and is no longer updated by Apple.

If this happens, no information about previously configured ARD clients will appear in the Remote Desktop admin application.

During normal operation, the ARD agent should not be active when the rmdb process is inactive. So this issue would primarily affect developers or administrators trying to extend their use of the RemoteManagement data, who might need to start and stop the rmdb process.

To avoid the issue, always shut down ARD in Sharing preferences before disabling the rmdb process.

It's also a good idea to back up your databases on a regular basis.

This document will be updated as more information becomes available.

AirPort Express Assistant can‘t set up a WDS when network address translation is turned off

When using AirPort Express Assistant to set up a remote station for a wireless distribution system (WDS), you may see this alert message:
This article has been archived and is no longer updated by Apple.
"The base station you selected as a WDS main base station is not distributing IP addresses. Please use AirPort Admin Utility to set up this base station to distribute IP addresses."

This happens when you've set your main station to distribute a range of user-defined IP addresses, rather than using network address translation.

As the message suggests, you can avoid this issue by simply using AirPort Admin Utility to configure for this type of network (see how here).
AirPort Express Assistant handles only the most common network configurations, while AirPort Admin Utility can be used for all available settings.

Important: After encountering this alert message, your remote station's password may be set to match that of your main base station.
Published Date: Oct 10, 2016

AirPort Express can‘t join network in client mode, flashes its status light (LED)

If you want to use your AirPort Express in client mode but unwittingly try adding it to a network that is protected with an access control list (ACL), AirPort Express will flash its status light amber once per second. This means that it wasn't able to join the network and get an IP address.
This article has been archived and is no longer updated by Apple.
The ACL is stored on the base station that is hosting the wireless network, and it contains the MAC (media access control) address of each device that is allowed to join the network. To use your AirPort Express as a wireless client, its MAC address must be added to the ACL.

AirPort Express has two MAC addresses, and both are listed on its case. The one labeled "AirPort ID" is the MAC address for its wireless interface, and the one labeled "Ethernet ID" is the one for its Ethernet port.

If you are the network administrator, you simply need to update your ACL using AirPort Admin Utility so that it includes the "AirPort ID" of the AirPort Express. If not, speak with the person who runs the network.

Apple Remote Desktop 2: Can‘t control or observe clients after update from ARD 1

If a firewall is blocking the ports that ARD 2 uses, your ARD 2 admin computer won't be able to control or observe clients after upgrading them from ARD 1 to ARD 2 (version 1.2 to 2.0, for example).

This article has been archived and is no longer updated by Apple.

If you find yourself in this situation, be sure to open the ports that Remote Desktop uses. This applies to any firewall between the administration and client systems, including NAT routers (such as an AirPort Base Station) and the Firewall feature built into Mac OS X and Mac OS X Server.

Apple Remote Desktop 2 uses some ports not used by ARD 1. You can start by opening port 5900, both TCP and UDP. For all the ports used by Apple Remote Desktop, see our complete list, which is regularly updated. For additional ARD-specific information, see Connecting through a firewall or NAT.

Published Date: Feb 17, 2012

AirPort Express Assistant changes the base station password when setting up a WDS remote

If you use AirPort Express Assistant to configure AirPort Express as a WDS remote, it will automatically change the base station password to match that of the WDS main station. This behavior protects the AirPort Express in the event that you still have the default password "public".
This article has been archived and is no longer updated by Apple.
AirPort Express Assistant does not have options for defining a separate password for the main and remote stations, but you can customize your password settings using AirPort Admin Utility.
Published Date: Oct 10, 2016

AirPort: Windows XP users must have Wireless Zero Configuration (WZC) installed to administer an AirPort base station

Wireless Zero Configuration (WZC) is a service that's part of the Windows XP operating system, but one that may not be installed by default. WZC is required before you can use your wireless network adapter to configure an AirPort Extreme or AirPort Express base station.
This article has been archived and is no longer updated by Apple.
WZC should be installed as part of XP Service Pack 2. If you haven't already done so, run the Windows Update tool in Windows XP and get Service Pack 2 or later and any other appropriate updates for your system. Microsoft has posted instructions on obtaining the latest service pack, How to obtain the latest Windows XP service pack.

If you are unable to update to Service Pack 2 for any reason, you may be able to get everything working by ensuring a compatible version of WZC is installed on an XP machine running Service Pack 1. There are a couple of ways to determine if the WZC service is installed, activated, and up to date. To see if the WZC service is installed and active:

1. From the Start menu, select Control Panels.
2. Double-click Administrative Tools (if you don't see Administrative Tools, you may need to click Performance and Maintenace to reveal them).
3. Select Services, and look for Wireless Zero Configuration.
4. Make sure that the service is started and that the startup type is set to automatic.
5. Navigate to C:\\WINDOWS\\system32\\, and locate any of these component files:
   - wzcsapi.dll
   - wzcsvc.dll
   - wzcdlg.dll
6. Right-click any of these, and choose Properties from the menu to determine the specific version. You should be using version 5.1.2600.1276 or later.

Published Date: Oct 10, 2016

AirPort Express Assistant does not work with Windows 2000

To set up AirPort Express from a Windows 2000 computer, use AirPort Admin Utility for Windows.
This article has been archived and is no longer updated by Apple.
You can administer AirPort Express from Mac OS X, Windows XP, and Windows 2000. The AirPort Express Assistant provides an easy way to set up AirPort Express, but it's specifically designed to be compatible with Mac OS X or Windows XP. To set up AirPort Express from a Windows 2000 computer, you must use AirPort Admin Utility for Windows, version 4.0 or later.

The AirPort Installer does not install AirPort Express Assistant on Windows 2000 computers, and you shouldn't copy it from a Windows XP computer.
Published Date: Oct 10, 2016

Using AirPort Express with the Phono jack on your stereo

Do your AirTunes sound funny when you connect AirPort Express to the Phono (or phonograph) input jack on your stereo? Well, it should! This is because many record turntables produce a very low signal. Consequently, most stereos are designed to boost the Phono channel.
This article has been archived and is no longer updated by Apple.
When you connect a normal line level device to a Phono jack using an analog cable, the resulting sound may be distorted, too loud, or have too much low-end boost.

To avoid this, simply connect AirPort Express to another jack such as CD, Tape 1, Tape 2, Video 2, AUX, DVD, or DAT.

Tip: This applies only when connecting AirPort Express via analog cables, not digital.
Published Date: Oct 10, 2016

Using iChat AV with a Mac OS X Server firewall

This article has been archived and is no longer updated by Apple.
You can configure Mac OS X Server as a firewall between a local network (LAN) and the Internet. Some types of iChat traffic will not pass through the Mac OS X Server firewall in its default setting. You'll need to open additional ports.

iChat uses ports 5060, 5190, 5297, 5298, 5353, 5678, and 16384 through 16403. The list of ports used by Apple products shows this in greater detail, and you can also read about an optional setup that is more complex and offers greater security.

Use Server Admin to edit the preferences for the firewall. You can find instructions for creating advanced firewall rules in the Network Services guide, starting on page 51.

Safari works briefly, then stops browsing

Does Safari surf the web for a second, then totally wipe out? Remain calm--a quick check of your hard disk name could have you back online in no time.
This article has been archived and is no longer updated by Apple.
If the name of your hard disk contains a non-ASCII character, such as a symbol, diacritical, or two-byte character, Safari may not work. If you quit and reopen it, it may work briefly again. Here's the specific symptoms you see:

- Safari quits loading websites soon after you open it, or partially displays a webpage.
- The blue progress bar stops advancing.
- The Status Bar indefinitely reads Contacting or Loading <site_name>.

Advanced Tip: The Console may say "Safari error: Conversion to encoding 'some number' failed for string 'string including offending character'."

This happens with Safari 1.2.2 in Mac OS X 10.3.4.

To avoid the issue, simply update to Mac OS X 10.3.6 or later. As a temporary solution, you can rename your hard disk.

Published Date: Oct 10, 2016

Getting a better AirTunes connection in a Microsoft Windows environment

Does your AirTunes music stream get interrupted when you use AirPort Express and iTunes with Microsoft Windows-based computers? If so, a simple adjustment to the Wireless Network Connection Properties on your Windows computers could help out.

This article has been archived and is no longer updated by Apple.

Windows scans for wireless networks every minute, sometimes causing a connection to drop, which you'd hear as skip in your music. Defining your wireless network preferences can help maintain the connection when a computer is doing another wireless activity, such as providing an AirTunes stream. Try this:

1. Go to Network Connections.
2. Right-click your Wireless Network Connection, and select Properties.
3. Select the Wireless Networks tab. In the lower section you'll find a list of your preferred wireless networks.

4. Move the network you're using for AirTunes to the top of the list.

The updated list order should improve your connection, reducing AirTunes interruptions.

Published Date: Feb 19, 2012

Configuring AirPort Express on a wired-only Ethernet network

Even though AirPort Express includes a fully-functional wireless access point, it's totally legit to use it on a wired-only network for its print server and music streaming features. When setting up for a wired-only environment, you could get a bit confused by the fact that AirPort Express Assistant refuses to hook you up. This is because AirPort Express Assistant will only connect wirelessly from a computer that has a wireless card. Don't worry -- you just need to use AirPort Admin Utility instead, as shown here.
This article has been archived and is no longer updated by Apple.
To set up your AirPort Express as a print server and AirTunes receiver on a wired network, follow these steps:

1. Connect your AirPort Express by Ethernet to your network.
2. Open the AirPort Admin Utility. On a Macintosh it's at /Applications/Utilities/. In Windows, it's at C:\\Programs\\AirPort\\Admin.
3. Select the base station from the chooser (browser) window. Click on Configure to continue.

4. Select the AirPort Tab. Next, provide a name for your base station and a name for your network. The network name is probably not as important to you, since you have a wired-only installation. However, the name you use here will become the default name for your AirTunes network.

5. If you're concerned about other unauthorized wireless clients getting on your network, you can take two additional steps. Turn the Transmitter Power down to its minimal setting (10%), and give your network a security layer.

Tip: This picture shows the Windows version, where the Transmitter Power is directly under the AirPort tab. On a Mac, you'd click the Wireless Options button to access Transmitter Power.

6. Next, set the type of security you want to use. For this implementation, it is recommended that you use WPA for home/small office (Windows) or WPA-Personal (Macintosh).

7. Now you need to turn off the router settings on your AirPort Express that provide DHCP and NAT capabilities to wireless clients. Select the Network tab. Be sure the checkbox for "Distribute IP addresses" is not checked (it is checked by default).

8. Select the Music tab, and turn on the AirTunes feature.

You will need to enter the name of the iTunes Speaker Name. On a Macintosh computer, this will take the name of the wireless network you have previously entered.
Note: Selection of the "Enable AirTunes over Ethernet" checkbox shown above has no effect after following step 7 (which is recommended for most users), but it would be required if you chose not to follow step 7 for any reason. On the Macintosh you will find this checkbox by clicking the Base Station Options under the AirPort Tab. This checkbox is not selected by default.

9. Now click Update. Your AirPort Express will now reset, and you are off an running with a streaming AirTunes network.
10. To share a printer, you need only connect it to your AirPort Express. Here's some extra information for Macintosh and Windows XP.

Published Date: Oct 10, 2016

AirTunes audio stream drops or cuts out

In certain circumstances, the AirTunes music stream you're sending to an AirPort Express may stop or cut out for periods of time.
This article has been archived and is no longer updated by Apple.
There are several things you can do to troubleshoot this.

First, if you're using a Mac, install the AirPort 4.1 or later update.

If that doesn't fix it for you, check for radio interference and physical barriers. Try setting AirPort Express to a different channel that may be less susceptible to interference, such as channel 1, 6, or 11. Then you should evaluate your site for physical barriers that can block radio transmissions. In the case of AirPort Express, stereo wiring can also be a physical barrier. Try to leave clear space between AirPort Express and your other stereo equipment.

Next, if you have any third-party access points, check the manufacturer's website to be sure their firmware is up to date.

Some people have more success with interference robustness enabled, and others with it disabled, so you might try both.

These three settings may be made using the AirPort Admin Utility (/Applications/Utilities/). Note that you'll need the version included with AirPort Express, or a later version.

1. Connect to the base station using AirPort Admin Utility.
2. Click the AirPort tab.
3. Change either the Channel, Mode, or Wireless option for testing.
4. Update the base station.
5. Repeat for each base station or each option, as applies to your situation.

For more information, see the Designing AirPort Networks manual.

Using WDS

If you use AirPort Express in a WDS environment, make sure all access points are configured to use the same channel.

If WDS is desired to allow for wired Ethernet clients at the AirPort Express, then it may help to disable the "Allow wireless clients to connect" option.

Lastly, try configuring the AirPort Express to be a client of the existing network, as opposed to a WDS node.

Using wireless security

Wireless security makes your computer work harder, so it together with an AirTunes stream might be a bit taxing for a slower system. Try using a lower grade of security or turning it off completely to see if there's improvement. If you're using WPA personal, for example, try using WEP instead. If you're using 128-bit WEP, try 40-bit WEP.

Using third-party security software

If you have installed security software that inspects outgoing network traffic on your computer, it may slow down your stream as it inspects it, causing the interruption. Try turning off any security software temporarily to isolate the issue.

This document will be updated as more information becomes available.

Changes to Summary view in AirPort Admin Utility 4.0

Looking for your printer? No problem--AirPort Admin Utility 4.0, included with AirPort Express, introduces new default view and printer features: This article has been archived and is no longer updated by Apple.

- Summary now appears as a choice in the View menu, rather than being the default view.
- A connected USB printer appears in this Summary view.

Published Date: Oct 10, 2016

AirPort Express clients can‘t see my existing Ethernet network

Are wireless computers unable to see things on the wired Ethernet network that you connected to your AirPort Express, such as printers or other computers? It's not a issue-- you just need to know when the Ethernet port on your AirPort Express acts as a LAN port or a WAN port.
This article has been archived and is no longer updated by Apple.
The detailed answer about LAN versus WAN is in the AirPort Express FAQ, but what it comes down to is this: The AirPort Express Ethernet port can either share your Internet connection (WAN) or bridge wireless clients to your existing Ethernet network (LAN), but not both at the same time.

Since AirPort Express is a fully functional wireless access point, it is set by default to share your Internet connection. Your existing Ethernet network probably already has a router sharing your Internet connection, so you simply need to follow these steps to switch AirPort Express into bridge mode:

1. Be sure AirPort Express is still connected to your Ethernet network.
2. Open the AirPort Admin Utility. On a Macintosh it's in the Utilities folder (/Applications/Utilities/). In Windows, it's saved in this path: C:\\Programs\\AirPort\\Admin.
3. Select the base station, then click Configure to continue.
   Tip: The screen shots are from Windows. On a Mac you'll see the same choices.

4. Select the Network tab.
5. Deselect the checkbox for "Distribute IP addresses".

6. Click Update.

That's it. In a minute, after the AirPort Express has time to restart, your wireless clients should be on your network.

Using AirPort Express as a client after being in WDS mode

If you transition AirPort Express to client mode after using it as a WDS station, you'll need to let the other WDS base stations know -- otherwise they might act confused.
This article has been archived and is no longer updated by Apple.
When you set up WDS, each main, remote, or relay makes a record of each of the other stations to which it has a direct, wireless connection. Changing AirPort Express from WDS to client mode does not remove the other base stations' records. They continue to regard it as a WDS station until you remove the record(s). Here are the records the stations keep:

- The main station has a record of relay and remote stations that connect directly to it. It does not have a record of any remote that connects to a relay.
- A relay station has records for both its main and any remote that connects to it.
- A remote only has one record, for the main or relay it connects to.

Suppose you had two AirPort Extreme base stations set up as a main and a relay, with your AirPort Express set up as the remote. If you took the remote out of WDS mode and put it into client mode, you would need to connect to the relay station using AirPort Admin Utility and change its setup. Here's what WDS setup looks like for a relay station:

In the picture, the AirPort Express has a network name of "Maui." So you would select Maui, then click the minus button indicated by the red arrow. Because this relay station has no remotes other than Maui, you should also change it from a relay to a remote station.

AirTunes music doesn‘t play after the computer wakes from sleep

If your AirTunes music stream isn't playing after you wake your computer from sleep, just select Computer from the pop-up list in iTunes, then select the AirPort Express again.

This article has been archived and is no longer updated by Apple.

Published Date: Feb 17, 2012

AirTunes speaker menu missing from iTunes for Windows

If your firewall is blocking the port that iTunes uses to locate AirPort Express, then guess what--you aren't going to see the speaker menu. Fixing this is as easy as opening the right port on your firewall.
This article has been archived and is no longer updated by Apple.
iTunes uses UDP port 5353 to locate AirPort Express base stations that can be destinations for your AirTunes music stream. Make sure this port is allowed through your firewall.

You can learn more about the TCP and UDP ports used by Apple products here.

The beginning of a song is clipped when streaming AirTunes to a digital receiver

Does the King advise you to "be cruel" when he's the first singer in your AirTunes lineup? Well, don't be! If you connect an AirPort Express to a stereo receiver using an optical cable, the first few seconds of your music stream might get cut off, so the song begins in the wrong place.

This article has been archived and is no longer updated by Apple.

This happens only when connecting to certain digital receivers, and it usually only happens to the first song in a stream. These digital receivers are simply synchronizing their clocks with the music stream, which may take a few seconds. This is normal when using such a receiver.

If you change the playlist or select a new track, the stream will get clipped again when the new selection starts. It will also clip if you pause and resume the same song.

Advanced tip: You could make a very short silent track that's the same length as the clipping you hear, then use it as the first track in your playlists.

In the event that you hear clipping between songs but haven't done anything to cause it, try turning on the Crossfade option. To access it: From the **iTunes** menu (Edit menu in Windows), choose **Preferences**, then click the Audio button.

The only time you should not try Crossfade is if you are listening to DTS or Dolby Digital 5.1 (AC-3).

Mac OS X can‘t connect via Comcast Internet service provider

If you have a Comcast cable modem, you might not be able to connect to the Internet. This issue may be intermittent.
This article has been archived and is no longer updated by Apple.
When this happens, the computer does not receive a DHCP lease with a valid IP address from Comcast. Instead, it uses a self-assigned 169.254.x.x address, and cannot access the Internet.

This can happen with Mac OS X 10.2 to 10.3.9 when your connection is configured via DHCP. This is not known to affect PPPoE accounts.

For Mac OS X 10.3

To resolve the issue, try updating to Mac OS X 10.3.5, which you can get here.

If the issue persists after updating, contact Comcast for further assistance. They may need to reset some equipment, specifically the cable modem termination system (CMTS).

For Mac OS X 10.2

Change your computer's configuration using these steps:

1. From the **Go** menu in the Finder, choose **Go to Folder**.
2. In the Go To Folder dialog, type this path:

   ```
   /System/Library/SystemConfiguration/IPConfiguration.bundle
   ```

3. In the resulting window, select the Resources folder.
4. From the **File** menu, choose **Get Info**.
5. Click the disclosure triangle next to Ownership & Permissions.
6. Look at the lock icon. If it's closed, click it to open it. If prompted to authenticate, enter your user password. (You must be logged in as an administrator, or "admin" user.)
7. Change the Owner from "system" to the name of the user account that you're logged in with.
8. Close the Resources Info window.
9. Open the Resources folder, and select the file named IPConfiguration.xml
10. From the **File** menu, choose **Get Info**.
11. Click the disclosure triangle next to Ownership & Permissions.
12. Change the Owner from "system" to the name of the user account that you're logged in with.
13. Close the IPConfiguration.xml Info window.
14. Be sure that IPConfiguration.xml is still selected in the Finder, then go to the **File** menu and choose **Duplicate**.
15. Rename the duplicate "IPConfiguration copy.xml" to "IPConfiguration.xml.orig".
16. Go back to "IPConfiguration.xml", and open it in TextEdit.
17. From the **Edit** menu, choose **Find**.
18. In the Find window, in the Find field, type: InitialRetryTimeSeconds
19. Click the Next button.
20. You should find a section that appears as follows:

    ```
    <key>InitialRetryTimeSeconds</key>
    <integer>1</integer>
    ```

21. Change `<integer>1</integer>` to `<integer>8</integer>`.
22. The section should now appear as follows:

    ```
    <key>InitialRetryTimeSeconds</key>
    <integer>8</integer>
    ```

23. In the Find window, in the Find field enter: MaximumRetryTimeSeconds
24. Click the Next button.
25. You should find a section that appears as follows:

    ```
    <key>MaximumRetryTimeSeconds</key>
    <integer>8</integer>
    ```

26. Change `<integer>8</integer>` to `<integer>12</integer>`.
27. The section should now appear as follows:

    ```
    <key>MaximumRetryTimeSeconds</key>
    <integer>12</integer>
    ```

28. Save the changes to the IPConfiguration.xml file, and quit TextEdit.

29. In the Finder, select IPConfiguration.xml.
30. From the **File** menu, choose **Get Info**.
31. Click the disclosure triangle next to Ownership & Permissions.
32. Change the Owner from the name of the current user to "system".
33. Close the IPConfiguration.xml Info window.
34. Close the Resources window.
35. Select the Resources folder.
36. From the **File** menu, choose **Get Info**.
37. Click the disclosure triangle next to Ownership & Permissions.
38. Change the Owner from the name of the current user to "system".
39. Close the Resources Info window.
40. Restart the computer.

If the issue persists after performing the above steps, contact Comcast for further assistance.

AirPort Express Assistant can‘t find AirPort Express when using a firewall

AirPort Express Assistant and AirPort Admin utility both use various IP ports to locate your AirPort Express. If they cant' find Airport Express, it might be because your firewall is slightly more secure than you want it to be!
This article has been archived and is no longer updated by Apple.
But before you go to check out your firewall, be sure you're using the Assistant and Admin applications included with your AirPort Express, or a later version. Earlier versions don't work with AirPort Express.

When using the built-in Mac OS X Firewall (located in Sharing preferences) or a third-party firewall, the simplest test is to temporarily turn it off and try again. If the applications can find AirPort Express with your firewall off, you simply need to turn your firewall back on, and open these ports in the firewall: 192, 5009, and 5353.

For the Mac OS X Firewall, you'd follow these steps

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View**, choose **Sharing**.
3. Click the Firewall tab.
4. Click New.
5. From the Port Name pop-up menu, choose Other.
6. In the Port Number, Range or Series field, type in:

   ```
   192, 5009, 5353
   ```

7. In the Description field type in: AirPort Admin
8. Click OK.

Published Date: Oct 10, 2016

Mac OS X: Server-based users can‘t log in, or don‘t appear in the Login Window user list

After a computer starts up or wakes from sleep, server-based accounts may not appear in the Login Window's user list, or users with these accounts may not be able to log in. However, you may notice that this issue doesn't occur if you have first logged in and out with a local user account.

This article has been archived and is no longer updated by Apple.

Tip: Remember that your preferences and the type of account determine whether a server-based account is supposed to appear in the user list. Some users type their names instead. Thus it may be normal for accounts not to appear in the user list, and you would troubleshoot those accounts based strictly on the ability to log in.

This issue occurs in Mac OS X 10.3 through 10.3.4. To resolve the issue, follow these steps:

1. Update client computers to 10.3.5 or later.
2. Avoid using DHCP Option 95 with a manual or customized Directory Access configuration. (If you do, the issue will persist.)
3. AirPort-connected computers must specify a specific network (see Note 3).

Notes:

1. After updating to 10.3.5, there will still be a 20 to 30 second delay before a network-based user can log in or until the user list starts to populate in the Login Window. That's the normal behavior for this type of configuration.

2. As an alternative to DHCP Option 95 with a manual or customized Directory Access configuration, do only one of the following:
   - If you automate Mac OS X client directory setup and specify the LDAP Directory Server via DHCP Option 95, then don't customize the Authentication Search Path (which is configured via the Search pop-menu, located by clicking the Authentication tab in Directory Access). The Authentication Path must be set to Automatic.
   - If you manually configure any aspect of Mac OS X client Directory Access configuration (this includes manually entering your LDAP Server information) and use a DHCP Server for client IP address configuration, then Option 95 must be disabled on your DHCP Server. If you can't disable Option 95, then your client computers must have manually assigned IP addresses.

3. Here's how AirPort-enabled computers specify a network:

   - From the **Apple** menu, choose **Location**, and from the submenu choose **Network Preferences**.
   - From the **Show** pop-up menu, choose **AirPort**.
   - Click the AirPort tab.
   - From the **By default, join** pop-up menu, choose **A specific network**.
   - Enter the name of the AirPort network in the Network field.
   - If the network requires a password, enter it.
   - Click the Apply Now button.

AirPort Express: "Bad param error -4" when administering from a Windows computer

If you get the message "bad param error -4" when you try to administer your AirPort Express, don't worry--the latest AirPort software update may fix that. And if it doesn't, there's an easy workaround.

This article has been archived and is no longer updated by Apple.

The issue occurs when using AirPort Admin Utility 4.0 for Windows or AirPort Express Assistant 1.0 on a computer with "Intel Centrino mobile technology" wireless capabilities. To resolve the issue:

First, download AirPort 4.1 or later. Next, try checking the Network Connection that you use to connect to the AirPort Express (usually this is your wireless connection) to ensure that it is configured via DHCP; if it is set for a static IP on a different subnet from the AirPort Express, this issue will occur.

If your issue is still unresolved, use this workaround:

1. Connect the computer to the Airport Express using an Ethernet cable.
2. Turn off wireless networking on the computer.
3. Set the computer to use the Ethernet port (restart if necessary).
4. Configure or update your AirPort Express.
5. After a successful update, switch from Ethernet back to your wireless configuration.

AppleShare IP Migration won‘t finish if you try to migrate mail to 10.3

If you're upgrading to Mac OS X Server 10.3 and select the mail database checkbox in AppleShare IP Migration, the migration won't finish. Some Apple documentation mistakenly says this feature works, but in reality it doesn't for a migration to 10.3. Here's a couple of simple workarounds:

This article has been archived and is no longer updated by Apple.

First, you could temporarily have both AppleShare IP and Mac OS X Server mail servers running, ask clients to configure both email accounts for IMAP, and then simply copy messages between the two.

Second, you could migrate the AppleShare IP mail database to Mac OS X Server 10.2.8 or earlier and then migrate the new database to Mac OS X Server 10.3.x.

AirPort Express: Using Configuration Profiles

This article has been archived and is no longer updated by Apple.

- About configuration profiles
- Creating profiles in Windows
- Creating profiles on the Macintosh
- Editing profiles
- Switching profiles
- Erasing all profiles with a factory default reset
- Determining which profile is active
- Restoring a profile after a hard reset

About configuration profiles

AirPort Express can store up to five different configurations, known as profiles. A profile contains all the settings made in AirPort Admin Utility, such as passwords, network information, and the the iTunes speaker name. The portability of AirPort Express makes this a very convenient feature, since you can save settings for the places you take it most often. Unlike old-style configuration files, profiles reside on AirPort Express itself, not on your computer.

In the Windows operating system, the Profiles pop-up menu is available at any time you are viewing a configuration, regardless of which tab you have selected.

On the Macintosh, you can click the Profiles button in the tool bar any time that you're viewing a configuration.

Note: Configuration profiles are available only on the AirPort Express base station.

Creating profiles in windows

1. Open the Profiles pop-up menu in the lower left corner of the configuration window.

2. Choose Create Profile. This opens the Create Profile window.

3. Give the profile a name. In this example the name is "Terlingua 2 Remote."

4. Click OK.
5. Now you can set options within your profile, such as network name, remote speaker name, passwords, and the Internet connection method. When you are finished setting the options, click Update. The base station will update its settings, which are stored in the Terlingua 2 Remote profile.

If you wish to add another profile, repeat the above steps using a different profile name. You can store 5 separate profiles counting the active profile.

Creating profiles on the Macintosh

To create a new configuration profile:

1. Click Profiles in the toolbar, which will open the configuration profile window.

2. Click Add to create a new profile, and give the profile a name. In this example the name is "Home Configuration."

3. Click OK.
4. Now you can set options within your profile, such as network name, remote speaker name, passwords, and the Internet connection method. When you are finished setting the options, click Update. The base station will update its settings and those are incorporated into the Home Configuration profile.

If you wish to add a second profile, repeat the above steps using a different profile name. Once you have a second profile added, you should see something like this:

Editing profiles

In Windows you can edit an existing profile by choosing Edit Profiles from the pop-up menu.

Here you can duplicate, rename, or delete and existing profile.

On the Macintosh, you simply click the Profile icon in the toolbar and then make the changes in the Profiles windows.

Switching profiles

To switch between profiles in Windows, select the one you want to use from the pop-up menu.

On the Macintosh, go to the main Profiles window and select another profile from the list.

When the base station restarts, that profile will be active.

Erasing all profiles with a factory default reset

If you want to delete all the profiles at once, use the factory default reset.

Determining which profile is active

In Windows, the active profile is the one that appears in the Profile pop-up menu when you first open the configuration, such as Factory Fresh in this image.

On the Macintosh, the active profile appears here:

This helps you keep track of which profile you are using.

Restoring a profile after a hard reset

Profiles remain in the memory of AirPort Express after a hard reset. When reconfiguring using AirPort Admin Utility 4.0 for Windows, you get options for using or replacing any profiles stored in the base station.

Option 1: The default selection reloads the previously selected profile. Pay attention to the warning that goes with this option: When you choose to use the previously selected profile, any issues that existed with the previous configuration may continue, creating the need for an all-new profile.

Option 2: The second option replaces existing profiles with a factory fresh configuration (effectively the same as a factory default reset).

Option 3: This option is best if you had issues your existing profile. Remember that you can only store five profiles in AirPort Express. If you already have five profiles, this option will be dimmed:

On the Macintosh, the process has fewer choices. You get this dialog after a hard reset:

In this example notice that your only options are to select an available profile, since there are five profiles already stored in the base station.

Tip: If you save a base station configuration, it will contain your saved profiles.

NFS volumes on third-party servers fail to mount

Connection to an NFS server may fail in certain configurations, with a server log message that looks like this one:

This article has been archived and is no longer updated by Apple.

```
Aug 4 05:44:43 leeloo kernel: nfsd: request from insecure port (11685b22:50528)!
```

This can happen with any version of Mac OS X. Here's why:

Mac OS X tries to make NFS connections from port numbers outside the traditional range expected by some NFS servers. Configuring your NFS server to accept connections on "insecure" ports above 1024 should resolve the issue. Please consult your server's documentation for configuration information.

About the Apple Remote Desktop 2.1 Update

Here are some of the enhancements included with the Apple Remote Desktop 2.1 Update.
This article has been archived and is no longer updated by Apple.

Remote Assistance

- Full screen mode: You can now control and observe remote computers in full screen mode, allowing you to view the remote screen on the entire screen of your display.
- Control and observe remote computers with multiple monitors: Administrators can now control and observe remote Mac OS X systems which have two or more displays. The displays are shown in one virtual window.
- Support for mouse scroll wheel and right-click when controlling remote computers.
- Improved control and observation of remote computers that are running applications in full screen.
- Improved opt-out for Guest Access option.
- Improved support for third party VNC Viewers and VNC Servers.
- AppleVNC Server no longer relies on presence of mDNS process.

Remote Administration

- Multi-line output for Send UNIX Command: You can now view all the results from the Send UNIX Command.
- The Install Package command now detects whether a package requires a restart and will optionally restart the client computers after the package installation has completed.
- Send UNIX Command no longer dependent on client side Observe privilege.

Asset Management

- Improved printing of hardware and software reports.
- Improved remote data collection.
- You can now drag results from reports to the Finder. The items will then be copied from the client computers to the administrator's computer.

Software Distribution

- Improved file copy for files that reside on networked home directories.

Other enhancements

- Client authentication using Active Directory: Clients can now be authenticated against directory services groups in Active Directory.
- Improved client authentication using two additional directory services groups, ard_manage and ard_interact. Members of the ard_manage group will be able to perform all commands except for Control and Observe. Members of the ard_interact group will be able to perform all commands under the Interact menu.
- Enhanced column sorting in the Administration application.
- Improved support for managing computers that have Dynamic DNS enabled.
- Administration application now correctly remembers it's settings if it unexpectedly quits.
- The ordering of network scanners is now remembered.
- Includes security fix present in Security update 2004-10-27 (details).

AirPort Express feels warm to the touch

After an extended period of use, or if you surround it with a bunch of insulating material, AirPort Express might feel a bit hot to you. As with all our products, Apple designed AirPort Express to comply with safety agency specifications. With proper usage, the surface temperature of the AirPort Express should not present a safety issue.
This article has been archived and is no longer updated by Apple.
When using your AirPort Express, it's normal for its case to get warm. The case works as a cooling surface, transferring heat inside the unit to the cooler air outside.

Follow these suggestions to reduce the AirPort Express operating temperature.

Orientation

If you plug your AirPort Express directly into the wall, orient the base station in the proper direction. The cables are designed to protrude from the bottom of the AirPort Express.

Note: You should connect all cables to the AirPort Express prior to plugging it into the wall, except when following the printer troubleshooting technique documented here.

Avoid insulating material

Do not place your AirPort Express on a pillow or other soft material (carpets, bedding, etc) when it is on, as the material may restrict the flow of air around the base station and cause it to overheat.

General Placement for use with AirTunes

Place your AirPort Express in an open area where there are few obstructions, such as large pieces of furniture. Try to place the base station away from metallic surfaces.

If you place your AirPort Express behind furniture, keep at least an inch of space between your base station and the edge of the furniture.

If you place your AirPort Express in an entertainment center with your stereo equipment, be sure not to completely surround the base station with audio, video, or power cables. Place the base station so the cables are to one side. Maintain as much space as possible between the base station and the cables.

If you place your AirPort Express behind your stereo equipment, place it on one side or the other. Avoid centering it behind your stereo.

AirPort Express complies with the safety standard for Safety of Information Technology Equipment, IEC 60950. This safety standard has been adopted by many countries and is referred to as UL 60950 in the United States, CSA 60950-00 in Canada, EN60950 in Europe, and ASNZ3260 in Australia and New Zealand.

Apple Remote Desktop 2: Automatic client upgrade does not appear to be complete

If you use the Upgrade Client Software feature to get a client from ARD 1 to ARD 2, the progress window may not correctly report to you when the upgrade is actually finished.

This article has been archived and is no longer updated by Apple.

This issue affects Remote Desktop 2.0. To resolve the issue, update the admin computer to Remote Desktop 2.1 or later.

Published Date: Feb 17, 2012

Network Utility reports IP addresses for inactive Ethernet interfaces

If you use Network Utility to check Info on an inactive Ethernet port, you'll see it has an IP address of 144.3.8.0 or 6.3.6.0.

This article has been archived and is no longer updated by Apple.

This eccentricity of Network Utility does not mean the interface is really active. If you want to avoid this confusion, review the IP addresses of active interfaces in Apple System Profiler, System Preferences, or Terminal (using the ifconfig command).

MiniDock	512K	256 G	256 C	256 C	256 C

G = Number of Grays
C = Number of Colors

3400 Notes:
1) The computer does not provide a display with 2 bits per pixel.

2) An SVGA monitor's display resolution will be 640 by 480 pixels. The user can switch to a higher resolution by using the Monitors control panel or the control strip. The resolution set by the user will be used the next time the computer is started up.

3) If the external monitor can display 800 by 600 pixels at 60 Hz, the PowerBook 3400 computer can display simultaneously on both the external monitor and the flat panel display. This mode of display, called Simulscan, provides the same information on both displays.

Mac OS: Minimum and Maximum RAM Disk Size

This article lists the minimum and maximum RAM Disk sizes for various versions of Mac OS.

This article has been archived and is no longer updated by Apple.

Mac OS Version	Minimum RAM Disk Size	Maximum RAM Disk Size	Notes
System 6 and earlier	192 K	256 MB	--
System 7.5.2, 7.6.x	416 K	256 MB	Maximum RAM Disk size is based on the amount of installed RAM minus the RAM required to run the system software.
Mac OS 8 and 9	512 K	256 MB	Minimum RAM Disk size is determined by amount of RAM in computer; 512 K for every 128 MB of RAM. Maximum RAM Disk size varies by available RAM, but never exceeds 256 MB.

For additional RAM Disk information, see the following articles:

Article 16809: "**RAM Disk: Description, Setup, and Use**"

Article 16810: "**RAM Disk: Resizing or Deleting**"

Mac OS: Rescued Items Folder Appears in the Trash

This article describes the Rescued Items Folder that appears in the Trash Can.
This article has been archived and is no longer updated by Apple.
The Rescued Items Folder is created any time a Mac OS computer starts up with items in the Temporary Folder. These items are then moved from the Temporary Folder to the Rescued Items Folder in the Trash so the user can inspect them.

The Temporary Folder sits at the root level of a drive, is invisible to the user and applications can use it for any purpose. Typically, this includes scratch files or temporary data files.

Apple‘s Printer Description Files: Where to Get Them

How does one obtain Apple's PostScript LaserWriter Printer Description Files (PPD's) for use on a Macintosh?
This article has been archived and is no longer updated by Apple.
Apple's PPD's are installed by the Mac OS Install program and are stored in the Printer Description Folder (located in the Extensions folder in the System Folder). Older LaserWriter Software installers too install the PPD's; however, the most recent printer software is only available on the current Mac OS Install CD.

Adobe has Apple PPD's posted on their website at: **http://www.adobe.com/**

Adobe has also posted many third party PPD files.

Note: Beginning with Mac OS 9, the LaserWriter and LaserWriter Plus PPD's are no longer installed by this Mac OS as no testing was performed with these PPDs and printer.

Personal Sharing: File Sharing Can‘t Be Enabled Message

I get the message, "File sharing cannot be enabled", even though I have file sharing turned on. What do I have to do to enable personal file sharing?

This article has been archived and is no longer updated by Apple.
Personal File Sharing was first introduced in System 7, and has been a part of all subsequent releases of Apple system software (Mac OS 7.6, Mac OS 8.0, Mac OS 8.5 and so forth).

Try these steps in the order presented. If a step fails to restart file sharing, proceed to the next one.

Two Volumes With The Same Name

You may receive the "File sharing cannot be enabled" error message if two volumes of the same name are present on the desktop at the same time. For example, if an image was made of a mounted CD and then the image was opened, the error message would appear (if filesharing is enabled). This behavior is normal since the newly mounted image has the same name as the already mounted image.

Third-Party File Sharing Software

Find out if TOPS (a third party filesharing application) or other file sharing software was previously run on your system. Third-party filesharing software that performs this function can modify the System file, disabling Personal File Sharing. If so, do a clean installation of system software.

Adequate Volume Space

Look for adequate space on the volumes being shared on your computer. Mac OS creates an AppleShare PDS file which maintains information about what folders and disks are shared, and with whom. If there is insufficient space on **any** attached disk or partition, file sharing is not enabled. File sharing requires at least 360K of disk space available on each connected disk or partition. More space may be required when there are a large number of folders. If **any** volume (not just the startup volume) has less than 360K available, File Sharing reports "File Sharing Cannot Be Enabled."

The only exception to this requirement concerns locked volumes, such as CD-ROMs. The information required for sharing a locked volume is stored in the Preferences folder on the startup disk instead.

Adequate RAM

File sharing requires about 268K of RAM (Random Access Memory) to operate. Insufficient RAM may prevent Personal File Sharing from starting up. Either disable unnecessary extensions or acquire additional RAM for your computer.

Unmount PC or DOS Volumes

Make sure there are no DOS volumes mounted. If there are, eject the volume and try again.

Reset Parameter RAM

Reset the Parameter RAM (PRAM) by pressing the key sequence Command-Option-P-R while starting your computer. **Note:** This also resets the serial ports, so you may need to reactivate AppleTalk and reconfigure the Ethernet connections on some Macintosh computers.

Conflicting Extensions

Conflicting extensions may prevent Personal File Sharing from starting up. To test for this condition, use the Extensions Manager (if using System 7.5 or newer) to enable only Apple Mac OS extensions and then restart the computer. If Personal File Sharing now works, find the conflicting extension by turning on the extensions one at a time.

Delete the File Sharing Folder

1. Delete the File Sharing folder from the Preferences folder within the System Folder.
2. Restart the computer.
3. Turn File Sharing on.

Third-Party Formatting Software

If you format any media with a third-party utility, check with the vendor for compatibility with Personal File Sharing and replace the driver if necessary.

Recreate the AppleShare PDS File

You can delete an invisible file called AppleShare PDS on the top level of all connected volumes when sharing. The AppleShare PDS file may need to be deleted on each volume on multiple drive systems, or drives with multiple partitions.

To help troubleshoot in multiple drive situations, start the computer with just the startup volume on. If file sharing works in this configuration, add another drive to the chain and test file sharing each time until you find the drive that prevents file sharing from starting. You can then concentrate on the drive that fails and remove its PDS file.

Important: Deleting the PDS file removes all access privileges assigned to folders. You need to reassign access privileges to the folders.

1. Open Stickies from the Apple Menu, open a new note (any note).
2. Type anything (as long as characters are there).
3. Select Export Text from the File Menu.
4. Name the file "AppleShare PDS" (capitalization not necessary, but the spelling and the space is important).
5. Save the file on the first (root) level of the Startup Drive.
6. A dialog box will come up asking if you want to replace the file? Yes, you want to replace it.

Note: If it does not prompt you to replace the file (step 6 above), then it didn't work. Check the file name and saving destination.

If this is an AppleShare IP Server, another option is to use AppleShare IP First Aid (excerpt taken from article number 60021).

The ASIP First Aid utility also allows you to make PDS visible or invisible. Select the option you want from the Utilities menu, then select the appropriate volume. (The AppleShare PDS file, normally invisible, is located at the root level of each local read/write volume on the server's desktop.) By making it visible, you can manually back up the file to a floppy or some other volume. It is not essential that the file be made invisible again, but by doing so, you prevent the file from being inadvertently renamed or moved, which would cause a loss of privileges on the server.

An unsupported alternative is using ResEdit:

1. Use ResEdit or some other disk utility to make the AppleShare PDS file visible so you can drag it to the Trash. If you do not have such a utility, try to replace the Owner Name and Macintosh Name in the File Sharing control panel with different text. You can change them back to their original values later. When you start File Sharing, the system creates a new AppleShare PDS file on the startup volume.
2. Restart the computer.
3. Turn File Sharing on. New AppleShare PDS files are created.

Delete Users & Groups Data File

1. Turn file sharing off using the File Sharing control panel.
2. Move (do not delete) the Users & Groups data file, in the Preferences folder, to another folder outside the System folder.
3. Restart the computer.
4. Open the File Sharing control panel, and enter a new Owner Name, Owner Password, and Macintosh Name, replacing any previous data. Be sure to use new or different names.
5. Turn File Sharing on.

Note: You must reset all access privileges after completing these steps.

If this does not resolve the problem, move the Users & Groups data file back into the Preferences folder.

Reinstall Software

Before reformatting the hard disk, try reinstalling the system software or File-Sharing software and restart the computer.

Reformat

Back up the data and reformat the media. A bad block may be causing the problem.

Important: Be sure to back up your data before reformatting. The formatting process erases all data from the volume.

Apple Color Monitors: Cause of Thin Horizontal Line(s)

Why do some Apple color monitors have a thin line or lines across the screen?
This article has been archived and is no longer updated by Apple.
The CRT has a specially constructed aperture grill that improves its convergence and produces a sharp and clear image. The aperture grill is a grid of vertical wires located just behind the CRT screen. These CRTs require a horizontal stabilizing wire or wires to help support the aperture grill. The stabilizing wires, which are thinner than a human hair, dampen the vibration of the aperture grill wires. If the aperture grill wires were allowed to vibrate then the display quality would suffer, each time somebody tapped the display or bumped the table where the display is located.

Typically, displays with a viewing area of 15 inches or less have a single horizontal grid wire approximately one third from the bottom of the display image. Displays larger than 15 inches typically have two wires, each about one-quarter to one-third of the way from the top and bottom of the display image. Televisions may have up to three stabilizing wires, but because of the constantly changing images are rarely noticed.

These Apple products include a tron-style CRT:

- 13-inch High Resolution RGB Monitor
- 14-inch Macintosh Color Display
- Multiple Scan 17 and 20 Displays
- AppleVision 1710 and AppleVision 1710AV Displays
- Macintosh 16-inch Color Display
- Macintosh Color Classic
- AudioVision 14 Display
- Macintosh TV
- Macintosh LC 520, 550, 575
- Performa 550, 560, 575, 577, 578
- ColorSync 17-inch Display
- ColorSync 20-inch Display
- AppleVision 750 Display
- AppleVision 750 AV Display
- AppleVision 850 Display
- AppleVision 850 AV Display
- Apple Studio Display 17 (16 inch viewable image size)
- Apple Studio Display 17 (ADC) (16 inch viewable image size)
- Apple Studio Display 21-inch (19.8-inch viewable image size)

Macintosh Family: Batteries and Part Numbers

This document provides information and part numbers for backup and system batteries used in portable and desktop Macintosh computers released prior to 1997-11. For Macintosh computers introduced after 1997-11, see technical document 86181, "**Macintosh Family: Batteries and Part Numbers, Part 2**".
This article has been archived and is no longer updated by Apple.
Some Macintosh computers have a backup battery to maintain system settings, such as the date and time, when the computer is turned off . The battery may last up to five years. However, this varies due to the battery's shelf life, and usage patterns of the computer. The batteries used in Macintosh computers are lithium or alkaline, and are commonly 3.6 V to 4.5 V.

If your computer does not retain parameter RAM (PRAM) settings when it is turned off, this generally indicates that the battery needs to be changed. Some Macintosh models may display a black screen when you turn them on if the battery needs to be changed.

If you are uncomfortable changing the battery, an Apple Authorized Service Provider can install one for you.

Desktop Macintosh Computers

Macintosh Model	Battery part no.
Macintosh 128, 512K, 512Ke Macintosh Plus (battery equivalents: Eveready 523-BP, Ray-O-Vac RPX-21, Duracell PX-21, Panasonic PX-21)	742-0003

Macintosh: Glossary of Terms

This article defines some of the common terms used when discussing Macintosh computers.
This article has been archived and is no longer updated by Apple.

Alias
A file that stands for and points to a file, application, folder, or disk that you use as if it were the original. When you open an alias it opens the original file, application, folder or disk that it points to.

Apple Backup
An application for the Macintosh Performa computers that lets you copy files on your hard disk onto a series of high-density floppy disks. If the original files on your hard disk are lost or damaged, you can use these backup disks to restore your files.

Apple Desktop Bus (ADB)
Input circuitry built into many Apple computers. You use the ADB port to attach the keyboard, the mouse, and other input devices, such as graphics tablets and bar code readers. Universal Serial Bus (USB) has replaced ADB.

Accelerated Graphics Port (AGP)
An interface specification that enables 3-D graphics to display quickly on ordinary personal computers.

Apple Menu
The menu at the left end of the menu bar, indicated by the Apple logo. You choose items from this menu to open items that you have placed in the Apple Menu Items folder, and to get information about programs that are currently running ("About ╔").

Apple Restore
An application program that lets you restore information on your hard disk from a backup disks made with Apple Backup.

AppleTalk Network
A comprehensive network system that runs on a variety of cable systems and protocols. It facilitates communication between network devices, such as your computers, file servers, and printers, which may be a mixture of Apple and non-Apple products. Several elements make up an AppleTalk network system: AppleTalk software and AppleTalk hardware; the latter includes computing components and connectivity components.

AppleTalk Connectivity
AppleTalk's design lets you include a variety of data-link and cabling methods in a network system. Data-link and cabling methods widely used include LocalTalk; EtherTalk, using standard Ethernet media; and TokenTalk, using token ring media.

At Ease
Software that lets you use a Macintosh without using the Finder interface. At Ease provides easy ways to open files and prevents you from deleting files or changing system software. It is particularly suited to homes and classrooms.

Chooser
A program that lets you designate devices such as printers and shared disks on a network for your Macintosh to use.

Clipboard
An area in the computer's memory that functions as a holding place for what you last cut or copied. Information on the clipboard can be pasted into documents.

Control Panels
Programs that let you change various Macintosh features, such as sound, mouse movement, and keyboard options. Control panels are located inside the System folder.

Desk Accessories
Small application programs that you can add to your system. Desk accessories are installed in the Apple menu. Some of those provided with the Macintosh include the Calculator, the Chooser, Control Panels, Key Caps, and the Scrapbook.

Desktop
Your working environment when you are using the Finder interface on the computer (the menu bar and the background area on the screen), on which you work with icons and windows.

Documents Folder
A folder on the desktop that can be set up as the default folder when you save a document.

Finder
The application program that maintains the Macintosh desktop and starts up other programs at your request. You use it to manage documents and

programs, and to get information to and from disks. The Finder is what you see when you start up your computer.

Folder
A container for documents, programs, as well as other folders on the desktop or in directory windows.

Icon
A small pictorial representation of a file, disk, menu, option, or other object or feature.

Launcher
A system extension containing aliases of programs and other items. The Launcher window can be set up to open automatically when you start your computer. You can add to or change the contents of the Launcher to suit your own needs.

NuBus
A bus architecture that lets you add a variety of components to your Macintosh by installing cards into expansion slots (such as video capture cards and networking).

Operating System
Software that coordinates the internal activities of the computer and its peripheral devices. An operating system performs basic tasks such as moving data to and from devices and managing information in memory.

Peripheral Component Interconnect (PCI)
An interconnection system between a microprocessor and attached devices in which expansion slots are spaced closely for high speed operation.

ProDOS
The operating system for Apple II computers.

QuickTime
A system software extension that lets you play synchronized video and sound clips on your Macintosh.

Scrapbook
A desk accessory in which you can save frequently-used graphics, text, and sounds. The scrapbook can store multiple images. You can cut or copy images from the Scrapbook and paste them into documents.

SCSI (Small Computer Systems Interface)
A specification of mechanical and electrical standards for connecting certain peripheral devices (such as CD-ROM drives, external storage drives, and scanners) to a computer.

System File
A software file required for starting up the computer. You can customize it with fonts and desk accessories.

Universal Serial Bus (USB)
A plug and play interface between a computer and add-on devices (such as printers, scanners, digital cameras, keyboards, mice, etc.)

Macintosh: Lists of viruses

This article has been archived and is no longer updated by Apple.

Where can I find a list of "Macintosh viruses"?

You can check the Internet for information about the kinds of viruses that could potentially affect Macintosh computers. Here are a few examples:

"Macintosh Viruses"

(http://www.faqs.org/faqs/computer-virus/macintosh-faq/)

Fonts: Bitmap, PostScript, and TrueType Compared

This article compares bitmap, PostScript, and TrueType fonts. This article also explains the basics of font terminology and mechanics and answers some of the most frequently asked font questions.

Note: This document covers fonts in Mac OS 7 through Mac OS 9.2.2. It does not pertain to any Mac OS X fonts, but does apply to Mac OS 9 fonts used in the Mac OS X Classic environment.
This article has been archived and is no longer updated by Apple.

Bitmap, TrueType, and PostScript Fonts

Suitcases can contain only bitmap and TrueType fonts; PostScript printer fonts are separate files. A suitcase could contain just bitmap fonts, bitmap fonts and a corresponding TrueType font, or bitmap fonts that correspond to a separate PostScript printer font.

You can mix all three types of fonts in the same document.

Bitmap Font

A bitmap font (also called fixed-size) is a representation of a certain font in an exact size. Bitmap fonts have the single letter "A" shown on their icons. You need a separate font for each size of character you want to use. Fonts are contained in font suitcases in System 7.1 and later, or in the System suitcase in System 7.0 and 7.0.1. Open the suitcase to see which fonts are installed.

Bitmap fonts consist of "pictures" of a typeface at specific sizes. For example, you might have bitmap fonts at 10, 12, and 18 point sizes installed in your Macintosh computer. Times 12 contains each character of the Times font at exactly 12 point.

If you try to use sizes that aren't installed, the Macintosh scales one of the other fonts. First it checks for one half the size of the requested size, then it looks for one twice the size, and finally it uses the largest size. This often results in type that is blocky and less legible. Specifically installed bitmap font sizes look smooth on any screen and print smoothly on PostScript printers.

PostScript Font

PostScript is an industry-standard page description language used for describing text, graphics, and digitized images for printed pages. A PostScript font has two parts to it; a bitmap font that the Macintosh uses like any other bitmap font, and a printer font used only by PostScript printers and Adobe Type manager software. All PostScript printer fonts have corresponding bitmaps; without them, your font does not appear in the Font menu of your applications. Like TrueType, PostScript printer fonts are a scalable outline. However, they require Adobe Type Manager (ATM) software to display without jaggies or print smoothly on a non-PostScript printer. The LaserWriter driver converts fonts to mathematical formulas instead of bitmapped images.

PostScript uses outline font technology to describe characters as a number of PostScript or B-spline curves. These curves are stored as mathematical constructs that form the outline of a character. The print controller processes the constructs to arrive at the desired size, style, and orientation, and then fills in the object with dots at the specific resolution of the printing device.

Several Apple LaserWriter printers support PostScript. PostScript fonts are also used in combination with bitmap fonts to support additional fonts on the Macintosh.

To use PostScript fonts with system software version 7.1and later, install bitmap and PostScript fonts in the Fonts folder. You can drag fonts or font suitcases to the closed System Folder; the system presents a dialog box asking wether you want to place them in the Fonts folder. Click OK.

In system software versions 7.0 or 7.0.1, install bitmap fonts by dragging a font suitcase or font file onto the closed System file. Put PostScript fonts in the Extensions folder.

For versions of System 6, use Font/DA Mover to install bitmap fonts into the System file and put PostScript files into the System Folder.

TrueType Font

TrueType fonts (also called variable-size, outline, or scalable) describe a typeface without rigidly specifying a size, and thus look good regardless of the size you choose. A TrueType font is a representation of a certain font defined by a scalable outline. Your Macintosh uses this outline to generate the size of the font you require. TrueType fonts provide sharp text at any size on any device, whether screen or printer. The TrueType font format is an open-industry standard, so you can mix and match TrueType fonts from various font vendors.

TrueType fonts are mathematical descriptions of text characters that store individual characters as a series of lines and curves, rather than a group of pixels (a bitmap). When an application asks for a character in any size, such as 33 point, the Macintosh enlarges this outline to 33 point and fills in the dots for the display or printer output.

Macintosh computers must be using System 6.0.7 or later to work with TrueType fonts. To use TrueType fonts with System 6, be sure you have at least 1MB of RAM, install version 6.0.7 or later, and install the TrueType INIT. Install the fonts using Font/DA Mover version 4.1.

Versions of System 7 and later don't require the TrueType INIT and the Font/DA Mover. Drag TrueType fonts onto the closed System folder, and system software version 7.1 and later places fonts in the Fonts folder. TrueType is fully compatible with all Macintosh hardware. As part of

the operating system of the Macintosh, it is transparent to the user, making it easier to use and to manage fonts.

TrueType prints on most devices, including PostScript devices. Very little has changed about printing in versions of System 7 and later. Apple provides a TrueType core set that maps to the internal fonts in printer ROM, as they did in System 6. When you print a page that uses a third-party TrueType font, the LaserWriter driver sends the TrueType font and the TrueType scaling software to the printer. This ensures the best match to the screen display, because the printer uses the same font and scaling software.

Low-cost, non-PostScript printers (such as the Personal LaserWriter LS, StyleWriter, HP DeskWriter, and so on), used with a Macintosh computer, can produce excellent type quality with System 7 (or later) and TrueType fonts. Also, direct-connect printers, driven by QuickDraw and TrueType, print with good type quality.

You can recognize TrueType fonts by these characteristics:

1. Multiple letters on the icon TrueType fonts have a scaling "A" shown on their icons.
2. There's no point size in the name.

Using TrueType with PostScript

PostScript is a page-description language, and TrueType is a font technology. They aren't interchangeable. However, if a file requires a PostScript font not available in LaserWriter ROM nor in the System Folder, PostScript can use the available TrueType font to print. Using the TrueType font requires additional processing, and can reduce LaserWriter efficiency.

TrueType fonts don't necessarily take more disk space than PostScript Type 1 fonts. Comparing the size of the downloadable Type 1 font to the size of the TrueType font isn't an accurate comparison, because a raw Type 1 font doesn't work on the Macintosh without the bitmap fonts and metrics contained in the screen font suitcase. When the suitcase is considered, PostScript fonts and TrueType fonts typically occupy about the same space.

TrueType fonts have the potential to become larger in point size than PostScript Type 1 fonts, due to the enhanced functionality offered by the technology. Many high-quality headline typefaces aren't offered in PostScript form, because of limitations in the Type 1 technology -- such as the number of points or contours in a character.

The core set of TrueType fonts (Times, Helvetica, Courier, Symbol, Avant Garde, Bookman, New Century Schoolbook, Palatino, Zapf Chancery, and Zapf Dingbats) have the same metrics as the fonts in the Apple's PostScript LaserWriters.

Using TrueType with Bitmap

Bitmap screen fonts come installed with TrueType fonts on systems using System 7 and later to maintain compatibility with documents created on Macintosh systems that don't have TrueType fonts. If a document uses a font family and size that's available as both a TrueType font and a bitmap font, the Font Manager uses the bitmap font when the application opens the document. If you want the Macintosh to use the TrueType font, you must remove the bitmap font from your system.

For example, if a document uses Times 12, available in that size as a bitmap and as a TrueType font, the system uses bitmap. If a document uses Times 4, the system scales the TrueType font to that size because a bitmap version isn't available.

Using only TrueType fonts produces a closer match between appearance of type on the screen and the printed page. However, any existing documents created with the bitmap fonts will be reformatted with the TrueType fonts, and line breaks in these documents may change. A document created on a system that has TrueType or the Adobe Type Manager installed will have different spacing, kerning, and so on, when opened on a system that doesn't have TrueType or the Adobe Type Manager.

What You Should Use

TrueType and PostScript fonts can be used at the same time. However, don't have both versions of the same font installed. Helvetica, for example, is available in both TrueType and PostScript, so you should decide on one to avoid needless duplication. This table shows what you can expect depending on what kind of font and what kind of printer you have:

Font Type	Screen	Non- Postscript Printer	Postscript Printer
TrueType	Smooth	Smooth	Smooth
Postscript without ATM	Jagged	Jagged	Smooth
Postscript with ATM	Smooth	Smooth	Smooth
Postscript Only (see note below)	No Text	No Text	Smooth
Note: If you have a PostScript font ONLY (no truetype or bitmapped font) and you do NOT have Super Adobe Type Manager, you get no text on the screen and no text on a non-PostScript printer.			

How the Macintosh Displays Fonts on the Screen

These are the steps your Macintosh goes through to display your request on screen:

1. The System Software checks to see if there is a bitmap of the font you want in the exact point size you requested; if found it displays it.
2. If the requested point size is not present, it looks for the TrueType version of the font, which is used to generate the requested point size and then displayed.
3. If the TrueType version of the font is not present, the System Software scales the largest point size available to the requested size and displays it. This is when you see the jaggies on your screen.
4. However, if Adobe Type Manager is present, it steps in. If the PostScript printer file of the requested font is also present, Adobe Type Manager generates the requested point size and then pass it on to the System Software to be displayed.

The 128 Font Limit

Only font files and suitcases count toward the 128 limit. Printer files do not, because they are not resources loaded by the System. Drag any loose font files onto a suitcase and/or combine suitcases by dragging them on top of each other. If you want to make an empty suitcase, simply duplicate any suitcase, open it, and throw away the contents.

Font Corruption

Sometimes a font can become corrupted. The most obvious symptom of this is that it cannot be removed or causes your Macintosh to become unresponsive ("crash") when you choose it. In System 7 and later you can check for font corruption by attempting to open a suitcase or font file. An error message stating that it cannot be opened means you need to replace that suitcase or font from your original disks. In System 7.1 and later, if you get an error message trying to pull a font or suitcase out of the Fonts folder, first make sure you have quit all running applications. Then, drag the Fonts folder out of the System Folder onto the Desktop. You should now be able to remove corrupt font or suitcase. When you're finished, put the Fonts folder back in the System Folder.

Just Drag and Drop

Most font-related problems come from missing pieces; a quick check to make sure everything is installed properly usually results in a quick fix. In System 7 and later, the easiest way to make sure the different components wind up in the right place is to simply drag each item on top of the System Folder icon; the System places things where they need to be for you. Remember not to drag a folder on top of the System Folder; the items inside are not moved to where they need to be.

Viewing Your Fonts

To see what fonts you have installed:

- For versions of System 6, use the Font/DA Mover.
- For versions of System 7 before 7.1, open the System file as you would any other file.
- For system software version 7.1, open the Fonts folder within the System Folder.

If you have a version of System 7 or later, you can see samples of the fonts. Open the font file, and a window appears displaying the font.

Mac OS: Cannot Move Damaged Font Suitcase out of Fonts Folder

A damaged font suitcase cannot be moved out of the Fonts folder in the usual way. This article offers two procedures for eliminating a damaged font suitcase.

This article has been archived and is no longer updated by Apple.

Symptom

When you attempt to move a damaged font suitcase out of the Fonts folder, an alert message appears. For example, trying to move a damaged font suitcase named "New York" to the desktop causes an alert box to be displayed with the message, "You cannot move 'New York' to the 'Desktop', because it is damaged."

Solution

Follow one of these procedures to remove a damaged font suitcase from the Fonts folder.

Create a New Fonts Folder

1. Open the System Folder.
2. Drag the Fonts folder to the desktop.
3. Restart the computer; a new Fonts folder is created within the System Folder.
4. Drag the known-good font suitcases from the Fonts folder on the desktop to the new Fonts folder within the System Folder.
5. Drag the Fonts folder on the desktop, which contains the damaged font suitcase, to the Trash.

Start up from Another Volume

1. Start up from another volume, such as a Software Installation CD-ROM disc, or another hard disk.
2. Open the Fonts folder containing the damaged font suitcase.
3. Drag the damaged font suitcase to the Trash.

LaserWriter: Checking Hard Drive Capacity

How can I check the capacity of a SCSI hard drive attached to an Apple Laserwriter printer? Can I use the Apple LaserWriter Utility 7.4 to do this?
This article has been archived and is no longer updated by Apple.
There are two ways to check the capacity of a SCSI hard drive attached to a hard-drive compatible Apple LaserWriter:

* Use a PostScript program (listed at the end of this article) to check the hard drive's capacity. This works with any hard-drive compatible LaserWriter.

* Connect the hard drive to a Macintosh. This only works if your hard drive is formatted in Macintosh-compatible format, as with the LaserWriter IIf, IIg, and the LaserWriter Pro 630.

Unfortunately, there is no option to check the capacity of any Laserwriter printer's hard drive in any version of Apple's LaserWriter Utility. The LaserWriter IINTX, LaserWriter IIf and IIg, and the LaserWriter Pro 630 are all hard-drive compatible, but they use different types of hard disk formatting.

The LaserWriter IINTX uses the LaserWriter Font Utility to initialize attached SCSI hard disk drive(s) as one logical disk device for the PostScript file system. The LaserWriter IINTX regards all attached hard drives as a single logical unit, therefore these drives are not recognized by the Macintosh file system.

The LaserWriter IIf and IIg, and the LaserWriter Pro 630 use the LaserWriter Utility to initialize attached SCSI hard drives. This utility initializes the hard drive in a Macintosh compatible (HFS) format and supports the PostScript file system.

Here is a simple PostScript program that displays the total and free space available on a LaserWriter's hard drive:

```
/Helvetica findfont 14 scalefont setfont
statusdict begin
30 100 moveto
(A page is 1024 bytes.) show
30 115 moveto
(The total number of pages are) show
diskstatus
10 string cvs show
30 130 moveto
(The number of free pages are) show
10 string cvs show
showpage
```

Cut and paste these 12 lines of code to TeachText and download the file with the appropriate utility.

WARNING:
If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

Energy Star: Registered Apple Products

This article lists the Apple products introduced prior to 1997-11 that are Energy Star compliant and are registered with the United States Environmental Protection Agency. For additional information on Energy Star see article 12346: "**Energy Star: Description**". For Apple products introduced 1997-11 or later, see technical document 86193, "**Energy Star: Registered Apple Products, Part 2**".

This article has been archived and is no longer updated by Apple.
Many of these products require the installation of separate software in order to take advantage of the energy saving features. Check with the product user's guide for use, installation, and setup of the energy saving features.

Mac OS 7, 8, and 9: How To Take A Snapshot Of Your Screen

This article describes a way of capturing a picture of what appears on your screen, including the menu bar, trash can and all open windows that are visible.

This article has been archived and is no longer updated by Apple.

Press These Keys	To Do This...
Command-Shift-3	Create a picture file of the entire screen.
Control-Command-Shift-3	Copy entire screen capture to Clipboard instead of saving it as a file.
Command-Shift-4	Create a picture file of a rectangular section of the screen. (After pressing and releasing the key combination, drag across the part of the screen you want to take a picture of.)
Control-Command-Shift-4	Copy selected portion of screen to clipboard instead of saving it as a file.
Command-Shift-Caps Lock-4	Create a picture file of a window. (After pressing and releasing the key combination, click the window you want to take a picture of.)

Each screen shot is saved in the PICT file format at the top (root) level of your hard drive directory and labeled "Picture 1". If you keep taking screenshots, you will get "Picture 2", "Picture 3", and so on.

Mac OS: Troubleshooting Type 1, Type 2, and Type 3 System Errors

This article offers tips for troubleshooting system errors of Type 1, Type 2, and Type 3.

This article has been archived and is no longer updated by Apple.

Symptom

An application stops responding, and the following error message is displayed: "Sorry, the application 'Application Name' unexpectedly quit because an error of type (1, 2, or 3) occurred."

Solution

Type 1, 2, and 3 errors are Mac OS memory-addressing errors. These are usually caused by incompatible software or software conflicts.

System software compatibility issues usually occur with older software. If your software falls into this category, contact the software vendor for an updated version of the software that works with your installed system software version.

Software application memory allocation may need to be increased to resolve the issue. See document 56042: "**Mac OS: Troubleshooting Out of Memory Errors**".

Software conflicts most often involve faults with extensions and control panels. Depending on which version of system software you have, you can troubleshoot these items in the following way:

System 7.0 to System 7.1.2

1. Restart your Macintosh computer with the Shift key held down until you see the message "Welcome to Macintosh, Extensions off". This procedure temporarily turns off all non-essential extensions and control panels.

2. Try to recreate the failure. If the failure does not reappear, then you have an extension conflict. Go to Step 3.

    - If the failure continues to occur it is probably not related to any third party extension or control panel. You may need to contact the software vendor to upgrade your application.

3. To determine which of your extensions or control panels is causing the failure, create a folder on your desktop and place all your non-Apple extensions and control panels in that folder and restart your computer.

4. One by one, place the items back into your System Folder, restarting and attempting to recreate the failure every time you add an item. When the failure reoccurs, then you know that either the last item you added, or a combination of the items you have added, is causing your conflict. Contact the vendor of the extension or control panel to see if there is an updated version available.

System 7.5 through Mac OS 9

1. Restart your Macintosh and hold down the Space Bar until the Extensions Manager control panel opens.

2. Use the pop-up menu in the Extensions Manager to choose "All Off". Close the Extensions Manager control panel.

3. Try to recreate the failure. If the failure does not reappear, then you have an extension conflict. Go to Step 4.

    - If the failure continues to occur, it is probably not related to any extension or control panel, you may need to contact the software vendor to upgrade your application.

4. Restart your Macintosh and hold down the Space Bar until the Extensions Manager control panel opens. Turn on groups of extensions and control panels by clicking to the left of each item to put a checkmark by the item. Close the Extensions Manager control panel.

5. Try to recreate the failure.

Repeat Steps 4 and 5 until you have isolated the conflict to a single extension or group of extensions.

You can attempt to remedy a conflict by changing the loading order of a given extension or control panel by locating the file in the System Folder and adding a space or spaces to the front of the file's name. There are also third party utilities that allow you to test and manage extensions and

control panels.

For related information on troubleshooting Type 1, 2, and 3 System errors, please see article 30725: "**Macintosh: Random Behaviors When No Printer is Chosen**"

About a monitor‘s contrast and brightness

Brightness
Brightness adjusts the overall level of the screen. The relationship between the level of white and black, or of colors, does not change; that is, white is still white, black is still black, and yellow is still yellow. The brightness control either dims or brightens the entire screen. There is very little change in the screen when the brightness is adjusted.
This article has been archived and is no longer updated by Apple.
Contrast
The contrast adjustment controls the overall gain of the video amplifier. Adjusting the contrast to its maximum "on" position will make the whites appear whiter and the blacks appear blacker. Contrast will make both white and black (also colors, if applicable) move toward each other, i.e. makes the relationship between the white level and the black level change. Turning the contrast down will tend to make both the whites and the blacks look gray. You will see a large swing from very light to very dark when adjusting contrast (the screen will appear to get darker or lighter).

Example:
Consider a room that is painted half black and half white. It has two controls, one for brightness and one for contrast.

If the brightness control is adjusted, it acts like a light dimmer, controlling whether the amount of light in the room brightens or darkens. However, the black half of the room stays black and the white half of the room stays white. There is just less light in the room.

If the contrast control is adjusted, the relationship between the black and white colors of the room actually changes. When the contrast is turned down, the white half of the room will actually become grayer or move toward black, and the black half of the room will become grayer or move towards white; making it harder to differentiate between black and white, as they both now look the same (gray). Turning the contrast up will make a greater difference between the black and white colors, which makes it easier to differentiate between black and white.

World Power Differences Can Limit International Product Use

This article is about using an Apple product outside of its country of purchase, particularly where the electrical power is different.

Find the electrical specifications for an Apple product by click this link: http://www.info.apple.com/applespec/ to go to the Apple Spec Database. This article has been archived and is no longer updated by Apple.

Overview

Apple products that can be used outside of their country of purchase can be categorized into three classes: those that accept a range in voltage, those that accept a range in frequency, and those that accept a range in both voltage and frequency. Knowing the power requirements of a specific product and the characteristics of the electrical power in the foreign location where you plan on using it will help you to determine if you can use your Apple product there.

Universal

These products can be used internationally out of the box. Some of Apple's products are self-configuring devices or "universal" within a certain range. They can accept a range in both voltage and frequency, and only require a plug adapter for the specific locale.

Example: The Apple Power Macintosh G3 accepts 100 V to 240 V, 50 Hz to 60 Hz.

Frequency Independent

These products can be used internationally with a voltage transformer. Generally, they are designed for 120 V power, but are flexible as to the frequency they accept (for example, 47 Hz to 63 Hz) They are known as "frequency independent." These products require a step-down isolation transformer to adapt the voltage, but handle the different frequency on their own.

Example: The North American Apple LaserWriter 8500 accepts 100 V to 120 V, 50 Hz to 60 Hz.

The Apple LaserWriter 8500 uses a switching power supply that works independently of the input frequency. The European and Australian input frequency standard of 50 Hz do not adversely affect this printer. You can use the Apple LaserWriter 8500 overseas with a voltage converter (isolation transformer).

Frequency Dependent

These products generally cannot be used internationally because they only work within a narrow range in frequency. They are "frequency dependent." Transformers or converters only transform voltage, so if the product requires a certain frequency, there's no practical way to convert both voltage and frequency.

These products can be used internationally only in countries with the same frequency as the country for which the product was manufactured. Further, a voltage transformer is required if the destination country has a voltage different from the home country.

Example: The North American Apple Color StyleWriter 2500 accepts 120 V, 60 Hz.

Important: Desktop computers with power outlets for peripherals do not condition the voltage as it passes through. So, a monitor requiring 120 V, 60 Hz power cannot be used in a 220 V, 50 Hz environment even if the computer from which it gets its power is able to accept the local power.

Apple Products

Universal Devices

The majority of Apple's products manufactured after the Macintosh SE (1987) are self-configuring or "universal" between 100 V and 240 V, 50 Hz to 60 Hz. Usage in countries within these ranges may only require a plug adapter. Note that some Apple products have a voltage selector to select between 110 V and 220 V. For these products, you must select the correct voltage before plugging them in.

To verify if a specific product is universal, check its label for the voltage and frequency requirements, or the Apple Spec Database at http://www.info.apple.com/applespec/.

Voltage-Dependent Devices

The Apple products designed to operate at a line voltage ranging from 107 V to 137 V at 50 Hz or 60 Hz (cycles per second) are considered to be voltage-dependant. If the destination country uses a line voltage of 220 V, and the product only accepts 120 V, you'll need a 220 V to 110 V stepdown isolation transformer. This type of transformer is the only one known to give a clean signal.

The transformer's wattage should be 150 percent of the total wattage of the system (computer, monitor, hard disk, printer, and so forth). For example, if the system consumes 250 W of power, use a transformer rated for a minimum of 375 W. A 500 W transformer should be sufficient for an entire Apple system (computer, monitor, and printer). It must also have a third prong for a grounded outlet. Electrical shock to you, or damage

to the hardware may occur if the products are not correctly grounded.

Non-universal Apple power supplies function correctly with voltages between 107 V and 132 V. If line voltage fluctuates outside these specifications, you need to use a power conditioner to ensure uninterrupted operation of your Apple equipment. Operating without the conditioner will probably not result in damage to the hardware, although the voltage fluctuation may cause your computer to be unresponsive. In such an event, you will lose any data in memory and may even lose data stored on disk.

Frequency-Dependent Devices

If the country uses a line frequency other than 60 Hz, then all AC-powered devices attached to your computer system (monitors, printers, and so forth) must be "frequency independent." That is, they must be able to operate on a line frequency of either 50 Hz or 60 Hz. A majority of Apple products are frequency independent, but check the specifications of all equipment prior to using it.

Traveling Tips

When traveling with a computer, protect it from shock, heat, moisture, radiation, and theft. Special hard-shell shipping cases are advertised for most Apple products. These cases can protect computer products from environmental abuse. In addition, they often do not look like computer cases, and usually escape the notice of thieves.

X-rays and other magnetic radiation associated with X-ray machines only pose a slight potential danger. Most airports X-ray all luggage. If the risk in losing software or data is too high, back the files stored on your computer's hard disk.

Due to concern about computers and floppy disks going through security scanners at airports, the American Society for Testing and Materials (ASTM) conducted a study on X-ray induced damage to memory devices, including audio and video tapes and floppy disks. They found that the devices usually have enough shielding to protect the media. The study found that the magnetic field was actually strongest around the scanner's monitor. They taped a disk to the monitor for several hours without damage. A committee member suggested that it would take at least 1000 million passes through the machine before any damage would be evident.

VGA Monitors: Which Macintosh Models Are Compatible

This article explains which Macintosh computers introduced before November 1997 work with VGA monitors.

For computers introduced since November 1997, see technical document 86183, "**VGA Monitors: Which Macintosh Models are Compatible, Part 2**".

This article has been archived and is no longer updated by Apple.
Most Macintosh computers work with VGA monitors, including:

Macintosh LC Computers
LC
LC II
LC III
LC 475
LC 630

Performa Comptuers
Performa 400, 405, 410, 430
Performa 450
Performa 460, 466, 467
Performa 600
Performa 630 series

Centris/Quadra Computers
IIvx/IIvi
Centris/Quadra 610
Centris/Quadra 650
Centris/Quadra 660AV

Quadra Computers
Quadra 605
Quadra 700
Quadra 800
Quadra 900
Quadra 950
Quadra 840AV
Quadra 630

Power Macintosh Computers
Power Macintosh 5200 series
Power Macintosh 6100 series
Power Macintosh 6200 series
Power Macintosh 6300
Power Macintosh 7100 series
Power Macintosh 7200 series
Power Macintosh 7600
Power Macintosh 8100 series
Power Macintosh 8500 series
Power Macintosh 9500 series

PowerBook Computers
PowerBook 160
PowerBook 165c
PowerBook 180
PowerBook 180c
PowerBook 190 Series - Must have external video upgrade
PowerBook 500 Series
PowerBook Duo (with MiniDock or Duo Dock)
PowerBook 2400
PowerBook 3400
PowerBook 5300 Series

Making the Connection

TA21581_VGA_Monitors_Which_Macintosh_Models_Are_Compatible_(TIL12917).pdf

To connect a VGA monitor to the Macintosh video port, an cable adapter may be required. Third-party cable vendors should have these adapters available for purchase. More recent Macintosh computers use a VGA-style connector and do not need an adapter. Refer to your computer's owner guide or Mac OS Help for additional information on connecting a VGA monitor to your computer. For information on display adapters, see technical document 33001, "**Display Adapter Table**".

VGA monitors may have variances when purchased from different VGA monitor vendors. It is best to test a monitor for compatibility with your Macintosh before making a purchase decision. VGA monitors also have different image quality specifications. There may be significant differences between Apple monitors and various VGA monitors. A side-by-side review of the monitors should be done before deciding which monitor to buy.

PowerBook Displays: Active Matrix and Passive Matrix Compared

This article compares active matrix and passive matrix LCD displays used in PowerBook and iBook computers.
This article has been archived and is no longer updated by Apple.
Liquid Crystal Display (LCD) is the technology used on the screens of PowerBook and iBook computers. LCDs are non-emissive (no extra low frequency (ELF) or very low frequency (VLF) emissions); they do not create their own light, but reflect and block light. LCDs use a reflector, backlight, sidelight, or a combination of a reflector and back/sidelight to display an image.

The main difference from a cathode-ray tube (CRT) display is that the pixel (the little dots of light that comprise the picture on a computer or TV screen) is not the source of light. A typical LCD consists of a reflector, rear polarizer, back glass, liquid crystal material, front glass, and front polarizer.

The liquid crystal material is a liquid with rod-shaped molecules inside. The rod-shaped molecules can form a twisting helix, or spiral pattern and bend light that enters the display. When electric current is applied, the rods straighten out and no longer bend the light. The inside surfaces of the glass are treated and polished to induce the rod-shaped molecules in the liquid crystal material to line up with the polarizers.

The display uses two polarizers to line up the light and reduce glare. If the light is out of phase, it can not pass through the polarizer. By using two polarizers 90 degrees out of phase with each other, the light is blocked. The liquid crystal material bends the light 90 degrees so it will pass through the polarizer. When the LCD has power to it, it does not bend the light, hence it does not pass through the polarizer.

This type of display is called an active matrix, or Thin-Film Transistor (TFT), display. Passive matrix, or Film SuperTwist Nematic (FSTN), displays are similar to TFT displays, but the liquid crystal molecules in a SuperTwist Display bend or twists light much farther than in a standard TFT display. In fact, the molecules in a SuperTwist display can bend 270 degrees or more to transmit light. One difference you may notice between passive and active matrix screens is that active matrix has a much wider viewing range than passive matrix. In other words, you can see information displayed on the screen from a wider side angle on an active matrix display than on a passive matrix display.

Passive Matrix

In a passive matrix, or FSTN, display a grid of electronic control wires or lines are placed on the front and back glass. A pixel is located at the junction of each row and column control lines. Passive matrix displays use one transistor to address each row and one to address each column of pixels. Pixels are turned on when both row and column lines are energized and off when both control lines are de-energized. This addressing scheme is called multiplexing.

The residual electrical current that travels down each control line can cause crosstalk at unselected pixels. Crosstalk partially darkens pixels and lowers the display's overall contrast. This usually appears on a passive matrix PowerBook display as two dark boxes, parallel to each other on the display.

Active Matrix

The active matrix, or Thin-Film Transistor (TFT) display is the latest technology used in Macintosh PowerBook computers. Rather than using multiplexing (row and column wires on the glass) techniques to address the matrix of crystals, the active matrix LCD includes a transistor fabricated along with each pixel. You can think of the display as one large Integrated Circuit (IC), with the transistors acting as switches to turn on individual pixels. (An IC is a slice or chip of material on which is etched or imprinted a circuit comprised of electronic components and their interconnections.) Because of the transistors, pixels can be turned on and off at a very fast rate. The transistor at each pixel eliminates the crosstalk phenomenon, which lowers contrast on an FSTN display.

The TFT method eliminates the time dependency associated with multiplexed displays by directly addressing each pixel.

The following charts which PowerBook models have active matrix or passive matrix displays:

PowerBook Model	B&W/Color/Grayscale	Display Type
100	B&W	Passive
140	B&W	Passive
145	B&W	Passive
145B	B&W	Passive
150	Grayscale (4 Grays)	Passive
160	Grayscale (16 Grays)	Passive
165c	Color (256 Colors)	Passive
170	B&W	Active
180	Grayscale (16 Grays)	Active

180c	Color (256 Colors)	Active
190	Grayscale (16 Grays)	Passive
190cs	Color (256 Colors)	Passive
520	Grayscale (16 Grays)	Passive
520c	Color (256 Colors)	Passive
540	Grayscale (16 Grays)	Active
540c	Color (256 Colors)	Active
1400cs	Color (thousands of colors)	Passive
1400 c	Color (thousands of colors)	Active
5300	Grayscale (16 Grays	Passive
5300c/100 8/500	Color (256 Colors) (2)	Active
5300c/100 16/750	Color (thousands of colors) (2)	Active
5300cs	Color (256 Colors)	Passive
5300ce	Color (thousands of colors)	Active
Duo 210	Grayscale (16 Grays)	Passive
Duo 230	Grayscale (16 Grays)	Passive
Duo 250	Grayscale (16 Grays)	Active
Duo 270c	Color (256 Colors) (1)	Active
Duo 280	Grayscale (16 Grays)	Active
Duo 280c	Color (256 Colors) (1)	Active
Duo 2300c	Color (256 Colors) (1)	Active
2400c	Color (thousands of colors)	Active
3400c	Color (thousands of colors)	Active
G3	Color (thousands of colors)	Active
G3 Series	Color (thousands of colors)	Passive
G3 Series	Color (millions of colors) (3)	Active
G3 Series (Bronze Kbd)	Color (millions of colors)	Active
G3 Series (FireWire)	Color (millions of colors)	Active
G4 - all models	Color (millions of colors)	Active
iBook - all models	Color (millions of colors)	Active

Notes:

1. Thousands of colors in 640 by 400 resolution
2. The PowerBook 5300c computer is available in two configurations. One model has 512K of built-in VRAM, the other has 1 MB.
3. Also available in 30 cm STN passive display.
4. Some of the descriptions in this table only apply to computers sold in the United States.

Macintosh: How to Copy or Initialize (Format) a Floppy Disk

How do I copy a floppy disk? How do I initialize or format a floppy disk?
This article has been archived and is no longer updated by Apple.
If your Macintosh has two floppy-disk drives:

1) Insert the disk to be copied in one drive, and the disk you want to copy to in the other drive.

2) Drag the icon of the original disk onto the icon of the "target" or destination disk.

3) You'll be asked if you want to completely replace the contents of the target disk with the contents of the original. Click Yes to continue.

Note: This will replace, not add to, everything that was on the disk you are copying to.

If your Macintosh has only one floppy-disk drive:

1) Insert the disk to be copied in the floppy disk drive.

2) Press Command-E to eject the disk. Its icon will remain on the desktop, but as a dimmed, or grayed-out shadow.

3) Put the disk you want the new copy on in the floppy disk drive. It may be a disk you have used before, or a new, uninitialized disk. If it is uninitialized, click Initialize to format the disk.

4) Drag the icon of the dimmed floppy disk over the icon of the disk you just inserted in the drive.

5) You'll see a warning dialog box that asks if you want to completely replace the contents of the new disk with the contents of the original. Click Yes to continue.

Note: This will replace, not add to, everything that was on the disk you are copying to.

6) You'll be asked to insert disks as needed as the computer makes your copy.

Note: You can stop the copying process at any point by pressing "Command-." (Command-period). You may have to press this key combination more than once.

Video Technologies: Composite versus S-video

What is the difference between composite video and S-video? Also, which Macintosh computers support these video technologies?
This article has been archived and is no longer updated by Apple.

Composite Video

A composite video signal is one in which the luminance, chrominance, and sync information have been combined into a single signal using one of the coding standards: NTSC, PAL, SECAM, and others. This is the form the signal must take before it can be broadcast or recorded by standard means. Composite video is more common than S-video, as televisions, most video- cassette recorders (VCRs), and laser disc players (LDPs) use the composite format.

Chrominance
The color part of a signal, relating to the hue and saturation but not to the luminance (brightness) of the signal. Any colored signal has both chrominance and luminance.

Luminance
The aspect of the video signal carrying information about the brightness of an image.

Sync
Short for synchronous. Refers to signals used to synchronize the horizontal and vertical scans of a video signal. This signal is derived from a composite or combination of horizontal and vertical drives, with some slightly narrowed and delayed pulses as well as the addition of equalizing pulses. When used, is usually accompanied by subcarrier.

S-video

An S-video signal is a consumer form of component video. It is used primarily with Super8 (Hi8 video or 8 mm tape) camcorders and S-VHS recorders (S-video on VHS tape). S-video is a less common -- but higher quality -- video format than composite video.

Component video

Component video is a recording system that does not require NTSC encoding of RGB signals, but uses a means of recording and routing the luminance and color signals separately. This method does not reduce bandwidth nor compromise the RGB components and results in images of higher resolution and better color quality than composite video. Though designed for high-end television production, similar recording methods have recently become available to the consumer market.

Video support

The following Macintosh computers support both composite video and S-video input and output:

Computer	Composite video	S-video
Macintosh Quadra 660AV	Yes	Yes
Macintosh Quadra 840AV	Yes	Yes
Power Macintosh 6100AV series	Yes	Yes
Power Macintosh 7100AV series	Yes	Yes
Power Macintosh 8100AV series	Yes	Yes
Power Macintosh 7500 series	Yes	Yes
Power Macintosh 7600 series	Yes	Yes
Power Macintosh 8500 series	Yes	Yes

The Macintosh Quadra 660AV and 840AV and the Power Macintosh 7500, 7600, and 8500 series computers have separate connectors for composite and S-video. The Power Macintosh 6100AV, 7100AV, and 8100AV series computers have S-video input and output connectors but require an adapter for composite video input and output.

Video Signal: Composite vs. Component

This article defines composite and component video.
This article has been archived and is no longer updated by Apple.

Component video

A term gave to a recording system which does not require NTSC encoding of RGB signals, but uses a means of recording and routing the luminance and color signals separately. This method does not reduce the bandwidth nor compromise the RGB components and results in images of higher resolution and better color quality than composite video. Though designed for high end television production, similar recording methods have recently become available to the consumer market.

Composite video

A composite video signal is one in which the luminance, chrominance and sync information have been combined into a single signal using one of the coding standards: NTSC, PAL, SECAM, and so forth. This is the form the signal must take before it can be broadcast or recorded by standard means. Until recently, most monitors and projectors have accepted only composite video signals, although many now available accept RGB. See NTSC. Compare component video.

The NTSC composite signal format is required for most video recording, manipulation, and display in the United States. The exception is the high-end post-production facilities that use component video for improved signal integrity.

NTSC Composite vs. Component

In a composite signal, the luminance signal and the color signals are encoded together into one signal. When the color components are kept as separate signals, the video is called component analog video (CAV), which requires three separate signals: the luminance signal (Y) and the color difference signals (R-Y and B-Y).

Because component video does not undergo the encoding process, the color quality is noticeably better than composite video.

TA21586_Video_Definitions_NTSC_PAL_SECAM_(TIL13074).pdf

Video Definitions: NTSC, PAL, SECAM

There are currently three standards in the world for composite, color encoded video: NTSC, PAL and SECAM. Standards exist for High Definition Television (HDTV), however, this article will only discuss the broadcast formats currently in wide use.
This article has been archived and is no longer updated by Apple.

NTSC

NTSC represents the National Television System Committee of the Electronics Industries Association, the organization which defined the standard format adopted by the FCC for broadcast television in the United States. NTSC is also the standard used in Japan, Canada, and Mexico.

"NTSC" is usually taken to mean the NTSC color television system itself, or its interconnection standards. This is also called "composite video" because all the video information* sync, luminance, and color are combined into a single analog signal.

"NTSC" is often said to stand for "Never The Same Color." When color broadcasting first became a commercial possibility, the standard was created to allow color television signals to be compatible with existing black and white television. The restriction of compatibility with the earlier technology results in compromises in color image quality.

PAL

"PAL" stands for Phase Alternation by Line, the broadcast video standard used in West Germany, Great Britain and most Western European nations.

By reversing the relative phase of the color signal components on alternate scanning lines, this system avoids the color distortion that appears in NTSC. Otherwise, PAL closely resembles NTSC. Based on the 50 Hz power system, PAL displays 625 lines interlaced at 50 fields per second (25 frames per second).

PAL is not compatible with NTSC or SECAM, though conversion between the standards is possible. Video products to be used in Europe require compatibility with PAL standards.

SECAM

"SECAM" is an abbreviation for Séquential Couleur à Mémoire, the line sequential color system used in France, Russia, Eastern Europe and some Middle Eastern countries.

Like PAL, SECAM is based on a 50 Hz power system, displaying interlaced lines at 50 fields per second. The color information is transmitted sequentially (R-Y followed by B-Y, etc.) for each line and conveyed by a frequency modulated subcarrier that avoids the distortion arising during NTSC transmission.

SECAM is not compatible with NTSC or PAL, although conversion between the standards is possible.

LaserWriter Driver 8.x: How Auto Select Works

I have had problems using the Auto Select feature of LaserWriter Driver 8.x. The Auto Select option in the Print dialog seems to be ignored randomly, or used randomly when not asked for.
This article has been archived and is no longer updated by Apple.
This article explains the LaserWriter Driver 8.x "Auto Select" feature. However, when following the information presented here, you must first make sure that "Auto Select" is selected as the paper source in the LaserWriter 8.x Print dialog.

Installed and Preferred
This setting only affects print jobs coming from the Macintosh you "Configure". Either the 250-sheet or 500-sheet cassette can be chosen as the default paper tray by selecting the printer in the Chooser, clicking on Setup, and then on Configure. Once the Configure dialog box displays, the 500-sheet cassette can be set for Installed and Preferred, which makes it the default paper tray for that paper size. Thus, if there is Legal-sized paper in the 500-sheet tray, then any Legal-sized print job uses the 500-sheet cassette. If the 500-sheet cassette is set only as Installed, then the default paper tray used is the 250-sheet cassette (for all jobs using the paper size installed in that cassette).

To access the Configure dialog box with LaserWriter Driver 8.2 or greater, you must click on Setup once to select the PostScript Printer Description (PPD) file, and then click on Setup again to get the option for Configure.

PostScript and Default Paper Tray
This affects ALL print jobs coming from ANY Macintosh since the value is modified at the printer, not the client (as in the preceding Installed and Preferred procedure).

You can set any of the paper trays (Multipurpose, 250-sheet, 500-sheet, or Envelope) as the default paper tray by downloading the PostScript code (see PostScript Code on page 10) to the printer. The default tray selected is used automatically for any print jobs of the same paper size as in the default tray that you set.

PostScript Code
Use this PostScript code at your own risk. You are responsible for the support of any problems associated with changing the default tray. You should also inform others using the printer that you have changed the default tray. Changing the default tray on the printer may cause the paper out LED to light if there is no paper present in the default tray, or if the wrong size paper is used in the tray. When this happens, there is nothing wrong with the printer's hardware.

This is PostScript Level 1 code:

```
%=========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin 1 setdefaultpapertray end
%
% end PostScript Code
%=========================================================
```

VALUE TRAY SELECTION

0 250 sheet cassette
1 Multi-purpose tray
2 500 sheet cassette
3 Envelope tray

Note: The VALUE column pertains to the integer preceding the setdefaultpapertray command on the second line in the PostScript code.

This is the equivalent PostScript Level 2 code:

```
%=========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=========================================================
```

This sets the paper tray priority to:

1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.
2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".

For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

Warning: If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

Individual Documents
Tray selection is NOT stored with each individual document, however, page size is. Thus, with "Auto Select" the LaserWriter driver does its best to match the page size with the appropriate tray, depending on how the printer was configured using the preceding procedures.

Sticky Trays?
LaserWriter 8.x DOES NOT automatically use (for the next job) the last paper tray used in the previous job, unless the current print job is of the same paper size as the previous job.

PowerBook: Using SCSI Devices

This article tells how to add peripheral devices to your PowerBook and how to use SCSI Disk Mode, which lets some PowerBook computers connect to a desktop Macintosh and appear as an external hard disk.
This article has been archived and is no longer updated by Apple.
All PowerBook models released up to and including the PowerBook G3 (Bronze keyboard) include an external SCSI port except the PowerBook Duo 200 series. The PowerBook Duo must be connected to a dock of some kind to have a physical SCSI port (SCSI Disk Mode is only supported with the Mini Dock).

The iBook and later PowerBook models do not contain external SCSI functionality. Instead, these models include USB and/or FireWire ports. For information on connecting SCSI devices to these computers, see article 43026: **iMac and iBook: How to Utilize External SCSI Peripherals**

For information on FireWire target disk mode, which has replaced HD target mode on FireWire-equipped PowerBook computers, refer to article 58583: **FireWire Target Disk Mode**

If you are still unsure as to what ports are available on your model of PowerBook, consult the documentation included with your computer or Apple product specifications at http://support.apple.com/specs/powerbook/.

The SCSI Port and Cabling

The SCSI port used in PowerBook computers is called an HDI-30. It is a square connector with 30 pins. There are two different SCSI cables. In addition to one of these cables, you may need a terminator, model number M3503xx/A (in the US all model numbers are LL, thus the terminator would be M3503LL/A). Refer to article 24281: "**PowerBook: SCSI Cables Used**" for images of the various cables.

Apple HDI-30 SCSI Disk Adapter
This adapter, model number M2539xx/A is specifically for SCSI Disk Mode, also known as HD Target Mode. It can be distinguished by its HDI-30 connector having 30 pins (5 rows of 6). The connector on the other end is a standard Centronics 50 connector.

Apple HDI-30 SCSI System Cable
This cable is for connecting external SCSI devices, like CD-ROMs and hard drives, to your PowerBook and it is called the Apple HDI-30 SCSI System Cable, model M2538xx/A. Its HDI-30 connector only has 29 pins. The connector on the other end is a standard Centronics connector.

SCSI Disk Mode (HD Target Mode)

This mode enables the PowerBook hard drive appear on the Finder desktop of the host Macintosh it is connected to. This mode is supported on all PowerBook models with the exception of the 140, 145, 145B, 150, and 170 and is recommended for high speed transfer of information, but is not necessarily intended for long-term usage.

On PowerBook computers equipped with IDE hard drives, such as the PowerBook G3 Series, this functionality is called HD Target Mode though functionally it is the same. Follow these steps to set up SCSI disk mode:

1. In the PowerBook control panel (Portable control panel for the 100) choose the SCSI ID for the PowerBook. Remember, each SCSI device must have a unique ID number. Verify that the hard drive name for the PowerBook is different from the hard drive name of the host computer.

2. Shut down the PowerBook and any additional SCSI devices in the SCSI chain. Attach the HDI-30 SCSI Disk Adapter cable to the PowerBook and a terminator at the other end (the terminator may not be required; check your user manual).

3. Plug the SCSI Disk Adapter cable to either a SCSI cable attached to the desktop Macintosh, or to any existing SCSI device on the SCSI chain.

4. Power on the PowerBook. You should see a diamond shaped symbol moving across the screen with a number corresponding to the SCSI ID you set. Once you see that, power on the desktop computer. After that computer starts up, you should see the PowerBook computer's hard drive appear on the Finder desktop of the host Macintosh.

5. If you find that the host computer does not start up properly, turn both computers off, remove the terminator and then restart both computers.

To end the session, shut down the desktop Macintosh. Then power off the PowerBook pressing and holding the power button for two seconds then releasing. (For the PowerBook 100, press both of the buttons on the left side of the computer.)

Note: The Macintosh Plus and the Macintosh SE without an internal hard disk can use SCSI disk mode. When attaching under these configurations, you do NOT use the terminator between the two SCSI cables.

Adding External Devices

There are many devices that use the SCSI port to connect to your PowerBook. Some examples are hard disks, CD-ROM drives, scanners, and backup devices.

The most important thing to keep in mind when adding devices to a SCSI chain is the ID number. The SCSI chain has an ID range from 0 to 7. ID 7 is reserved for the PowerBook itself; ID 0 is reserved for the internal hard drive on most computers. The other 6 ID numbers are for external devices. Generally, this ID can be set on the device by some external selector -- consult the manual for the device to see how to set this number. The ID number for each device must be unique on the chain. That is, only one device can use a given number. If you are running the Apple System Profiler, the Device Information section will give you more information about which ID numbers are in use.

Officially a SCSI device chain must be terminated at both the beginning and end. Some older PowerBook computers do not supply termination at the beginning of the SCSI chain. Because of this, a second terminator may be needed before the first device in the chain. Check your PowerBook's user manual to determine the placement and quantity of SCSI terminators needed for your PowerBook model in the section titled, "Connecting SCSI devices."

If there is more than one external SCSI device connected in a chain to a PowerBook computer, they can be connected together using the Apple SCSI Peripheral Interface Cable. This cable is a Centronics 50 pin to 50 pin cable. Both the first and last device in the chain need one terminator each, unless one or more of the devices in the chain have termination built in.

Some older SCSI devices are internally terminated. If you are not sure, it is very important that you check the manual for each device. If any of the devices in the middle are terminated, your system will have difficulties seeing all the devices.

Before connecting or disconnecting devices on a SCSI chain, turn the power off for all devices. When you get ready to power up, turn on all external devices first, then turn on the PowerBook. Unpowered device may not supply power to their terminator. When you wish to end the session, shut down the PowerBook first, then turn off all the devices.

Common Problems Q & A

Question: I am attempting SCSI Disk Mode, and the PowerBook does not display the diamond pattern. What is wrong?

Answer: Some PowerBook computers will not show the disk mode icon until the desktop Macintosh is powered on.

Make sure you are using the correct cable. This is the most common difficulty. Refer to the previous Cabling section to verify that you are using the SCSI Disk Adapter cable. Second, be aware that SCSI Disk Mode is only supported in certain PowerBooks. Review the instructions under SCSI Disk Mode to see which PowerBooks are supported.

Be sure to use Apple cables because some third party cables may not have adequate shielding.

Question: I have added an external SCSI device to my PowerBook and when I start up, I get a diamond symbol on my screen. What does this mean?

Answer: You are using the SCSI Disk Adapter Cable instead of the System Cable. See the preceding section on Cabling to see the difference.

Question: I have added an external SCSI device to my PowerBook and when I start up, I get only a flashing question mark (?) over a disk icon. Why?

Answer: Something is preventing your PowerBook from starting up correctly. First, try to start up your computer from its Disk Tools disk or Mac OS system software CD. If it starts up and your hard drive does not appear on the desktop, you may have a SCSI ID conflict. Make sure that the external device is set to an ID number from 1 to 6, and if more than one device is connected, make sure each has a unique ID number. Try opening the Apple HD SC Setup program on the Disk Tools disk or the Drive Setup program on the Mac OS system software CD. If that program can see your hard drive, try selecting the Update button.

This updates the driver software on the hard disk. Check the version of the Drive Setup program. It is possible that a newer version is available which may address your situation. Make sure you are configuring your SCSI chain correctly; refer to the previous section, paying close attention to termination.

Question: In SCSI Disk Mode, the desktop computer tries to start up from the PowerBook computer's drive, rather than its own internal drive. An example is an error message such as the one saying the system software is not correct for this Macintosh. What should I do?

Answer: Power the desktop computer off, and then start up from the Disk Tools disk for that computer. Make sure that both the PowerBook drive and the desktop's internal drive both show up on the screen. Verify that the names of the two drives are different. Open the Startup Disk control panel and verify the desktop computer is selected. Restart and let the Disk Tools disk be ejected; it should then start up from the correct drive.

LaserWriter 8: Printer Driver Version 8.1.1

This document contains important information about the LaserWriter 8 printer driver version 8.1.1. The printer driver is more compatible with Apple printers and non-Apple software than earlier versions of the LaserWriter 8 printer driver.
This article has been archived and is no longer updated by Apple.

Before Installing Printer Driver Software
Before you install LaserWriter 8 software, check the information below about which files in your System Folder will be replaced with newer versions when you install, and what steps you might want to take to keep or remove files:

If You Use System 6
If you use System 6, you may want to make backup copies of your original PrintMonitor and Backgrounder to use if you need the option of sometimes using an older version of LaserWriter driver. (The Installer automatically replaces your original PrintMonitor and Backgrounder with newer versions.)

Drivers Older Than Version 8.0
The Installer doesn't replace versions of the LaserWriter driver that are older than version 8.0. You may remove printer driver files that are older than version 8.0 from your System Folder if you no longer need them.

Drivers For Versions 8.0 or Later
The Installer does remove earlier versions of the LaserWriter 8 driver (for example, version 8.0) and all Apple PostScript Printer Description (PPD) files.

The Installer Places These Files
For System 6, in your System Folder: LaserWriter 8 (version 8.1.1), PrintMonitor (version 7.0.1), Backgrounder (version 1.3), LaserPrep (version 7.2). The Installer also places PPD files for Apple LaserWriter printers in the Printer Descriptions folder in your System Folder.

For System 7, in the Extensions folder: LaserWriter 8 (version 8.1.1), PrintMonitor (version 7.1). It also installs the latest PPD files for Apple LaserWriter printers in the Printer Descriptions folder in your Extensions folder.

Note: Some files on the LaserWriter 8 disks have been compressed (their filenames end with .cmp). You can only install these files with the LaserWriter 8 Installer.

The Installer does not copy the LaserWriter Utility to your computer. You may install the utility by dragging it to your hard disk.

About PPD Files
The LaserWriter 8 printer driver is shipped with PPD files that contain information about specific features of LaserWriter printer models. These files are in the Printer Descriptions folder. PPD filenames indicate the printer model and its version of PostScript.

To take full advantage of your printer's features, follow these tips:

* Select your printer in the Chooser and click the Setup button.

* Click the Auto Setup button in the Setup dialog box. The correct PPD file for your printer is automatically selected.

* If the driver can't find a PPD file that matches your printer, you will be prompted to select one. You may select the generic PPD file, which will work with all LaserWriter printers.

About Creating EPS Files
You can create an Encapsulated PostScript (EPS) file in many applications programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

Creating EPS Files
Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, an extremely large file may be created.

EPS File With No Fonts
If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.

EPS Files With Preview Information
When creating EPS files with preview information included, applications that create their own PostScript code may not display the EPS file accurately on the screen.

Using the LaserWriter 8 Driver
When using the LaserWriter 8 driver, you should be aware of the following situations. Some happen with all LaserWriter printers and others happen only with specific models.

All LaserWriters
The LaserWriter 8 driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text flow in some documents has changed or is clipped to fit the new imageable area.

If you print using A4 size paper, have chosen Manual Feed as the Paper Source, and have a B5 size paper tray installed in your printer, the page will be clipped to match the B5 paper size.

Printing multiple documents with the Finder may not work if the documents have been created by different application programs.

LaserWriter IIg and IIf
When selecting paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.

Some form-printing applications can't print forms using the Layout settings in the Page Setup dialog box.

LaserWriter IINT and IINTX
If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.

Don't use the B5 tray to print envelopes on a IINT. Use the Letter tray instead.

LaserWriter Pro 600 and 630
You can't use Auto Select as the Paper Source in the Print dialog box to print envelopes from the optional envelope feeder.

When you are printing at 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

Personal LaserWriter NTR
When you are printing in the background, no message appears when the printer runs out of paper.

LaserWriter Pro 810
With some graphics applications, bitmap graphics will be reduced by 25% in size when Precision Bitmap Alignment is specified.

Using the LaserWriter 8 Driver with the Kanji System
To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II 7.1.1.

Using the LaserWriter 8 Driver with Application Programs
Some application programs don't yet take advantage of the new features of the LaserWriter 8 driver, or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

Aldus Freehand 3.11
You can't print using Layout options in the Print dialog box. If you choose a layout from the Layout pop-up menu, the document doesn't print and no error message appears.

EPS files created from within Freehand can't be used in other programs.

Selecting the Unlimited Downloadable Fonts option in the Page Setup Options dialog box results in a PostScript error.

Aldus PageMaker 4.2a
You can't scale EPS images in documents printed using the Layout option in the Page Setup dialog box.

Aldus Personal Press 2.0
Using several font style combinations in text can result in spacing problems.

When working with large EPS files in a document, you may need to increase the amount of memory allocated to the application.

Aldus Persuasion 2.1.2
When you print a document that contains gradient fill patterns, the document is printed with solid patterns instead of gradients.

Documents that contain EPS graphics may not print correctly if you select 2-Up or 4-Up printing.

Aldus SuperPaint 3.0
Rotated or filled polygons print as solid gray objects.

Canvas 3.0.6
Printing with substituted fonts may result in incorrect line layout.

CricketDraw III 1.0
You can't import an EPS file created with the LaserWriter 8 driver that has been saved without preview information.

Be sure that enough space is available on your hard disk when printing large documents; otherwise the application may malfunction.

CricketPresents 2.1
You can't import an EPS file created with the LaserWriter 8 driver that has been saved without preview information.

Informed Manager 1.3.5
Shaded headings in a document may not print correctly.

Some documents will print with extra pages.

MacDraft 2.1
When you print using the Cut Marks option, a PostScript error results.

Microsoft PowerPoint
In PowerPoint version 2.01f, you can't import an EPS file created with the LaserWriter 8 driver that has been saved without preview information.

When importing EPS files, you may want to increase the memory allocated to the application.

Microsoft Works 3.0
Printing documents that have rotated objects with rounded corners results in a PostScript error.

More 3.1
When creating EPS files with the LaserWriter 8 driver, be sure you have enough disk space to hold the file. No Disk Full error message appears when your hard disk becomes full and can't hold the entire file.

Publish It! Easy 2.1.9
Use an earlier version of the driver, or contact the publisher of the application program.

QuarkXPress 3.11
You can't print EPS files created by the LaserWriter 8 driver that contain certain TrueType fonts.

Using Calibrated Color results in a PostScript error.

ReadySetGo! 4.5 and 5.0 (DesignStudio)
Use an earlier version of the driver, or contact the publisher of the application program.

Studio/8 and Studio/32
When creating an EPS file with these programs and the LaserWriter 8.0 driver, you must select the QuickDraw Printer option.

Other Troubleshooting Tips

Printer Status Dialog Boxes
When you are printing with some application programs, the Printer Status dialog boxes may appear overlapping or misaligned on the screen, preventing you from canceling printing by clicking the Cancel button. Press Command-Period to cancel printing.

Unexpected Format Results
If you see unexpected format results when you print a document, choose Page Setup and check whether the paper size is shown as Other. If so, select the correct paper size.

Utility Programs That Change Your Printer Without The Chooser
Utility programs that attempt to change your current printer without using the Chooser may produce unexpected results.

Cover Page May Not Print
With some graphics applications, the Cover Page may not be printed at the end of a multi-page document. Use Cover Page: Before Document.

Disk First Aid: What to do when it finds an error

This article has been archived and is no longer updated by Apple.

Learn what to do when Disk First Aid reports an issue with the disk. This document applies to Mac OS 9 and earlier. It does **not** apply to Disk Utility or Mac OS X.

Symptom

After attempting to repair a disk, Disk First Aid reports one or more of the error messages listed below, followed by, "Problems were found but Disk First Aid cannot repair them".

Solution

1. Back up important data from the disk if possible.

2. Start up from CD and use the Repair option of Disk First Aid to try to repair the volume. If Disk First Aid continues to report an issue with the volume, try running Disk First Aid a second or third time to ensure that the disk cannot be repaired by Disk First Aid.

3. If Disk First Aid is not able to repair the disk, consider using a third-party disk utility to try to repair the disk.

4. If Disk First Aid is not able to repair the disk and a third-party utility is either unavailable or unable to repair the disk, back up important data from the disk if possible, and reformat the disk using Drive Setup.

Explanation of selected "error" messages

Message: Missing Thread Record

Disk First Aid reports the following:

- Checking catalog file.
- Problem: Missing thread record, 3499, 160
- Rechecking catalog file.
- Test done. Problems were found, but Disk First Aid cannot repair them.

Meaning

When Disk First Aid reports that the thread for a file is missing and it cannot repair it, this means that it is unable to reconcile the entry for the file in the directory (catalog B-tree) with the location of the file on the volume. This indication can be triggered by the following:

- The file in question may have become damaged and cannot be repaired.
- The catalog B-tree may have become damaged and cannot be repaired.
- An earlier version of Disk First Aid (which cannot repair volumes currently in use as the startup disk) is being used to try to repair the startup volume. Try booting from another volume such as a System Install CD, and run Disk First Aid from the CD.

Message: Disk First Aid Internal Error

Disk First Aid reports an "internal error" during verification or repair of a disk.

Meaning

If Disk First Aid detects a fault with the volume structure that does not conform to what it knows a reliable volume should look like, and it cannot identify it among its list of known issues, Disk First Aid reports the fault as an internal error.

Message: One Item In Trash, Cannot Be Emptied

Sometimes the Trash has one item in it and cannot be emptied.

Meaning

Folders that cannot be thrown away may suggest a directory issue or a Finder flag issue.

Message: "Disk With Bad Name" Error

Disk First Aid reports a "Disk with Bad Name" error. The disk seems fine in every other way.

Meaning

This message may actually indicate other issues with the disk such as bad data in the boot blocks of the hard drive, or possibly a bad pointer.

If an earlier version of Disk First Aid (which cannot repair volumes currently in use as the startup disk) is being used to try to repair the startup volume, try booting from another volume such as a System Install CD, and run Disk First Aid from the CD.

Message: Keys Out of Order

Disk First Aid reports "Keys Out of Order".

Meaning

B-tree records or referenced records have become damaged.

Message: Bad Leaf Node/Index Node

Disk First Aid reports "Bad Leaf Node/Index Node".

Meaning

A node has been changed and no longer correctly refers to other nodes or records.

Message: B-trees Damaged

Disk First Aid reports "B-trees Damaged".

Meaning

The B-tree (part of the disk directory) has become damaged and cannot be repaired by Disk First Aid.

Message: Volume Bitmap Incorrect

Disk First Aid reports "Volume Bitmap Incorrect".

Meaning

The volume bitmap is not accurately reflecting the use of allocation blocks on the drive. Disk First Aid will attempt to repair this, and the extents file, by comparing the two with each other, then comparing against the actual allocation blocks on the drive.

Message: Bundle Bits Need to be Reset

Disk First Aid reports "Bundle Bits Need to be Reset".

Meaning

The Bundle Bit flag needs to be reset for one or more files. (Other Finder flags may also need resetting).

LaserWriter Select: Toner Cartridge Compatiblilty

Is the LaserWriter Select 300/310 toner cartridge compatible with the LaserWriter Select 360 printer?

This article has been archived and is no longer updated by Apple.

The LaserWriter Select 360 is based on a new 600 dpi print engine, and it is not compatible with the original LaserWriter Select 300/310 toner cartridge (M2029G/A). However, a universal LaserWriter Select toner cartridge (M1960G/A) is compatible with the LaserWriter Select 360, LaserWriter Select 310, and LaserWriter Select 300 printers. The universal LaserWriter Select toner cartridge is also compatible with the LaserWriter Select 610, which is only available outside the United States.

RS-232: Marks/Spaces and Cable Length/Grounding

This article discusses RS-232 cable length, grounding , marks and spaces.
This article has been archived and is no longer updated by Apple.

MARKs and SPACEs

All RS-232 signals (except grounds) will be above + 3 volts or below - 3 volts (commonly + or - 12 volts). The area between + 3 volts and - 3 volts is called the transition region.

No RS-232 signal (excluding ground) should ever be stationary at a voltage in the transition region. If one is found between + 3 volts and - 3 volts, it is a definite indication of an issue.

- A high RS-232 voltage (between + 3 volts and + 25 volts) is called a SPACE.
- A low voltage (between - 3 volts and - 25 volts) is called a MARK.
- All Control and Clock signals are SPACEs when ON and MARKs when OFF.
- All Data signals are SPACEs when a logic ZERO and MARKs when a logic ONE.

CABLE LENGTH

One of the issues in an RS-232 installation is determining the length of cable to be used. Because capacitance increases with cable length and increased capacitance can eventually degrade the signal to the point where it will cause the loss of data integrity.

The RS-232 standard very conservatively recommends that the maximum length of cable be 50 feet (unless special low capacitance cable is used) and that its total capacitance be limited to 2500 uf or less. However, this length can usually be doubled, tripled, and more depending on the BPS rate (the higher the BPS rate used, the shorter the cable may have to be).

If a cable is over 50 feet and a length problem is suspected, try using a lower BPS rate. If the problem goes away, then try using a shorter or lower capacitance cable at the higher data rate. If the problem doesn't reappear then it must have been the longer cable.

CABLE GROUNDING

If long cables (over 50 feet) are used, the cable should be shielded. In this case the shield, SG (pin 7), and CG (pin 1) should be grounded to the chassis on only one side of the interface (either the DTE or DCE).

PowerBook: Quitting SCSI Disk Mode

This article describes the proper method for exiting Target Disk Mode or SCSI Disk Mode on a PowerBook computer.
This article has been archived and is no longer updated by Apple.
Follow the steps in the Macintosh User's Guide (for your PowerBook) for connecting and disconnecting SCSI devices to avoid loss of information and damage to your equipment.

When using SCSI Disk Mode, the proper way to quit SCSI Disk Mode is to:

1. Shut Down the computer (host) your PowerBook is connected to.
2. Press the power button on the PowerBook to turn it off.
3. Turn off any other SCSI devices in the chain.
4. Disconnect the PowerBook from the SCSI adapter cable.
5. Disconnect the SCSI cables from the host Macintosh.

Notes:

- If you leave the adapter cable attached to the PowerBook, the computer will behave as though it is still in SCSI disk mode when you try to restart.
- If you unmount the PowerBook's SCSI icon by dragging it to the trash it may lock up the computer and possibly damage the directory information on any mounted hard drive. The damage may only be repaired by reformatting.

Desktop Macintosh: Power, Reset, and Interrupt Buttons

This document describes the location of power, reset, and interrupt buttons on modular Macintosh models made before November 1997. For models made since 1997, see technical document 86225, "**Desktop Macintosh: Power, Reset, and Interrupt Buttons, Part 2**".

To determine the equivalent Performa model to the Macintosh models listed below, see article13998: "**Macintosh to Performa Comparison Chart**".
This article has been archived and is no longer updated by Apple.

General Information: Power Buttons

The power button on modular Macintosh models is typically located on the back of the computer close to the right or left side (depending on the model).

Power buttons come in different shapes and sizes. Some are push buttons (round or square), which may be plain, or may include a sideways triangle or a circle with a small straight line inside. Others are toggles, which include a 1 and a 0 (1=On, 0=Off).

General Information: Reset and Interrupt Buttons

The reset and interrupt buttons are located in different areas on different models. Refer to model-specific descriptions below.

The reset button is marked with a small triangle as shown in Figure 1. Pushing the reset button restarts the computer.

The interrupt button is marked with a circle; if the button is large enough there is a crooked line in the circle, as shown in Figure 1. It is used by software programmers when writing applications and debugging them.

Reset button icon	Interrupt button icon

Figure 1 Reset and Interrupt button icons

Keyboard Commands

If the computer does not have a reset button, press the Command-Control-Power keys instead.

If the computer does not have an interrupt button, press the Command-Power keys instead.

Modular Macintosh Model Specifics

Model	Power Location	Reset/Interrupt Location
Macintosh II, IIx, IIfx	Back panel.	Right side of the computer near the rear. You must install the buttons.
Macintosh IIcx, IIci	Back panel. Rotate 90 degrees to lock power on.	Front panel, lower left.
Macintosh IIsi, LC, LC II, LC III, LC 475, Quadra 605, Performa 400 series	Back panel.	None. Use keyboard commands.
Macintosh LC 550, Macintosh TV, Performa 550 and 560	Back panel.	None. Use keyboard commands.
Macintosh LC and Performa 575, 577, 578, 580	Back panel.	None. Use keyboard commands.
Macintosh 630 family, Performa 6200, 6300, and 6360 series	Back panel.	None. Use keyboard commands.
Macintosh Performa 6400 series	Back panel.	None. Use keyboard commands.
Macintosh IIvx, IIvi, Performa 600, Centris 650, Quadra 650	Back panel.	Front panel, lower left.
Macintosh Centris/Quadra 610	Front panel, lower right side.	Back of computer.
Macintosh Centris/Quadra 660AV	Front panel, lower right side.	None. Use keyboard commands.
Macintosh Quadra 700, 800	Back panel.	Front panel near bottom.

Macintosh Quadra 840AV	Front panel, upper right.	None, use keyboard commands.
Macintosh Quadra 900, 950	None, use key lock.	Front panel, near top left.
Power Macintosh and Performa 5200 and 5300 series	Back panel.	None, use keyboard commands.
Power Macintosh and Performa 6100 series	Front panel, lower right side.	Back of computer or use keyboard commands.
Power Macintosh 7100 series	Back of computer.	Front panel on left side or use keyboard commands.
Power Macintosh 7200, 7500, and 7600 series	Front panel, left side.	Use keyboard commands.
Power Macintosh 8100 series	Back panel.	Front panel near the bottom or use keyboard commands.
Power Macintosh 8500 and 9500 series	Front panel, near top.	Use keyboard commands.

Language Kits: Text Control Panel

The Text control panel does not appear to save its selection. If I change the script setting in the control panel, close it, then open it again, the setting reverts back to Roman/US.
This article has been archived and is no longer updated by Apple.
The Text Control Panel comes with the Japanese Language Kit, Chinese Language Kit, or System 7.5. This control panel is for use with WorldScript II and System extensions. It provides the user with the ability to view the scripts of the various languages (alphabets, writing systems) which are installed in the system.

When opened, the Text Control Panel defaults to show System script. The menu will always be set to the System script when the user opens the control panel because the System script is their primary script (the one they use most often).

Note: Changing the "Script" menu in the Text control panel does not set a script to being the active script; it simply displays the text attributes for that particular script.

When running a language kit, the operating system might still be Roman. If it is, Roman would be the script that is shown in the Text control panel. If the operating system is Kanji, then the Text control panel would show Kanji rather than Roman, even though a Language Kit might be installed in the system.

You hear "breaking glass" or "musical beeps" when you turn on your Mac

You turn on your Mac and you expect to hear that crisp chord Macs are famous for. But instead of the usual startup sound, you hear a noise that sounds like glass breaking or a series of musical beeps. This is your Mac's way of telling you that something's not right.
This article has been archived and is no longer updated by Apple.
First, shut down the computer, then disconnect or remove any non-Apple hardware: memory (RAM), external disk drives, printers, and so forth. See if the computer starts up without these.

"Breaking glass"
The breaking glass sound means there's something wrong with your Mac's hardware, usually related to memory. Remove any third-party RAM if you haven't already. If you only have memory that was installed at the factory, try swapping it with other RAM.

"Musical" beeps

1. Do you hear four or eight beeps? If you heard eight, skip to Solution B.
2. Shut down the computer.
3. Start from a system software CD or DVD (insert the disc, restart, and hold the C key during start up). If you don't hear any beeps now, continue to Solution A. If you still do, skip to Solution B.

   Tip: If you can't start from the disc using the C key, try using Startup Manager.

Solution A

Restart the computer from its hard disk, but press and hold the Shift key during startup until you see a "Safe Boot" (Mac OS X) or "Extensions off" (Mac OS 9 and earlier) message.

Mac OS X: If the computer starts up (Safe Boot) and you don't hear any beeps, you'll need to troubleshoot other startup issues.

Mac OS 9 or earlier: If the computer starts up with extensions off and you don't hear any beeps, an extension conflict is the likely cause. If you still hear the beeps with the extensions off, perform a clean installation.

Solution B

Remove all third-party memory (RAM) that wasn't installed by the factory. If you only have memory that was installed at the factory, try swapping it with other RAM. If you have installed additional memory, remove it.

If you can isolate the issue to a particular memory card, replace it. If necessary, take your computer to an Apple Authorized Service Provider for additional diagnostic tests to determine the exact cause of the issue. There may be a fee for this service.

Where to find support for Apple products

This article has been archived and is no longer updated by Apple.

Learn where various online Apple support offerings are located.

Apple Software Updates

Apple Software Updates is a collection of updaters, utilities, and full software installs to help keep your Apple Products running smoothly. You should read the posted Apple Software License Agreement before downloading any software.

- Featured English-North American and International Apple Software Updates can be downloaded from this web site: http://www.info.apple.com/support/downloads.html
- Software updates for earlier versions of Mac OS and Apple hardware are available by browsing the **Downloads Web site**. You can look at the **Older Software Downloads page** for a list of all software released prior to 1998-01-01.

Knowledge Base

Apple's Knowledge Base contains product information, technical specifications, and troubleshooting information. The Knowledge Base is updated daily and is available from the following URL:

- Search the Knowledge Base for current articles and read the latest technical information: http://search.info.apple.com. To search for information on older Apple products, select the "Archive" checkbox (also labeled "Include content created prior to 1997").

Apple Product-Specific Support
Apple provides support pages at http://www.apple.com/support for current products that include links to:

- Product-specific software updates
- Relevant Knowledge Base articles
- Apple Discussions. The Apple Discussion forums are filled with thousands of Macintosh and iPod users from around the world. Search for an answer, post your question, or answer other users' questions in the Apple Discussions community.

Fee-Based Support Options and Extended Warranty
Apple has a number of programs designed to help you get the most out of your Apple product:

- **AppleCare Protection Plan** is a comprehensive plan that provides three years of service and support for one economical price, and includes telephone support, powerful diagnostic tools, and Apple-certified repairs.
- **AppleCare Professional Video Support** can help you keep your project running smoothly, whether you are editing HD video, designing motion graphics, or authoring custom DVDs.
- **AppleCare Premium Service and Support Plan** provides integrated service and support for Xserve technologies, including Mac OS X Server.

AppleSpec

- Each of the links on the **AppleSpec** web page will take you to an individual AppleSpec Document. Products featured on this page were introduced from November 1997 to the present, and are listed by name and date introduced.

Apple Manuals

- Each of the links on the **Apple Manuals** web page will take you to a Knowledge Base document containing a list of manuals in PDF format. To view or print these documents, use Preview in Mac OS X or install Adobe Acrobat Reader.

Power Macintosh: L1 and L2 Cache Explained

This article differentiates between Level 1 and Level 2 cache on the Power Macintosh computers.
This article has been archived and is no longer updated by Apple.

Level 1 Cache

Level 1 cache consists of high speed memory built into the PowerPC processor. By using this cache, the processor can access frequently-requested data more quickly. The amount of level 1 cache varies among the PowerPC chips, and you cannot upgrade it.

The PowerPC 601 microprocessor and the PowerPC 604 microprocessor both have 32K internal cache. However, the PowerPC 601 microprocessor has a single 32K cache for both instructions and data, whereas the PowerPC 604 has two 16K sections, one for instructions and one for data. The PowerPC 604e microprocessor has 64K cache, which consists of two 32K sections, one each for instructions and data.

Computer	Level 1 Cache
Power Macintosh 4400 series	32K
Power Macintosh 5200/75 & Performa 5200 Series	16K
Power Macintosh 5260/100, 5300/100 & Performa 5300 Series	32K
Power Macintosh 5400 Series	32K
Power Macintosh 5500 Series	32K
Macintosh Performa 6200 Series	16K
Macintosh Performa 6290CD and 6300 Series	32K
Macintosh Performa 6360/160	32K
Power Macintosh & Performa 6400 Series	32K
Power Macintosh 6500 Series	32K
Power Macintosh & Performa 6100 Series	32K
Power Macintosh 7100 Series	32K
Power Macintosh 8100 Series	32K
Power Macintosh 7200 Series	32K
Power Macintosh 7300 Series	64K
Power Macintosh 7500/100	32K
Power Macintosh 7600/120 and /132	32K
Power Macintosh 7600/200	64K
Power Macintosh 8500/120	32K
Power Macintosh 8500/132	32K
Power Macintosh 8500/150	32K
Power Macintosh 8500/180	64K
Power Macintosh 8600/200	64K
Power Macintosh 9500/120	32K
Power Macintosh 9500/132	32K
Power Macintosh 9500/150	32K
Power Macintosh 9500/180MP	64K
Power Macintosh 9500/200	64K
Power Macintosh 9600/200	64K
Power Macintosh 9600/200MP	64K
Power Macintosh G3	32K
Power Macintosh G3 (Blue and White)	64K
Power Mac G4 (PCI Graphics)	64K
Power Mac G4 (AGP Graphics)	64K

Level 2 Cache

Level 2 cache (L2 cache) is separate from the processor and in older computers it was upgradeable. The L2 cache works in conjunction with the microprocessor's internal cache to provide maximum performance. The total amount of supported L2 cache also varies from computer.

Performance Benefits

* Native PowerPC Software
You see the greatest performance improvement in tightly written native PowerPC software where code is kept close to the microprocessor.

* Non-Native Software

You will likely see marginal or no performance improvements running software applications written for 68000-series microprocessors.

PowerPC Microprocessors

The reason for performance increases with the addition of L2 cache is the PowerPC microprocessor can keep its pipeline full, allowing for faster and more efficient processing. The microprocessor first checks its internal cache, then L2 cache, and finally main memory (DRAM) for instructions. Because cache memory is faster than DRAM, it can be accessed more quickly, thus helping keep the pipeline full.

This also accounts for the lack of uniform performance improvements. Tight code will stay near the processor and run faster, while other code may not. In general, you can expect a 10-15% performance improvement with code that benefits from L2 cache.

Power Macintosh Models

The NuBus-based Power Macintosh computers (the 6100, 7100, and 8100 series) and the PCI-based Power Macintosh computers do not use the same type of L2 cache.

Power Macintosh 6100, 7100, and 8100

The 6100, 7100 and 8100 Power Macintosh models accept an external L2 cache on a Single Inline Memory Module (SIMM). The Power Macintosh 8100/80 shipped with 256K L2 cache already installed; users of Power Macintosh 6100/60, 6100/60AV, 7100/66, and 7100/66AV can install a L2 cache by installing the appropriate cache SIMM into the 160-pin connector on the main logic board.

The Power Macintosh 6100/66, 7100/80, 8100/100, and 8100/110 computers ship with 256K L2 cache installed.

Power Macintosh 7200, 7300, 7500, 7600, 8500, 8600, 9500, and 9600

The Power Macintosh 7200, 7300, 7500, 7600, 8500, and 8600 series all support L2 cache 160-pin Dual Inline Memory Modules (DIMMs). The cache can be increased by adding L2 cache DIMMs to the expansion slot(s) on the logic board.

The Power Macintosh 7200/75, 7200/90, 7200/120 (8 MB configuration), and the 7500 series computers ship with no L2 cache DIMM installed.

The Power Macintosh 7200/120 (16 MB configurations), 7300 series, 7600 series, 8500 series, and the 8600 series include a 256K L2 cache DIMM installed. The Power Macintosh 7200 is theoretically expandable to 1 MB, while the 7300, 7500, 7600, 8500, and 8600 series computers are theoretically expandable to 4 MB, but those configurations have not been tested and are not supported by Apple.

The Power Macintosh 9500 and 9600 series computers ship with 512K L2 cache memory soldered to the logic board. The Power Macintosh 9500 and 9600 series computers do not have a DIMM socket for adding additional L2 cache memory, and therefore are not expandable beyond 512K.

Power Macintosh G3 and later computers have L2 cache built into the processor module and are not upgradeable.

Computer	L2 Cache	Cache Type	Supported Sizes	Max Total Cache
4400	256K	160-pin DIMM	256K	256K
5200	256K	On logic board	N/A	256K
5260	OPTIONAL	160-pin DIMM	256K	256K
5300	256K	On logic board	N/A	256K
5400	OPTIONAL	160-pin DIMM	256K	256K
5500/225	256K	160-pin DIMM	256K	256K
6200	256K	On logic board	N/A	256K
6300	256K	On logic board		256K
6360	OPTIONAL	160-pin DIMM	256K	256K
6400/180	NONE	160-pin DIMM	256K	256K
6400/200	256K	160-pin DIMM	256K	256K
6500/225	256K	160-pin DIMM	256K	256K
6500/250	256K	160-pin DIMM	256K	256K
6100/60	OPTIONAL	160-pin SIMM	128K, 256K	256K
6100/66	256K	160-pin SIMM	128K, 256K	256K
7100/66	OPTIONAL	160-pin SIMM	128K, 256K	256K
7100/80	256K	160-pin SIMM	128K, 256K	256K
8100	256K	160-pin SIMM	128K, 256K	256K
7200/75	NONE	160-pin DIMM	256K (1)	256K
7200/120	256K DIMM	160-pin DIMM	256K (1)	256K
7300 Series	256K DIMM	160-pin DIMM	256K,512K,1 MB	1 MB(2)
7500/100	NONE	160-pin DIMM	256K,512K,1 MB	1 MB(2)

7600 Series	256K DIMM	160-pin DIMM	256K,512K,1 MB	1 MB(2)
8500 Series	256K DIMM	160-pin DIMM	256K,512K,1 MB	1 MB(2)
8600 Series	256K DIMM	160-pin DIMM	256K,512K,1 MB	1 MB(2)
9500 Series	512K	On logic board	N/A	512k
9600 Series	512K	On logic board	N/A	512k
G3 (3)	1 MB	On Processor	N/A	1 MB
G3 Blue & White	512K or 1MB (4)	On Processor	N/A	512K or 1MB (4)
Power Mac G4	1 MB	On Processor	N/A	1 MB
Power Mac G4 (Gigabit Enet)	1 MB	On Processor	N/A	2 MB (5)
Power Mac (Digital Audio)	1 MB (6)	On Processor	N/A	1 MB (6)
Power Mac G4 Cube	1 MB	On Processor	N/A	1 MB
iMac 233 MHz	512K	On Processor	N/A	512K
iMac 266 MHz	512K	On Processor	N/A	512K
iMac 333 MHz	512K	On Processor	N/A	512K
iMac (Slot Loading)	512K	On Processor	N/A	512K
iMac (Summer 2000)	512K	On Processor	N/A	512K
iMac (Early 2001)	256K (7)	On Processor	N/A	256K (7)
iMac (Summer 2001)	256K (7)	On Processor	N/A	256K (7)
iMac (Flat Panel)	256K (7)	On Processor	N/A	256K (7)
iMac (17-inch Flat Panel)	256K (7)	On Processor	N/A	256K (7)
iMac (17-inch 1GHz)	256K (7)	On Processor	N/A	256K (7)
iMac (USB 2.0)	256K (7)	On Processor	N/A	256K (7)
iMac G5	512K (7)	On Processor	N/A	512K (7)
Mac mini	512K	On Processor	N/A	512K (7)

Notes:

The parenthetical product descriptions (Summer 2000) and (Summer 2001) refer to the summer of the Northern Hemisphere.

Apple does not sell cache modules larger than 256K.

Apple does not support cache modules larger than 256K.

1. These computers theoretically support 512K and 1 MB of L2 cache, but these configurations have not been tested and are not supported by Apple.

2. These computers support a theoretical limit of 4 MB of L2 cache, but this has not been tested and is not supported by Apple.

3. G3 computers running at 233 MHz and 266 MHz have 512k L2 cache.
The Power Macintosh 7200/120 configuration with 8 MB of memory does NOT include the L2 Cache DIMM.

4. Power Macintosh G3 (Blue and White): 512K or 1MB backside level 2 cache on processor, running at 150, 175, or 200 MHz depending on processor speed. The backside L2 cache is integrated into the design of the G3 microprocessor module. No cache expansion is possible without replacing the entire module.

5. Power Mac G4 (Gigabit Ethernet) has dual processors on 450 and 500 MHz models. Each processor has 1 MB L2 cache.

6. Power Mac G4 (Digital Audio) 466 and 533 MHz models have 1 MB Level 2 cache. 667 and 733 MHz models have 256K Level 2 cache on the processor and support up to 2 MB Level 3 cache.

7. The built-in L2 cache runs at the same clock speed as the microprocessor, clock speed ratio 1:1. Previous iMac models have a clock speed ratio of 5:2.

Macintosh and LaserWriter: SCSI Termination Outlined

Is there a table that outlines the specific termination requirements and capabilities of the Macintosh and Apple printer product lines?
This article has been archived and is no longer updated by Apple.
Below is a table that includes the SCSI termination specifics for all Macintosh models and LaserWriter printers (current as of this issue) and describes whether termination power (TPWR) is supplied for either the internal or external SCSI bus, depending on which is present (one or both).

Macintosh Models
Here is a description of the information provided in each column of the following table:

Additional Termination - Indicates if additional termination is needed for a separate internal bus.
Internal Device - Indicates if an internal device or BUS TPWR is supplied.
External Bus - Indicates if an external BUS TPWR is supplied.
Term. Type - Indicates the type of terminator required for the external bus.
SCSI Mode - Indicates if the CPU can be used in SCSI disk mode. Currently only some PowerBook models support SCSI Disk Mode.

NOTE: The asterisks in the table correspond to footnotes that follow the table.

CPU Name	Additional Termination	Internal Device	External Bus	Term. Type	SCSI Mode
Macintosh Plus	No	No	No	Gray	No
Macintosh SE	No	Yes	Yes	Gray	No
Macintosh SE/30	No	Yes	Yes	Gray	No
Macintosh Classic	No	Yes	Yes	Gray	No
Macintosh Classic II	No	Yes	Yes	Gray	No
Macintosh Color Classic	No	Yes	Yes	Gray	No
Macintosh II	No	Yes	Yes	Gray	No
Macintosh IIx	No	Yes	Yes	Gray	No
Macintosh IIcx	No	Yes	Yes	Gray	No
Macintosh IIci	No	Yes	Yes	Gray	No
Macintosh IIfx	No	Yes	Yes	Black	No
Macintosh IIvx	Automatic*	Yes	Yes	Gray	No
Macintosh IIvi	Automatic*	Yes	Yes	Gray	No

CPU Name	Additional Termination	Internal Device	External Bus	Term. Type	SCSI Mode
Macintosh LC	No	Yes	Yes	Gray	No
Macintosh LC II	No	Yes	Yes	Gray	No
Macintosh LC III	No	Yes	Yes	Gray	No
Macintosh LC 520	Intrnl hd	Yes	Yes	Gray	No
Quadra 605	No	Yes	Yes	Gray	No
Quadra 610	On last device	Yes	Yes	Gray	No
Macintosh 630 Family	Intrnl hd	Yes	Yes	Gray	No
Quadra 650	Intrnl hd	Yes	Yes	Gray	No
Quadra 700	Intrnl hd	Yes	Yes	Gray	No
Quadra 800	On last device	Yes	Yes	Gray	No
Quadra 900	On cable	Yes	Yes	Gray	No
Quadra 950	On cable	Yes	Yes	Gray	No

CPU Name	Additional Termination	Internal Device	External Bus	Term. Type	SCSI Mode
Performa 200	No	Yes	Yes	Gray	No

Performa 400	No	Yes	Yes	Gray	No
Performa 405	No	Yes	Yes	Gray	No
Performa 410	No	Yes	Yes	Gray	No
Performa 430	No	Yes	Yes	Gray	No
Performa 450	No	Yes	Yes	Gray	No
Performa 460	No	Yes	Yes	Gray	No
Performa 466	No	Yes	Yes	Gray	No
Performa 467	No	Yes	Yes	Gray	No
Performa 475	No	Yes	Yes	Gray	No
Performa 476	No	Yes	Yes	Gray	No
Performa 550	Intrnl hd	Yes	Yes	Gray	No
Performa 600	Automatic*	Yes	Yes	Gray	No

CPU Name	Additional Termination	Internal Device	External Bus	Term. Type	SCSI Mode
Macintosh Portable	No	No	No	Gray	No
PowerBook 100	No	Yes	No	Gray	Yes
PowerBook 140	No	Yes	No	Gray	No
PowerBook 145	No	Yes	No	Gray	No
PowerBook 145b	No	Yes	No	Gray	No
PowerBook 150	No	No	No	Gray	No
PowerBook 160	No	Yes	No	Gray	Yes
PowerBook 165c	No	Yes	No	Gray	Yes
PowerBook 170	No	Yes	No	Gray	No
PowerBook 180	No	Yes	No	Gray	Yes
PowerBook 180c	No	Yes	Yes	Gray	Yes
PowerBook Duo 210	No	Yes	No	Gray	Yes**
PowerBook Duo 230	No	Yes	No	Gray	Yes**
PowerBook Duo 250	No	Yes	No	Gray	Yes**
PowerBook Duo 270c	No	Yes	No	Gray	Yes**
PowerBook 520/520c	No	No	No	Gray	Yes
PowerBook 540/540c	No	No	No	Gray	Yes
PowerBook 540/540c	No	Yes	Yes	Gray	No

CPU Name	Additional Termination	Internal Device	External Bus	Term. Type	SCSI Mode
Power Macintosh 6100!	Last device	Yes	Yes	Gray	No
Power Macintosh 7100!	Intrnl hd	Yes	Yes	Gray	No
Power Macintosh 8100!	Last device	Yes	Yes	Gray	No
! Power Macintosh information is valid for all speeds of the particular Power Macintosh model.					

Apple Workgroup Server	Additional Termination	Internal Device	External Bus	Term. Type	SCSI Mode
AWS 60	Intrnl hd	Yes	Yes	Gray	No
AWS 80	Intrnl hd	Yes	Yes	Gray	No
AWS 95	Intrnl hd	Yes	Yes	Gray	No

NOTES:
* An active termination circuit automatically terminates the internal device when it is the last device on the bus. If a terminated device is attached to

the external SCSI port, the internal termination is deactivated.

** These PowerBook Duos work in SCSI Disk Mode with a minidock.

Printer Information

Here is a description of the information provided in each column of the following table:

Direct Connect - Indicates if the printer includes a direct SCSI connection.
External Port - Indicates if the printer includes an external SCSI port (for additional font storage).
Term. Type - Indicates the type of terminator required for the external port.
TPWR - Indicates if termination power is supplied and, if so, if it is internal or external.
Reserved SCSI IDs - Indicates if the printer includes a reserved SCSI ID and, if so, what ID number is reserved.

NOTE: The asterisks in the table correspond to footnotes that follow the table.

Printer Name	Direct Connect	External Port	Term. Type	TPWR	Reserved SCSI IDs
LaserWriter	No	No	n/a	n/a	n/a
LaserWriter Plus	No	No	n/a	n/a	n/a
LaserWriter IISC	Yes	Yes	Grey	No	7
LaserWriter IINT	No	No	n/a	n/a	n/a
LaserWriter IINTX	No	Yes	Grey	No	7
LaserWriter IINTXJ	No	Yes	Grey	No	7
LaserWriter IIf	No	Yes	Black	No	6
LaserWriter IIg	No	Yes	Black	No	6
LaserWriter Pro 600	No	No	n/a	n/a	n/a
LaserWriter Pro 630	No	Yes	Black	Int-Yes Ext-No	6&7
LaserWriter Pro 810	No	Yes	Gray	Yes	7
LaserWriter Select 300	No	No	n/a	n/a	n/a
LaserWriter Select 310	No	No	n/a	n/a	n/a
LaserWriter Select 360	No	No	n/a	n/a	n/a
Personal LaserWriter SC	Yes	Yes	Gray	No	7
Personal LaserWriter LS	No	No	n/a	n/a	n/a
Personal LaserWriter NT	No	No	n/a	n/a	n/a
Personal LaserWriter NTR	No	No	n/a	n/a	n/a
Personal LaserWriter 300	No	No	n/a	n/a	n/a
Personal LaserWriter 320	No	No	n/a	n/a	n/a
Apple Color Printer	Yes	No	***	No	***
StyleWriter	No	No	n/a	n/a	n/a
StyleWriter II	No	No	n/a	n/a	n/a
Color StyleWriter Pro	No	No	n/a	n/a	

NOTES:
*** The Macintosh model determines which terminator to use.

JLK 1.0: Overseas Power Macintosh Compatibility

This article describes an issue with the Japan Power Macintosh and Japanese/Chinese Language Kit (version 1.0) installer. This does not affect U.S. Power Macintosh computers running version 1.0 of the Japanese/Chinese Language Kits. The Power Macintosh and the Japanese/Chinese Language kits version 1.0 are compatible in the U.S.
This article has been archived and is no longer updated by Apple.
Version 1.0 of the Japanese Language Kit installer will replace the NuScript manager with an older version. Version 1.1 of JLK/CLK is available internationally to fix this problem. This issue does not affect the systems used in the United States in any way.

The following article can help you locate the software update mentioned here:

Power Macintosh: Run Time Environment

This article provides a technical description of the Run Time Environment and the switch from the 680x0 segment loader to the new Code Fragment Manager.
This article has been archived and is no longer updated by Apple.
A run-time environment is a set of conventions that determine how code and data are loaded into memory and managed. The PowerPC run-time environment is significantly different from the one provided in 680x0-based Macintosh System Software. Fortunately, this change is for the better. The most significant change is the use of fragments to organize code and data in memory. Fragments can be an application, import library (such as system software), or extension. Fragments provide the following benefits:

- Fragments let software in import libraries be easily shared with other programs.
- Fragments provide a simplified means for all software components to address global data. With 680x0 systems, it was provided only for applications.
- The use of fragments is one of the elements that allow future modernization of the Macintosh operating system. It lets new system features such as a microkernal be easily implemented.

Fragments

A fragment is a method of organizing code and data. Fragments can loosely be categorized into three areas:

- An Application is a fragment launched by the user.
- Extensions are fragments which extend the capabilities of other fragments.
- Import library -- These fragments can be shared with other fragments. System software is an example of this type of fragment. Since this fragment can be shared, an import library is also referred to as a shared library. In addition, since import libraries are linked dynamically at application launch time (that is, not when the application was created or installed), they are also referred to as dynamically linked libraries.

At application launch time, the Code Fragment Manager makes sure all the necessary fragments are loaded to memory and prepared for execution. This manager uses the Code Fragment Loader to perform the loading into memory.

Fragment Storage

The physical storage for a fragment is called a container. A container can be any logically contiguous memory location such as a data fork of a file, Macintosh ROM, or a resource.

PowerPC executable code is stored in the data fork of the application file. A 'cfrg'0, is added to the resource fork to indicate that this application is a PowerPC application. In contrast, 680x0 applications place executable code as 'CODE' resources in the resource fork

This arrangement of code and resources allows the creation of a single application that can run on both 680x0- and PowerPC-based Macintosh computers. By combining the two structures together, you get what is called a fat application.

Fat Applications

If a fat application is executed on a 680x0-based Macintosh computer, the system software ignores the 'cfrg'0 resource because it is an unknown type and loads just the 680x0 'CODE' resources. If executed on a Power Macintosh, the system software recognizes the 'cfrg'0 resource and loads the PowerPC code from the data fork.

A fat application is very useful when supporting mixed 680x0 and PowerPC environments. However, it may not be desirable to have a fat application. For example, there may be cases where the 680x0 performance is insufficient to run the application. In this instance, a 'CODE' resource should be installed so when the PowerPC-only application is run on a 680x0 system, a dialog box shows up to explain the situation.

A developer can distribute a single fat application. With Installer 4.0, the user has the option of installing only PowerPC or 680x0 executable application or both.

Import Library

An import library (shared library or dynamically linked library) makes applications be smaller. Since import code is loaded dynamically at application launch time, this code does not have to be part of the application. If only one application utilizes this library, there is little advantage unless the import library is stored in ROM (like system software).

The big advantage of an import library is when multiple applications utilize the same import library since a library is loaded into memory only once. Thus, several applications can have access to the library, without each having to have the RAM overhead to support the functionality.

In addition, centralizing functionality lets updates be made easily. By changing only one set of code, many applications are updated simultaneously.

An import library can be created for such sharable functions such as a spell checker. In addition, it can be used to support infrequently used application functions. The Code Fragment Manager can load these functions on demand after application launch. This results in smaller RAM usage and quicker launching.

Memory Organization

The organization of memory in the PowerPC run-time environment is reasonably similar to the 680x0 environment. The system partition occupies the lower memory addresses while applications take the remaining space starting at the higher memory addresses. As with the 680x0 application partition, the Process Manager allocates space for a stack, heap, and global variable space.

The main difference between the PowerPC and 680x0 memory organization is the location of an application's code section and global variables. This difference varies depending on whether the Power Macintosh has virtual memory turned on or not.

In 680x0 environment, virtual memory uses a single monolithic file on a single volume as backing store. This backing store is mapped to a virtual memory address space. Its size is set via the Memory Control Panel. Unused pages of memory are written to this backing store and loaded into main memory as needed.

This backing store is necessary because the Resource Manager is not re-entrant. Since 68K code is found in code resources in the resource fork of an application, it is accessed by the Resource Manager. However, since it is not re-entrant, the manager cannot be accessed at an interrupt level. Therefore when a page fault occurs, the code must be written to the system wide backing file because it cannot be retrieved from its original location.

A backing store sometimes prolongs the launch of an application. This occurs when an application's code is loaded into main memory only to be immediately written out to the backing store file.

This virtual memory delay is eliminated by the use of a scheme called file mapping. The Virtual Memory Manager uses the data fork of the application as the paging file. The entire code fragment is mapped to logical address space. Assuming the application code does not change (this is a guideline), it can be presumed to be read-only. As such, only the needed portions of code are actually loaded into physical memory.

Note: This file mapping only applies to native applications. These applications have code stored in the data fork.

As a result of this file paging scheme, native applications have a special note attached to their Get Info boxes. At the bottom of Get Info window, there is a message indicating that if virtual memory is turned on, the application's RAM requirements change.

The same application's memory requirement changes when Virtual Memory is turned on (which is indicated in the note). This change in memory requirements is made automatically by the system.

If virtual memory is not turned on, code is loaded into the application heap. The Finder and Process Manager will automatically expand the memory as necessary. This is similar to the 680x0 run-time environment.

Macintosh Displays: Overview of Sense Codes and Adapters

This article describes sense codes and sense adapters and why they are used. Additional information can be found in article 15987: "**Macintosh Monitor Sense Codes: Technical Description**".
This article has been archived and is no longer updated by Apple.
Apple computers and video cards rely on sense codes in the display's video cable to determine what resolution at which to run. For example, an Apple 13-inch RGB monitor tells the Macintosh that it supports 640 x 480, so the Macintosh computer responds by displaying that resolution. When an Apple Multiple Scan Display is connected, it signals to the Macintosh that it can run in a range of resolutions. For example, a Multiple Scan 20 Display can support resolutions from 640 x 480 up to 1152 x 870. Sense Code technology is how Apple displays know what resolution to display.

Older Macintosh computers and Apple video cards do not have reprogrammable video drivers that allow them to switch to higher resolutions. If a Multiple Scan Display is connected to an older Macintosh or video card, it will be limited to 640 x 480 resolution.

Macintosh computers and video cards that fall into this class are:

- Video Cards - 4*8, 8*24, and 8*24GC
- LC , LC II, LC III (except 475, 476, and 630)
- Performa (except the 475, 476, and 630 family)
- PowerBook
- Duo Dock and MiniDock*
- Macintosh II family

The sense adapter attaches to the display's video cable, and has a sense code for a higher resolution.

* - The Duo Dock does not require a video adapter to change resolutions when System 7.5 is installed.

Sense Adapters

Sense code cable adapters allow older Macintosh and video cards to display higher resolutions on multiple scan displays. The adapters have a sense code for a higher resolution. This tricks the Macintosh into thinking it is hooked to a fixed frequency display like our 16-inch and 21-inch RGB displays.

The other solution, when using a multiple scan display, is to use a programmable display card like a Macintosh Display Card 24AC. Because this card is fully capable of recognizing the multiple scan sense codes and changing resolutions without restarting, even older Macintosh Systems work fine if they have a 24AC card.

Apple Displays: Model Numbers

This article lists model numbers that appear on the information tag on the back of Apple displays.
This article has been archived and is no longer updated by Apple.
Many times the only information people have is the model number. This chart can be used to determine the monitor they have from the model number.

Number on Monitor	Monitor Name
M0400	Apple High-Resolution Monochrome Monitor
M0401	AppleColor High-Resolution RGB Monitor (13-in Rev A)
M0402	Apple Two-Page Monochrome Monitor (Rev A)
M0404	Macintosh Portrait Display (Rev A)
M1025	Apple Two-Page Monochrome Monitor (Rev B)
M1030	Macintosh Portrait Display (Rev B)
M1050	Macintosh 12-in Monochrome Display
M1212	Macintosh Color Display
M1296	Macintosh 12-in RGB Display
M1297	AppleColor High-Resolution RGB Monitor (13-in Rev B)
M1298	Macintosh 16-in Color Display
M1787 or M2346	Apple Color Plus 14-in Display
M1823	Apple Multiple Scan 20 Display (Rev A and Rev B) (Note 1)
M2001	AudioVision 14 Display
M2494	Apple Multiple Scan 17 Display
M2935	AppleVision 1710 Display
M2935	Colorsync 17-inch Display (formerly named the AppleVision 750 Display)
M2942	AppleVision 1710 AV Display
M2942	AppleVision 750 AV Display
M2943	Apple Multiple Scan 15 Display
M3502	Macintosh 21-in Color Display
M3703	ColorSync 20-inch Display (formerly named the AppleVision 850 Display)
M3705	AppleVision 850 AV Display
M4222	Multiple Scan 14" Display
M4436	Multiple Scan 1705 Display
M4552	Multiple Scan 720 Display
M4681	Multiple Scan 15 AV
M6204	Apple Studio Display with ColorSync (21-inch, Blue and White)
M6221	Apple Studio Display (17-inch, Blue and White)
M4551(A)	Apple Studio Display (LCD 15-inch, original model)
M4551(B)	Apple Studio Display (LCD 15-inch, Blue and White)
M9103	Apple Basic Color Display
M7613	Apple Studio Display (LCD 15-inch DVI)
M2454	Apple Studio Display (LCD 15-inch ADC)
M5662	Apple Cinema Display (DVI)
M8149	Apple Cinema Display (ADC)
M8536	Apple Cinema HD Display
M7649	Apple Studio Display 17 (LCD)
A1038	Apple Cinema Display (20-inch)

Note:

TA21608_Apple_Displays_Model_Numbers_(TIL15087).pdf

1. The Apple Multiple Scan 20 Display Rev. A and Rev. B have the same overall appearance. To distinguish the two versions, check the last three digits of the serial number. The serial number for the Rev.B version ends in one of the following:
- 5B4
- 5J2
- 5JE
- 5JF

The Apple Trackpad: Overview of Technology and Use

This article describes the Apple Trackpad technology.
This article has been archived and is no longer updated by Apple.

Key Points

- A conductive surface (such as a finger) is needed to move the cursor. Pointing devices such as pens, a Newton stylus or even a finger nail won't work. Humidity can also impair contact.
- There is a direct correspondence between the rectangular trackpad and rectangular screen.
- Solid state mechanism allows space to be allocated to larger, longer lasting batteries.
- More reliable than a mouse or a trackball.
- Provides clicking and dragging capability on some PowerBook models.

Description

The Apple trackpad is a pointing device that provides precise control over cursor movement. Based on user testing and feedback, Apple engineers have tuned the interface to make the trackpad a very efficient pointing device for interacting with the computer.

More recent PowerBook models provide the ability to use the trackpad to select and drag icons or text blocks rather than having to use the trackpad button. Check the Trackpad control panel, shown in Figure 1, to see if clicking and dragging are supported on your particular PowerBook model.

Figure 1 Trackpad Control Panel

Technology Overview

The technology works on a principal called coupling capacitance. As your finger moves over the surface, the trackpad evaluates the change in capacitance between two layers of measurement electrodes built into the surface of the trackpad. The electrodes are arranged in a checkerboard configuration, which creates a series of intersections, or couplings, where the capacitance is measured by the trackpad. The horizontal electrodes send out a test pattern signal which the vertical electrodes sense. As a finger approaches the trackpad surface, its presence lowers the capacitance (coupling coefficient) at the closest electrode intersections and modifies the signal received by the sense electrodes.

By monitoring this change in capacitance, the trackpad is able to first locate and then compare the current location of low capacitance (where the finger is touching) to the previous location, and then moves the cursor accordingly. This cycle of sending out a test pattern, sensing the change in capacitance, and moving the cursor is constantly repeated. The high resolution of the trackpad (387 dots per inch in the horizontal and vertical directions) allows precise control over cursor movement down to the pixel level. The Trackpad control panel provides a adjustments over a full range of acceleration to ensure precise control.

Trackpad Speed Adjustments

The faster your finger moves across the pad, the faster and farther the cursor will move across the display. If the finger moves quickly, the cursor will traverse the display completely. If the finger moves slowly, the cursor can be controlled quite precisely. In fact, just rocking the finger tip slightly on the pad gives pixel level accuracy! New trackpad users can experiment with the control settings in the Trackpad control panel to see which acceleration setting works best.

The acceleration curve settings offered range from slow to fast. The higher the curve chosen, the farther the user will be able to traverse the screen with a shorter finger movement on the pad. The setting that is most preferred among users is the fourth setting up from the slowest setting.

Apple Monitors: How To Change Resolution

This article explains how to change screen resolutions on Apple monitors when running Mac OS version 8 or later.
This article has been archived and is no longer updated by Apple.
You can change the resolution of your monitor to zoom in for detail work or to zoom out and see a whole page or more at a time. To change your screen resolution, follow these steps:

1. Select the Monitors control panel from the Apple menu, it may also be called Monitors and Sound.

Note: If you have more that one monitor, a separate Monitors control panel will appear on each display.

2. Click on the resolution you desire in the Resolution section of the control panel.
3. The new resolution will be displayed after you select it.
4. Close the Monitors control panel by clicking the close box in the upper-left corner.
5. If the image is distorted, adjust the video controls in the Monitors control panel or on the monitor itself.

AppleShare and AppleShare IP File Sharing: Chart of All Limitations

This article provides an overview of the limits for AppleShare File Server and Personal File Sharing.

Note: This document does not apply to any version of Mac OS X or Mac OS X Server. This document describes older AppleShare and AppleShare IP products, as well as Personal File Sharing in Mac OS 9 or earlier. For Mac OS X Server, see documents 107684 and 107323. This article has been archived and is no longer updated by Apple.

AppleShare File Server and Sharing Limitations							
	Pro	**IP 5.x & 6.x**	**4.2 & 4.2.1**	**4.0.2 & 4.1**	**3.0.x**	**2.0.1**	**File Sharing (6)**
Maximum # of Connected Users	200	250/500 (6)	250	150	120	50	10
Maximum # of Outstanding Requests	50	-	64	30	15	n/a	5
Maximum # of Open Files	5000	3000(2,9)	3000(2)	346	346	160	346
Maximum # of Volumes	50	50	50	50	50	16	10
Maximum # of Shared Items	50	100	100	50	50	n/a	10
Maximum # of Users in User and Groups(3)	8192	4096	8192	8192	8192	2000	100
Maximum # of Group Membership/User	42	42	42	42	42	16	41
Maximum # of Simultaneous File Launches	200	250(1)	150(1)	150(1)	120	app specific	10
Maximum # of Files per Volume	65,536	65,536 (8)	65,536	65,536	65,536	65,536	65,536
Maximum Volume Size	2 GB	2 TB (4,5)	4 GB	4 GB	4 GB	2 GB	2 TB (4,7)
Maximum File Size	2 GB	2 GB	2 GB	2 GB	2 GB	2 GB	2 GB

.

Table Notes

1. Depends on application and connected users.
2. 3000 instances of 346 unique open files.
3. 2000 recommended.
4. Mac OS versions prior to System 7.5 support a maximum volume size of 2 GB. System 7.5 and later support volume sizes in excess of 4 GB. However, because AppleTalk Filing Protocol (AFP) version 2.0 is limited to volume sizes of 4 GB or less, the maximum AppleShare volume size remains 4 GB. (see note below)
5. AFP 2.2 adds support for 2 terabyte volumes. Using AppleShare Client 3.7.2 or newer with AppleShare IP 5.0.2 or newer allows the use of these larger volume sizes.
6. Maximum number of connected users is subject to licensing restrictions. The maximum limit of 500 users is only available in ASIP 6.x and may require additional memory. For details, see article 24624:" **AppleShare IP 6: Read Me**"
7. Clients will see all the items on the server but the free space reported will never exceed 1.9 GB.
8. ASIP 5.x and 6.x utilize AFP 2.2, which allows for over 4 billion (2^32) shared files on a volume. In practice, the maximum number of shared files will be the same as the maximum number of files that can be stored on the volume. For HFS volumes, this is 65,536 files. For HFS+ volumes this limit will be significantly higher.
9. The limit of 346 unique open files is a limitation of Mac OS versions prior to Mac OS 9. Mac OS 9 and later support up to 8169 unique open files. AppleShare IP 6.3 and later, when used with Mac OS 9 and later, can support up to 3000 open files, all of which may be unique (depending on file usage by other parts of the system).

See Article 24601: "**Mac OS Extended Format: Volume and File Limits**"

NOTE: With AppleShare Workstation (client) software older than version 3.5, the maximum volume size is a few hundred kilobytes less that 2 GB. This was fixed with version 3.5.

For limitations on Apple File Services in Mac OS X Server, see the following article:

LaserWriter Pro 630: Adjusting Print Density

The Users Guide for my LaserWriter Pro 630 states that I can change the print density via the LaserWriter Utility. When I attempt to change the density, I see no noticeable change in the density. Am I missing something?

This article has been archived and is no longer updated by Apple.

The LaserWriter Utility allows you to make changes to the print density. However, the change in density is minimal and may not be visible under normal circumstances.

3400 Notes:
1) The computer does not provide a display with 2 bits per pixel.

2) An SVGA monitor's display resolution will be 640 by 480 pixels. The user can switch to a higher resolution by using the Monitors control panel or the control strip. The resolution set by the user will be used the next time the computer is started up.

3) If the external monitor can display 800 by 600 pixels at 60 Hz, the PowerBook 3400 computer can display simultaneously on both the external monitor and the flat panel display. This mode of display, called Simulscan, provides the same information on both displays.

Display Cards

Display Card	Performa	Performa Plus	13/14-in Displays	Multiple Scan @ 640x480
Macintosh II	N/A	N/A	16 C	N/A
2-Page Mono Card	N/A	N/A	N/A	N/A

Display Card 24 AC	16.7M C	16.7M C	16.7M C	16.7M C

C = Number of Colors

(1) Can be upgraded with eight (8) Mac II Video Expansion RAM chips for 256 grays/colors.

(2) The 4*8 can be upgraded to a 8*24 by adding two (2) VRAM SIMMs.

Note: Display adapters are available from several third-party companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

G3 systems	See article 30250, titled "**Power Macintosh G3 & G3 All-in-one: Video RAM Upgrade**"				

C = Number of Colors
G = Number of Grays
* = HDI-45 port makes use of 640K of internal DRAM memory.

(1) For the Power Macintosh AV computers, pixel and viewable color numbers are for computer graphics only. When video is enabled, VRAM is split evenly between graphics and video.

(2) This is a built-in 15-in display.

(3) 16-bit only supported at 1024 x 768.

(4) 16" supported at 832 x 624 only.

PowerBook Family

PowerBook	VRAM	16-in Color Multi-Scan 15, 17, 20 (832 x 624)	Portrait Display	21-in Monochrome	Multi-Scan 17 and 20 (1024 x 768)
160, 165, 165c 180, 180c	--	256 C (1)	256 G	N/A	N/A
190 Series	--	256 C	256 G	N/A	N/A
500 Series	--	256 C	256 G	N/A	N/A
5300 Series	--	256 C	256 G	N/A	N/A
1400 Series	--	256 C	256 G	N/A	N/A
3400 Series	--	256 C	N/A	N/A	256 C
G3	--	16.7M C	N/A	N/A	32,768 C
Duo Dock	512K 1MB	256 C 32,768 C (2)	256 G 256 G	N/A N/A	N/A N/A
MiniDock	512K	256 C	16 G	N/A	N/A
Duo Dock II	--	32,768 C	256 G	256 G	256 C

C = Number of Colors
G = Number of Grays

(1) Requires display adapter to use Multiple Scan Displays at this resolution.

(2) The Duo Dock requires a video adapter to change resolutions unless System 7.5 is installed.

3400 Notes:
1) The computer does not provide a display with 2 bits per pixel.

2) An SVGA monitor's display resolution will be 640 by 480 pixels. The user can switch to a higher resolution by using the Monitors control panel or the control strip. The resolution set by the user will be used the next time the computer is started up.

3) If the external monitor can display 800 by 600 pixels at 60 Hz, the PowerBook 3400 computer can display simultaneously on both the external monitor and the flat panel display. This mode of display, called Simulscan, provides the same information on both displays.

Display Cards

Display Card	16-in Color Multi-Scan 15, 17, 20 (832 x 624)	Portrait Display	21-in Monochrome	Multi-Scan 17 and 20 (1024 x 768)

Display Card 24 AC	16.7M C	16.7M C	16.7M C	16.7M C

C = Number of Colors
G = Number of Grays

(1) Requires Display adapter to use Multiple Scan Displays at this resolution.

(2) Can be upgraded with eight (8) Mac II Video Expansion RAM chips for 256 grays/colors.

(3) The 4*8 can be upgraded to a 8*24 by adding two (2) VRAM SIMMs.

(4) Available with rev. B ROM.

(5) Available with rev. B card.

C = Number of Colors
* = HDI-45 port makes use of 640K of internal DRAM memory

(1) For the AV computers, pixel and viewable color numbers are for computer graphics only. When video is enabled, VRAM is split evenly between graphics and video.

(2) When the ATI graphics card is used you can get 256 C with 2MB of VRAM on the card. You get 32,768 C with 4MB of VRAM on the ATI card.

PowerBook Family

PowerBook	**VRAM**	**21-in Color, Multiple Scan 20 Display @ 1152 x 870**	**1710 1710AV @ 1280 x 1024**
160,165,165c,180, 180c	--	N/A	N/A
500 Series	--	N/A	N/A
3400 Series	--	N/A	N/A
G3	--	N/A	N/A
Duo Dock	512K 1MB	N/A N/A	N/A N/A
Duo Dock II	--	N/A	N/A
MiniDock	512K	256 C	N/A

C = Number of Colors

3400 Notes:
1) The computer does not provide a display with 2 bits per pixel.

2) An SVGA monitor's display resolution will be 640 by 480 pixels. The user can switch to a higher resolution by using the Monitors control panel or the control strip. The resolution set by the user will be used the next time the computer is started up.

3) If the external monitor can display 800 by 600 pixels at 60 Hz, the PowerBook 3400 computer can display simultaneously on both the external monitor and the flat panel display. This mode of display, called Simulscan, provides the same information on both displays.

Macintosh Video Cards

Video Card	**21-in Color, Multiple Scan 20 Display @ 1152 x 870**	**1710 1710AV @ 1280 x 1024**
Macintosh II	N/A	N/A
2-Page Mono Card	N/A	N/A
Portrait	N/A	N/A
Mono	N/A	N/A
High-Res Card (2)	N/A	N/A

Ext High-Res Card	N/A	N/A
4*8 (3)	16 C (1)	N/A
8*24	256 C (2)	N/A
8*24GC	256 C (2)	N/A
Display Card 24 AC	16.7M C	N/A

C = Number of Colors

(1) Requires Display adapter to use Multiple Scan Displays at this resolution.

(2) Can be upgraded with eight (8) Mac II Video Expansion RAM chips for 256 grays/colors.

(3) The 4*8 can be upgraded to a 8*24 by adding two VRAM SIMMs.

Macintosh Monitor Sense Codes: Technical Description

The following article provides a detailed explanation of the standard and extended sense codes used to determine which monitor is connected to a particular Macintosh computer or video card. Additional information can be found in article 14890: "**Macintosh Displays: Overview of Sense Codes and Adapters**".
This article has been archived and is no longer updated by Apple.

Sense Lines

The sense line protocol was implemented when Apple recognized the need for a mechanism that would allow a display card to identify the monitor connected to it. For example, the built-in video display circuitry on CPUs such as the Macintosh Quadras and the PowerBook 160 and 165c can configure itself according to the monitor that is connected at boot time. The identification scheme works fine, but there is one problem. There are only three sense lines and this limits the number of different monitors to seven plus the no-connect case. To overcome this limitation, newer display cards and built-in video use extensions to the sense line scheme that allow for new codes.

The first extension, type-7, is based on the following idea: When the display circuitry senses a configuration that in the original scheme signals "no display connected" (i.e. when none of the three sense lines are grounded), the card pulls down each sense line, one by one, and reads what the other lines return. To return a unique code, the only requirement is that the sense lines be interconnected, in the cable or the monitor itself, by wires or diodes. The beauty of this idea is that existing monitors are detected correctly and newer monitors can have their own encoding. The circuitry for detecting new monitors is relatively simple and has no active components. Adding the encoding to new or existing monitors involves only inexpensive diodes and wire. The type-6 extension has a similar approach.

The Original Scheme

In the original scheme, the display circuitry determines the type of monitor attached by reading three sense lines and comparing the signal value to ground. By convention, the sense lines are identified as 2, 1, and 0. Given three lines and two different states, on or off, there are a total of eight possible combinations. For a monitor to be recognized, a sense line on the monitor side is connected to ground to be read as a binary 0, or left unconnected to be read as a binary 1.

The first seven monitors listed in Table S-1 show the required sense line states for them to be recognized using the original sense line scheme. It's worth noting that monitors using the original scheme need only have their sense lines read once to determine the monitor type. As new monitor types became available for the Macintosh, the extended sense line protocol was implemented.

Extended Type-7 Sense Codes

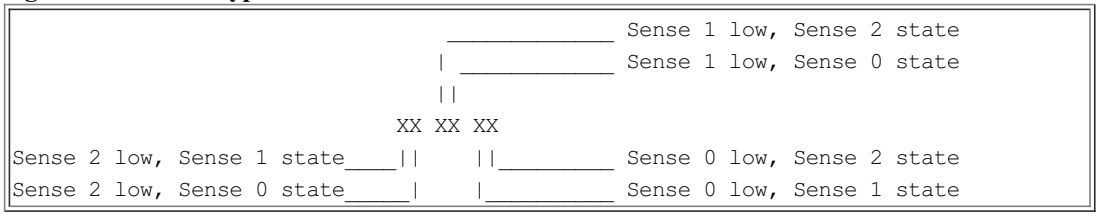
The extended sense line protocol is one of those oddities of software engineering that at first seems to defy logic. The protocol sets a standard for defining a 6-bit binary number that represents how the sense lines must respond for the monitor to be recognized correctly.

With this unusual introduction, let's step back. Under the original scheme, sense lines were compared to ground to determine their state. To reiterate, with three pins there are a total of eight possible combinations, 000 (all grounded) to 111 (none grounded). Seven combinations of the sense line states are assigned to early monitor types. The eighth combination, 111 (signifying "no display connected" in the original scheme), is used to signal the extended type-7 sense line code protocol. This is also known as the no-connect sense line code protocol. The type-7 designation derives from the fact that the three sense lines are high relative to ground and can be represented in binary format as 0b111 or $07.

To implement the type-7 sense line protocol, the sense lines get tied to each other within the monitor using a combination of straight wire and/or diode connections. When the display system software reads the state of the three monitor sense lines and finds that none of them are grounded, it begins dynamic polling. The software tells the video card/hardware to assert each sense line and read the other two lines. Instead of being compared to ground, each line is compared to the asserted line. If a sense line has the same state as the asserted sense line, the state equates to a binary 0, otherwise it is binary 1.

The diagram in Figure 1 illustrates the type-7 sense line protocol notation. There are three pairs of binary numbers. Each pair of binary digits represents the relative state of two sense line pins to the third, which is held low. The pairs are always in the order: sense 2 low, sense 1 low, sense 0 low. Each bit in a pair is sense line specific, with the higher sense line bit to the left.

Figure 1: Extended Type-7 Sense Line Decode Method



Extended Type-6 Sense Line Protocol

When the Display Manager was implemented, the sense line protocol was extended further for a new family of monitors. The same method that gives the extended type-7 sense line protocol its designation applies to the three cases where one sense line is grounded. For the extended type-6 sense line protocol, pin 4, i.e. sense line 0, is grounded to pin 11 (see Table S-3) and the binary notation is expressed as 0b110 ($06) with the least significant bit representing sense line 0.

From Table S-1 below, note that the sense line configuration for this case corresponds to the Apple Hi-Res monitor. To extend the support of monitors in this family, one can add three new codes by connecting sense lines 1 and 2 with a jumper, or a diode in either direction. These new extended type-6 sense codes support three new monitor types that are capable of supporting the standard 640 x 480 resolution and other resolutions. See "Multiple Scan Monitors" below.

Multiple Scan Monitors

The Power Macintosh VRAM expansion cards include support for three new monitor types which use the extended type-6 sense codes. These new types are multiple scan rate monitors, which can display in multiple screen resolutions. The VRAM expansion cards being shipped with the Power Macintosh units will support the multiple scan monitors with the resolutions listed in Table 1.

Note: The Apple Multiple Scan 17 Display is sensed as a multiple scan 16 display type, and the Apple Multiple Scan 20 Display is sensed as a multiple scan 21 display type.

Table 1: Supported Multiple Scan Screen Resolutions

Monitor Type	Screen Resolution	Frame Rate (Hz)
Multiple Scan 14	640 x 480	66.67
	832 x 624	74.55
Multiple Scan 16	640 x 480	66.67
	832 x 624	74.55
	1024 x 768	74.93
Multiple Scan 21	640 x 480	66.67
	832 x 624	74.55
	1024 x 768	74.93
	1152 x 870	75.08

Summary

The three tables below summarize the contents of this tech note.

Table S-1 Sense Line Code Assignments

Monitor Type	Sense 2	Sense 1	Sense 0	Frame Rate (Hz)
RGB 21"	0	0	0	75.08
Full-Page (B&W 15")	0	0	1	75.08
RGB 12"	0	1	0	60.15
Two-Page (B&W 21")	0	1	1	75.08
NTSC Monitor	1	0	0	59.94 á
RGB 15"	1	0	1	75.08
Hi-Res (12-14")	1	1	0	66.67
Multiple Scan 14" *	1	1	0	See Table 1
Multiple Scan 16" *	1	1	0	See Table 1
Multiple Scan 21" *	1	1	0	See Table 1
No Display Connected	1	1	1	N/A
PAL Encoder *	1	1	1	50.00 á
NTSC Encoder *	1	1	1	59.94 á
VGA *	1	1	1	59.94
Super VGA *	1	1	1	55.98
RGB 16" *	1	1	1	74.55
PAL Monitor *	1	1	1	50.00 á
RGB 19" *	1	1	1	74.93
* - These monitors require extended sense line support. á - Interlaced timing.				

Note: The binary values in this table indicate the relative state of the sense pin measured against monitor ground, pin 11, on the DB-15 connector depicted in Table S-3 below.

Table S-2 Extended Sense Line Code Assignments

Monitor Type	Sense 2 Low 1 & 0	Sense 1 Low 2 & 0	Sense 0 Low 2 & 1
Multiple Scan 14" *	00	00	11
Multiple Scan 16" *	00	10	11
Multiple Scan 21" *	10	00	11
PAL Encoder	00	00	00
NTSC Encoder	01	01	00
VGA/Super VGA	01	01	11
RGB 16"	10	11	01
PAL Monitor	11	00	00
RGB 19"	11	10	10
* Type-6			

Note: In this table, the column under "Sense 2 Low 1 & 0" indicates the values the software is reading from monitor sense lines 1 and 0 while driving sense line 2 low. Suppose you have a PowerBook 180c and you want it to believe there is an Apple 16" RGB monitor attached. The sense line code in Table S-2 for this monitor is 10 11 01. As shown in Figure 3, this sense code equates to sense line 2 being connected to sense line 0 with a jumper. Based on Table S-3, your tying pin 4 to pin 10 will make the PowerBook think that the 16" monitor is attached. It's important to recognize that pins 4 and 10 in this example must not be tied to ground, otherwise, a 12" RGB monitor would be indicated.

Table S-3 Signal Assignments for the DB-15 External Video Connector

Pin	Signal Name	Signal Description
1	RED.GND	Red Ground
2	RED.VID	Red Video Signal
3	/CSYNC	Composite Sync Signal
4	SENSE0	Monitor Sense Line 0
5	GRN.VID	Green Video Signal
6	GRN.GND	Green Ground
7	SENSE1	Monitor Sense Line 1
8	Not Connected	Not Connected
9	BLU.VID	Blue Video Signal
10	SENSE2	Monitor Sense Line 2
11	C&VSYNC.GND	Ground for CSYNC & VSYNC
12	/VSYNC	Vertical Sync Signal
13	BLU.GND	Blue Ground
14	HSYNC.GND	HSYNC Ground
15	/HSYNC	Horizontal Sync Signal

Power Macintosh: Meaning of Error Type 11

This article discusses troubleshooting Type 11 errors.
This article has been archived and is no longer updated by Apple.
A Type 11 error is listed as a hardware exception error. However, as with all Macintosh Type xx errors, they usually do not identify a particular software or hardware component error. Type xx errors are more general in nature.

Troubleshooting Type 11 Errors

When troubleshooting Type 11 errors, always eliminate software problems first, then check the hardware.

To troubleshoot the problem, follow these steps:

1. Upgrade your hard disk drivers and system software to the latest versions available.
2. Contact the software vendor for compatibility information if the problem only occurs in one application, and you can reproduce it consistently.
3. Turn off all extensions and control panels if the error occurs in an application that is fully compatible with a Power Macintosh computer. Check the application again. If the problem goes away, then troubleshoot your extensions, control panels or fonts. Large numbers of fonts can cause similar errors, troubleshoot by moving them from the Fonts folder to another folder. If you still have problems, follow Step 4.
4. Perform a clean installation of the system software, then test the system performance for a few days. If the problems continue, particularly in the Finder, there may be an issue with your Apple or non-Apple hardware.
5. Disconnect any external or internal SCSI devices that have been may added (or exchanged for the original Apple hardware) and continue testing. Since SCSI device drivers load into memory when the Macintosh is turned on, they can generate conflicts similar to extension conflicts. If you are using a non-Apple formatting utility, contact the vendor of the utility for compatibility information. Removing internal SCSI devices is best performed by an Apple-authorized service provider.
6. Remove any extra third-party RAM and test. This is best performed by an Apple-authorized service provider. Also verify that you are not using composite RAM.
7. Remove Level 2 Cache RAM, if present, and test.

If you continue to get Type 11 errors using a clean version of the system software without any third-party hardware attached (including internal or external SCSI devices, additional RAM, or Level 2 cache RAM), you need to have your computer serviced by an Apple-authorized service provider.

For additional information about the cause of Type 11 errors, refer to article 18912: "**Power Macintosh: Type 11 & No FPU Errors Technote**"

QuickTime: Playing a Startup Movie

Is it possible to have a QuickTime movie play on screen during system startup?
This article has been archived and is no longer updated by Apple.
To have a QuickTime movie play on screen during system startup, take an existing QuickTime movie, rename it "Startup Movie" and put it in your System Folder (root level). Now, when you start up the computer the movie plays automatically when the QuickTime extension loads.

The movie plays in a small window in the middle of your monitor screen. No tools are available (such as pause, rewind, sound). The movie window does not go away until the rest of the extensions finish loading. After that, the screen normally clears itself.

Toner Cartridges: Compatibility List for Other Printers

Does Apple support the use of Apple LaserWriter toner cartridges in printers from other vendors that use the same print engine?
This article has been archived and is no longer updated by Apple.
Apple encourages the use of Apple toner cartridges in laser printers that use a compatible print engine. A comprehensive listing of the current Apple toner cartridges and compatible third-party printers are listed below.
.

Apple Toner Cartridge Part Number	Printer Manufacturer	Models Supported
M6002	Apple	LaserWriter IISC, LaserWriter IINTX, LaserWriter IIF, LaserWriter IIG
M6002	Blaser	Blaser II
M6002	Brother	HL-8, HL-8D, HL-8E, HL-8PS/AP, HL-8V
M6002	Canon	LBP-SX, LBP-200V, LBP-8 II, LBP-8 II R, LBP-8 II T, LBP-8 III, LBP-8 III R, LBP-8 III T, LBP-8 III RX, LBP-8 III TX
M6002	Compugraphic	CG408
M6002	Comterm	Laser II
M6002	CPT	LP-8
M6002	Data General	6454

Notes

- Apple does not recommend the use of refilled toner cartridges in LaserWriter printers. For more information, search the Knowledge Base using the keywords "LaserWriter,toner, cartridge".
- Toner cartridges made specifically for Canon copiers are not compatible with the LaserWriter, LaserWriter Plus, LaserWriter II, and Personal LaserWriter printers. Cartridges made for the Canon Laser Printer and Hewlett-Packard cartridges made for the HP LaserJet are compatible. The Apple LaserWriter, LaserWriter Plus, and LaserWriter Pro series printers use the EP cartridge type. Apple LaserWriter II series printers use the EPS cartridge type. Apple Personal LaserWriter NT, NTR, and LS printers use the EP-L cartridge type. The Apple Personal LaserWriter 300 uses the EP-P cartridge type. Apple LaserWriter Pro 600 series printers use the EP-E cartridge type.

AppleShare: Platforms and Mac OS Releases Supported

This article explains which versions of AppleShare are supported with which computers and version of the Mac OS.

Note: Supported means users can expect technical assistance from Apple and all issues will be prioritized along with other development efforts. This article has been archived and is no longer updated by Apple.
Note: AppleShare IP is not supported on any Apple computer released after 2001-02-01.

Supported Platforms	
AppleShare Version	**Computers**
AppleShare 3.0.1	Macintosh computers with a Motorola 68000, 68020, or 68030 processor. System 7.0 through System 7.5.1
AppleShare 4.0	All users should update to AppleShare 4.0.1
AppleShare 4.0.1/4.0.2	All Motorola 68040-based computers, except Quadra 660AV and Quadra 840AV. (See Notes 1 and 2)
AppleShare 4.0.2	PowerPC-based computers with clock speeds less than or equal to 80 MHz (except Power Macintosh 6100/66 and 7100/80). (See Note 3)
AppleShare 4.1	All NuBus PowerPC-based computers available through 1995-04 (not Power Macintosh 7200, 7500, 8500, or 9500 computers).
AppleShare 4.2	All NuBus PowerPC-based computers (not Power Macintosh 7200, 7500, 8500, or 9500 computers). All users should update to AppleShare 4.2.1
AppleShare 4.2.1	Works with PCI- and NuBus-based Workgroup Servers and Power Macintosh computers. AppleShare 4.2.1 is compatible with Open Transport on PCI-based Power Macintosh 7200, 7500, 8500, and 9500 computers. AppleShare 4.2.1 will **not** run on any computer with a Motorola 68000-family microprocessor.
AppleShare IP 5.0	Any Apple Power Macintosh or Apple Workgroup Server with a PowerPC 601, 604, or 604e processor. Not supported on Power Macintosh computers with 603 or 603e processors. Not supported on non-Apple computers.
AppleShare IP 5.0.3	Any Apple Power Macintosh or Apple Workgroup Server with a PowerPC 601, 604, 604e, or G3 processor. Not supported on Power Macintosh computers with 603 or 603e processors. Not supported on non-Apple computers.
AppleShare IP 6.0, 6.1, 6.1.1, 6.2	Any Apple Power Macintosh or Apple Workgroup Server with a PowerPC 601, 604, 604e, or G3 processor. Also supported on the Power Macintosh 6500 series. Not supported on Power Macintosh computers with 603 or 603e (except for the Power Macintosh 6500). Not supported on non-Apple computers. All users should update to ASIP 6.1.1; ASIP 6.2 is recommended.
AppleShare IP 6.3, 6.3.1, AppleShare IP Agent Update 6.3.2, AppleShare IP 9.0.4 Update	Any Apple Power Macintosh computer, iMac, or Macintosh Server with a PowerPC 601, 604, 604e, G3, or single G4 microprocessor, or a Power Macintosh 6500 series computer with a 603e microprocessor. Not supported on dual-processor Power Mac G4 computers or Power Macintosh computers with 603 or 603e (except for the Power Macintosh 6500). Not supported on non-Apple computers.
AppleShare IP 6.3.3	Any Apple Power Macintosh computer, iMac, or Macintosh Server released prior to 2001-07-18 with a PowerPC 601, 604, 604e, G3, or G4 microprocessor(s), or a Power Macintosh 6500 series computer with a 603e microprocessor. Not supported on Power Macintosh computers with 603 or 603e (except for the Power Macintosh 6500). Not supported on non-Apple computers. (See Notes 6, 7.)
AppleShare IP 6.3.3 v1.2	Macintosh Server G4 (QuickSilver) with AppleShare IP (See Note 7.)

AppleShare IP 6.3. 3 v1.3	Macintosh Server G4 (QuickSilver 2002) with AppleShare IP (See Note 7.)

Supported Mac OS Releases	
AppleShare Software Version	**System Software Version**
AppleShare 3.0.1	System 7.0 or later. System 7.1 is recommended
AppleShare 4.0.1/4.0.2	System 7.0.1 (with System 7 Tune-Up 1.1.1) through System 7.5.3 with Classic AppleTalk only. It is not compatible with Open Transport networking. System 7.1 is recommended.
AppleShare 4.1	System 7.5.1 only
AppleShare 4.2	System 7.5.1 only (ALL users advised to update to AppleShare 4.2.1.)
AppleShare 4.2.1	System 7.5.3 through Mac OS 7.6. This release is compatible with Open Transport networking.
AppleShare IP 5.0	Mac OS 7.6, and Mac OS 7.6.1 only on computers that cannot run Mac OS 7.6, such as the Power Macintosh 7300/7350/8600/9600/9650 computers.
AppleShare IP 5.0.3	Mac OS 8.0 and Mac OS 8.1; Mac OS 8.1 is recommended.
AppleShare IP 6.0	Mac OS 8.1 with OpenDoc 1.2.1.
AppleShare IP 6.1 and 6.1.1	Mac OS 8.1 minimum, Mac OS 8.5 or 8.5.1 recommended. OpenDoc 1.2.1 required.
AppleShare IP 6.2	Mac OS 8.6 with OpenDoc 1.2.1 required.
AppleShare IP 6.3	Mac OS 9.0 (OpenDoc not required)
AppleShare IP 6.3.1	Mac OS 9.0.3, Mac OS 9.0.4 (OpenDoc not required)
AppleShare IP Agent Update 6.3.2, AppleShare IP 9.0.4 Update	Mac OS 9.0.4 (OpenDoc not required. See Note 5.)
AppleShare IP 6.3.3	Mac OS 9.1 (OpenDoc not required. See Note 7.) **Note:** Not supported with Mac OS 9.2.
AppleShare IP 6.3.3 v1.2	Mac OS 9.2.1 or 9.2.2 (See Note 7.)
AppleShare IP 6.3.3 v1.3	Mac OS 9.2.2 (See Note 7.)

AppleShare Client and Mac OS Releases	
System Software	**Recommended AppleShare Client**
System 7.5 and earlier	AppleShare Client 3.5
System 7.5.1 through 7.5.2	AppleShare Client 3.6.5
System 7.5.3 through 7.5.5	AppleShare Client 3.7.4 with Open Transport 1.1.2
Mac OS 7.6 through 8.0	AppleShare Client 3.8.3
Mac OS 8.1 through 9.0.4	AppleShare Client 3.8.6. (See Note 4)
Mac OS 9.1	AppleShare Client 3.8.8
Mac OS 9.2.1	AppleShare Client 3.9

Notes:

1. From a functional standpoint, AppleShare 4.0.1 is identical to AppleShare 4.0.2 for 68040-based Macintosh computers. There is no need to upgrade AppleShare 4.0.1 to AppleShare 4.0.2. The only differences between these versions are the version number itself, and that AppleShare 4.0.2 was available in a complete retail package, while AppleShare 4.0.1 is available as a tune-up only requiring installation over an existing copy of AppleShare 4.0.
2. If you have a Workgroup Server 95, do not upgrade to System 7.5 or later. A Workgroup Server 95 with A/UX only works with System 7.0.1 and System 7 Tune-Up 1.1.1.
3. AppleShare 4.0.2 for Power Macintosh is no longer sold separately.
4. AppleShare Client 3.8.6 requires Keychain, part of Mac OS 9, to automatically connect to server volumes at system startup time. Mac

OS 8.1 through 8.6 users who rely on this feature may wish to use AppleShare Client 3.8.3 instead. Before doing so, please see article 25038: **"Mac OS 8.6: Cannot Save AppleShare Log-On Password"** for known limitations and other alternatives.
5. Macintosh computers with Mac OS 9.0.4 and Mac OS ROM 4.6 and later require the ASIP Agent Update 6.3.2.
6. AppleShare IP 6.3.3 provides compatibility for dual-processor Power Mac G4 computers but does not provide multiprocessing performance enhancement.
7. AppleShare IP 6.3.3 is supported only on Mac OS 9.1. The Power Mac G4 (QuickSilver) and Power Mac G4 (QuickSilver 2002) computers require minimums of Mac OS 9.2.1 and 9.2.2, respectively. They require minimums of AppleShare IP 6.3.3 v1.2 and 6.3.3 v1.3, respectively. The only changes in v1.2 and v1.3 were made in the Installer Scripts, so they will install on newer computers with versions of Mac OS 9.2.x installed. The appropriate version of AppleShare IP is currently available to education customers with purchase of a new Macintosh Server G4 with AppleShare IP bundle. **This software is not sold separately, and non-education customers do not have this option.**

Updates for AppleShare are available from Apple Software Updates (http://www.apple.com/swupdates/).

PCMCIA for PowerBook: Frequently Asked Questions (1 of 2)

This article contains frequently asked questions (FAQ) regarding the PowerBook PCMCIA Expansion Module for the PowerBook 500 series, and the built-in PCMCIA (PC card) bay used in many other PowerBook computers, with answers to these questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Can I plug PC Cards into my PowerBook on the fly?
2. Will the Apple PCMCIA modem for the Newton work with PowerBook 500 PCMCIA Expansion Module, and other PowerBook models with PC card slots?
3. Will Newton storage cards work with PCMCIA capable PowerBook computers?
4. If I insert a DOS formatted drive card, will it be recognized by my PowerBook?
5. How do I initiate the ejection of a PC Card?
6. How are cards physically ejected from my PowerBook and how do I get them out if that method fails?
7. The card will not eject from my PowerBook even when I insert a paper clip. What now?
8. Can I start my PowerBook from a PC Card?
9. How much power does the PCMCIA Expansion Module draw?
10. What kind of power draw can I expect from PC cards in a PowerBook?
11. How do I protect the PDS connector on the PCMCIA Expansion Module when it is removed?
12. I understand there are three types of PC Cards, how many of each type will PCMCIA-capable PowerBooks accept?
13. Are there standards which assure that every PC Card is the same size?
14. Which PC Cards can I use with the PCMCIA Expansion Module and with the PowerBook 5300/1400 computers?

Question 1: Can I plug PC Cards into my PowerBook on the fly?

Answer: Yes, individual cards can be plugged in at any time the PowerBook is powered on and they will be recognized. If, however, the actual PCMCIA Expansion Module is inserted or removed while the unit is powered on or in sleep mode, the unit will shut down.

Question 2: Will the Apple PCMCIA modem for the Newton work with PowerBook 500 PCMCIA Expansion Module, and other PowerBook models with PC card slots?

Answer: Yes, the Apple PCMCIA modem for the Newton will work with PCMCIA capable PowerBooks provided you are using a communications application that uses the CTB (Communications Toolbox). The vast majority of communications programs currently available are CTB compliant.

Question 3: Will Newton storage cards work with PCMCIA capable PowerBook computers?

Answer: No, Newton storage cards will not work with PowerBook computers. They use a different PCMCIA implementation and many are too wide to properly fit into a PowerBook.

Question 4: If I insert a DOS formatted drive card, will it be recognized by my PowerBook?

Answer: If PC Exchange 2.0.2 or later is installed, the drive will be mounted on the desktop and you'll have full access to its files. PC Exchange itself does not do anything with regard to file format. However, you may or may not have an application on your PowerBook which can do anything useful with the PC files.

Question 5: How do I initiate the ejection of a PC Card?

Answer: PC Cards should eject if the desktop icon is dragged to the Trash or if Put Away is selected from the Special menu.

Question 6: How are cards physically ejected from my PowerBook and how do I get them out if that method fails?

Answer: PC Cards are ejected by a mechanism triggered by a thin bi-metallic wire called NitiNol (Nickel Titanium alloy) which contracts when a voltage is applied to it. This contraction triggers the mechanism to eject the card. If you are having trouble ejecting a PC Card, a paperclip can be inserted into the small hole next to the PCMCIA slot to manually eject the card. Avoid manually pulling the card out of the computer - this could leave the mechanism set in the wrong position (see the next question).

Question 7: The card will not eject from my PowerBook even when I insert a paper clip. What now?

Answer: You can pull the card out yourself with a pair of needle nose pliers or sometimes with your fingers, if you have strong fingernails. Once the card is pulled out, try inserting the paper clip again to release the spring mechanism. If you hear the springs release, you can try inserting the card (or a different card) again. Of course, the issue may recur.

Inspect the card for any obvious physical damage, large scratches, or other irregularities. If the ejection issue recurs, especially with various cards, you should have your PCMCIA Expansion Module or PowerBook inspected by an Apple Authorized Service Provider or returned to Apple by calling 1-800-SOS-APPL.

Question 8: Can I start my PowerBook from a PC Card?

Answer: The PC Card slots are polled at startup, so if a card is inserted which contains the appropriate resources to start up the PowerBook and the startup control panel has the PCMCIA device selected, it will boot from the card.

Question 9: How much power does the PCMCIA Expansion Module draw?

Answer: Idle with no cards: .460 mA...less than 1 milliamp.

Operating with cards: Typical is 56mA plus inserted cards power draw. Maximum is 58mA plus inserted cards power draw.\\

The cards can vary from 150mA for modems to 600mA for rotating media. (New ExCA spec is trying to limit cards to 300mA.) Also, some cards have very high peak requirements (spinning up drive).

The PowerBook 500 series PDS connector is rated at 600mA continuous for the entire PDS module.

Question 10: What kind of power draw can I expect from PC cards in a PowerBook?

Answer: The following numbers are based on initial testing by Apple Computer. Some cards may vary from these numbers.

Type of Card	Plugged In	Active
Modems	100-300mA	100-390mA
Memory	3-21mA	100mA
Hard Disks	200-300mA	300-350mA
Ethernet	285-480mA	285-480mA

Question 11: How do I protect the PDS connector on the PCMCIA Expansion Module when it is removed?

Answer: A small cover for the connector is included with the module. This cover should be in place any time the module is removed from the PowerBook.

Question 12: There are three types of PC Cards, how many of each type will PCMCIA-capable PowerBooks accept?

Answer: There are two card slots which can accept one each Type I or Type II, or a single Type III card in the bottom slot.

Question 13: Are there standards which assure that every PC Card is the same size?

Answer: The PCMCIA PC Card standard only defines a specification for the pin configuration and the height of the card. The most common variations are the width of the card and rounding of the corners. If you have problems with the fit of a PC Card, try using the bottom slot.

The specification defines all dimensions for a Type II except radius of corners. In reality, not all cards (but most) conform to the spec. Some modem Type II specs exceed the 5mm height. The 5mm is a maximum.

What is undefined for Type III cards is the top case minimum dimensions. The maximum is defined, so cards that conform to the maximum work with the connector. Variants of the spec (unusual shapes and divots) in the top case can cause issues.

Question 14: Which PC Cards can be used with the PCMCIA Expansion Module and with the PowerBook 5300/1400 computers?

Answer: With the PCMCIA Expansion Module for the PowerBook 500 series, you can use modem cards that conform to the PCMCIA 2.1 standard and flash cards and hard disk cards that conform to the ATA standard.

PCMCIA on other PowerBook models offer full Card and Socket Services support. This means that any 3rd party developer can modify their software drivers to make their cards available on the Macintosh. Card and Socket Services is part of the PCMCIA industry standard.

Other PCMCIA for PowerBook FAQ's can be found in the following article:

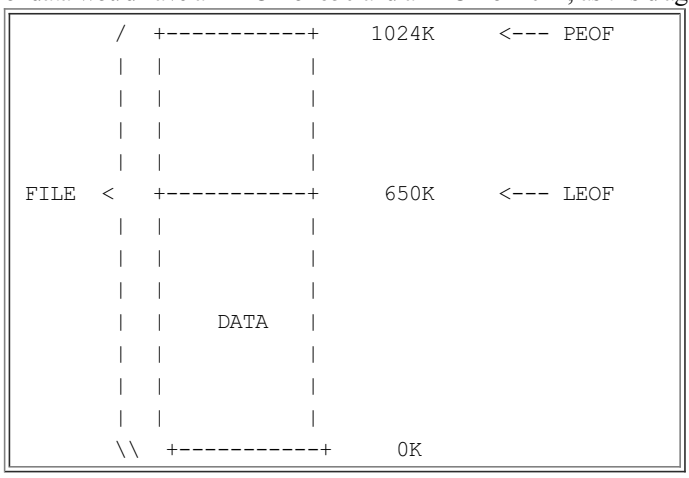
Disk First Aid: Invalid PEOF Error

Disk First Aid reports an "Invalid PEOF" error with some numbers after it. It says it is unable to repair the problem. Norton Utilities Disk Doctor reports no error could be found. What is an Invalid PEOF?
This article has been archived and is no longer updated by Apple.
An "invalid PEOF" is an invalid Physical End Of File.

This error means Disk First Aid found a problem with the length of a particular file and cannot fix it. Macintosh files have two end of file markers -- a Logical End Of File (LEOF) and a Physical End Of File (PEOF). The logical end of file is the number of bytes allocated to data in a file. The physical end of file is the number of bytes currently allocated to the whole file.

The Macintosh allocates "blocks" of space to files on a volume (disk) for efficiency in reading/writing the files. The block size varies depending on the volume size. Most files never completely fill up their allocated blocks.

For example, if a given block size for a volume is set to 512K bytes and a file is allocated 2 blocks (1024 bytes total in file), a file with 650 bytes of data would have an LEOF of 650 and a PEOF of 1024, as this diagram illustrates:



If the PEOF is less than the LEOF, then problems with reading a file may occur. Disk First Aid is finding a PEOF allocation problem. Of course, if this problem is in the Desktop files or the System file, then system crashes and other anomalies may result.

If Disk First Aid cannot repair the problem, you should consider backing up the data and reformatting the drive -- even if other utilities give the drive a clean bill of health. Each disk utility program is good at finding different problems. Trusting your data to only one utility is never wise. The conflicting reports are usually a sign that something is wrong with the file system and it needs to be fixed.

QuickTime: Performance Tips for Digitizing Video

This article provides tips for producing digitized video. There are a number of things you can do to improve capture performance and increase the frame rate of your movies. Some of these tips improve performance, and others only adjust performance marginally.
This article has been archived and is no longer updated by Apple.

PRODUCTION STRATEGIES

One of the most important elements in producing QuickTime video movies is the quality of the original footage. The better the quality of the original video, the better the quality of the final QuickTime movie.

- Hi-8, S-VHS, Beta or 3/4" (Umatic) video produces better results than VHS or 8mm
- Always use a new tape when shooting.
- Add light when shooting indoors to improve contrast and reduce video noise.
- Use a tripod to reduce camera shake.
- Avoid large sudden movements of the camera, either pans or zooms.
- Move the microphone off camera if possible. Purchase a shot-gun microphone.

Making the Connection
Do not overlook the connections between your equipment!

- Use S-Video cable rather than RCA cables (if possible). S-Video signal retains more fidelity than the composite signals.
- Use good quality cables and connectors.
- Use component video (separate RGB cables) rather than S-Video cable if your digitizing board and VCR support this type of connection.

TIPS FOR IMPROVING THE FRAME RATE

Defragment your disk drive!
A badly fragmented drive impacts performance.

Turn Off AppleTalk and Non-Essential Extensions
Turning off AppleTalk improves performance. Turning off other non-essential screen extensions can also improve performance.

Set the Screen Depth to 16 Rather than 24 Bits
If your digitizing card supports both 16 and 24 bit screen depths, then digitize at 16 bits; particularly if you are using the Apple Video Compressor.

A 16 bit image is 2/3 the size of a 24 bit image. The smaller sized image can be passed around much faster. The image quality of 16 versus 24 is very similar. The Apple Video Compressor only saves 16 bit information anyway.

QuickTime relative performance in order of bit-depth, 1 being better performance:

1. 16-bit
2. 24/32-bit
3. 8-bit
4. 1-bit

Reduce the Frame Size
The size of the frame affects the frame rate. Reducing the frame size increases the frame rate of the movie. When adjusting the frame size remember to check the frame size before recording. Note down the frame size and check it before you begin a recording session. It's very easy to adjust the frame size for one or two movies, then forget to adjust it for a second digitizing session.

Use the None Compressor
Capturing using the None Compressor generally produces the highest frames rates (though if you have a fast processor, the Apple Video Compressor may be just as efficient.) Capture using the None Compressor and then recompress using the Apple Video Compressor or the Compact Video Compressor. Several Applications, including VideoShop (Avid) and Movie Recorder (Apple) offer automatic post-compression options. These programs capture using the None Compressor, then immediately recompress using the compressor of your choice. We don't recommend using the Compact Video compressor in these situations.

Note: This does NOT apply to recording using the VideoSpigot with the ScreenPlay application. ScreenPlay uses a special compressor which provides much higher frame rates. Also, if you are using the VideoSpigot, then use the application ScreenPlay to capture movies rather than recording in an application like Premiere or Movie Recorder. Much higher frame rates are possible using ScreenPlay.

Use Faster Equipment
* Faster storage device. A faster hard disk usually improves your capture performance.

QuickTime relative performance on storage devices, 1 being better performance:

1. RAID devices on PCI SCSI cards
2. RAID devices on NuBus SCSI cards
3. Large internal hard disks on direct SCSI interfaces
4. Large internal hard disks on IDE interfaces
5. Small internal hard disks on direct SCSI interfaces
6. Small internal hard disks on direct IDE interfaces
7. Quad speed CD-ROM drives
8. Double speed CD-ROM drives
9. Single speed CD-ROM drives
10. Floppy disks

- Faster processor. A faster processor improves your capture performance. QuickTime relative performance on processors, 1 being better performance:

1. 150Mhz PowerPC 604
2. 132Mhz PowerPC 604
3. 120Mhz PowerPC 604
4. 110Mhz PowerPC 601
5. 100Mhz PowerPC 601
6. 40Mhz Motorola 68040
7. 66/33 MHz Motorola 68040 (includes FPU)
8. 66/33 MHz Motorola 68LC040
9. 117Mhz PowerPC 603e
10. 100Mhz PowerPC 603e

- Hardware compression boards (such as RasterOps MoviePak, SuperMacs DigitalFilm, and Radius VideoVision Studio) produce the highest frame rates possible. All three are capable of 30 frames per second, but they require fast processors (ideally a Quadra), fast hard disks (usually a disk array) and produce very large files which can take a long time to recompress.

Use Special Capture Applications
It is possible to capture high frame rate movies without buying a new computer or hardware acceleration board. The utility Grab Guy (on the Apple QuickTime CD) performs multi-pass captures using a computer controllable Sony VCR (generally only the professional decks with time code support). Grab Guy captures every 6 frames (or so) and does multi-passes to record the whole movie.

VideoToolKit from Abbate Video offers a step-record option. Using just about any controllable VCR, VideoToolKit places the VCR in pause, digitizes the frame, steps the VCR forward a frame, and digitizes the next frame. This requires a VCR with a clean pause, and places extra stress on the tape, but is a cheap alternative for capturing clips.

DETERMINING THE OPTIMUM FRAME RATE
It's important to remember that the optimum frame rate is dependent not just on the capture hardware, but also on the playback platform. If you are recording for distribution on CD-ROM, Apple recommends the following:

180 x 160 at 12 frames per second (compressed using Apple Video Compressor) 240 x 180 at 12 frames per second (compressed using the Compact Video Compressors)

These numbers are designed to provide acceptable performance when playing on an LC from a standard speed CD-ROM. If the processor speed is larger, or a double-speed CD-ROM is assumed, then these figures increase.

KNOW YOUR COMPRESSION ALGORITHM
The more you know about the compression algorithm you are using, the better you will know how to use it, and how to adjust the various parameters for best results. For example, reducing the luminance (brightness information) information in an image will have a greater effect on compression performance than adjusting the chrominance (color). Most compression algorithms make use of the fact that the eye is less sensitive to changes in chrominance information than changes in luminance information . Many algorithms use color-subsampling to reduce the chrominance information. However, reducing the luminance information can reduce the data rate as well.

- Make sure the frame size is divisible by 4. The Compact Video Compressor is most efficient if the frame size (both horizontal and vertical) is evenly divisible by 4. i.e. 240 x 180 is okay, but 242 x 182 is not as efficient.

ADJUST KEY FRAMES
Reducing the frequency of key frames will usually reduce the data rate, and improve performance, however reducing the key frame rate reduces

performance when playing the movie in reverse, or when trying to skip ahead in a movie. Generally the Key Frame rate should be set to one per second of video, but if you know the movie will not be interrupted, searched or played in reverse, then you can increase this figure.

USE FILTERED DOWN SAMPLING
Most of the digitizing boards simply ignore or skip pixels to reduce the image size. For example, to create a 320 x 240 image, every second pixel is ignored. This results in stair stepping (aliasing) effects. To reduce these effects, capture the movie at a larger size, then recompress and resize the movie using filtered down sampling. ConvertToMovie and MovieShop both offer this option.

SOUND

- Capture at 22 kHz. This provides best quality. Downsample to 11 kHz for best quality and smallest size for distribution.
- To adjust the sound track, you can export the sound file from Premiere as an AIFF file and then use Sound Edit or another sound editing program to adjust the sound. Then bring the sound back into Premiere.
- The MacRecorder does not accurately stay at 22 kHz during recording. Use MovieShop to resample the sound during compression.

CREATING QUICKTIME ANIMATIONS
PROMotion exports an animation to QuickTime. MovieWorks saves all of its animation in QuickTime format. MacroMind Director can save movies to QuickTime format, as well as play movies within an animation (you must have version 3.1 to do this. Also, if you are using hardware acceleration, get version 3.2 which fixes a problem in Director.)

3D PROGRAMS SUPPORT QUICKTIME
Many 3D programs now support QuickTime. Typestry from Pixer saves flying logos as a QuickTime movie. Infini-D can export a 3D animation to QuickTime. It also lets you use a QuickTime movie as a surface within an animation (so you can have a QuickTime movie playing within a television set.)

PLAYING MOVIES IN HYPERCARD
Both Apple and Claris have released XCMDs for playing QuickTime movies in HyperCard. The Apple XCMDs are on the Apple QuickTime Developer CD, while the Claris XCMDs are available as part of HyperCard (and were available as an upgrade to owners of HyperCard. These XCMDs are differentÃthe Apple XCMDs offer more sophisticated functions, but are not officially supported. You must license either set to distribute with your HyperCard stacks.

USE JPEG COMPRESSOR TO STORE MOVIES
Movie size can be reduced drastically by recompressing using the JPEG compressor. However, the movie does not play well when compressed using JPEG.

Portable StyleWriter: How to charge the batteries

Is there a special method for charging the Portable StyleWriter battery? Putting it into the Portable StyleWriter battery compartment and connecting the printer to the AC adapter does not seem to charge it no matter how long I leave it plugged in.
This article has been archived and is no longer updated by Apple.
Follow these steps to place the Portable StyleWriter into battery charging mode:

1. Ensure that the power adapter is plugged into a wall outlet and into the printer.
2. Check that the battery switch is in the "1" position (versus the "0" position) on the back of the printer.
3. Turn on the printer with the Power button while holding down the On Line button.
4. When the first beep sounds, release the Power button.
5. When the second beep sounds, release the On Line button.

The POWER LED begins flashing, indicating that the printer has entered the battery charging mode.

The battery charging voltage is 14.8 V DC. The printer controller checks the battery voltage every 2 minutes during the charging process, which normally takes about 10 hours. When the charging is complete the printer automatically stops charging and turns itself off. If the battery voltage is less than 6 V DC at any time during the charging process, the battery is either over-discharged or defective, at which time the controller alternately flashes the POWER and ERROR LEDs to indicate a charging problem. The POWER LED flashes when the battery needs recharging.

Multimedia Glossary: A - F (1 of 3)

This article contains definitions of multimedia terms. For additional terms, see the following articles:

Article 16537: "**Multimedia Glossary: G - R (2 of 3)**"
Article 16538: "**Multimedia Glossary: S - Z (3 of 3)**"
This article has been archived and is no longer updated by Apple.

A/B roll editing
Editing from two source VCRs to a third VCR. This allows for transition effects like dissolves from one source tape to another.

Aliasing
A term used to describe the unpleasant jaggy appearance of unfiltered angled lines. Aliasing is the "beating" effects caused by sampling frequencies being too low to faithfully reproduce an image. There are several types of aliasing that can affect a video image which include temporal aliasing (for example, wagon wheel spokes apparently reversing) and raster scan aliasing (for example, flickering effects on sharp horizontal lines).

Analog Video
A video signal that represents an infinite number of smooth gradations between given video levels. By contrast, a digital video signal assigns a number for each level. The Macintosh video board converts computer-created (or digital) video to an analog signal for output to a monitor.

Analog Recording
The common form of magnetic recording where the recorded wave-form signal maintains the shape of the original wave-form signal. An example of this is a video tape.

Animatic
A limited animation used to work out film or video sequences. It consists of artwork shot on film or videotape and edited to serve as an on screen storyboard. Animatics are often used to plan out film sequences without incurring the expense of the actual shoot.

ANSI
Acronym for American National Standards Institute, which sets standards for many technical fields.

Anti-aliasing
Anti-aliasing is the manipulation of the edges of an image, graphic or text, to make them appear smoother to the eye. On close inspection, anti-aliased edges appear blurred, but at normal viewing distance, the apparent smoothing is dramatic. Anti-aliasing is important when working with high quality graphics for television use. See aliasing.

Aspect Ratio
The ratio of an image's width to its height. For example, a standard video display has an aspect ratio of 4:3.

Assemble Editing
Adding new material to the end of a previously recorded portion of a videotape that involves writing a completely new signal (including the control track) onto the tape. Performing an assemble edit in the middle of an existing program will introduce an undesirable glitch on the tape caused by an abrupt change in the sync information of the video signal. Compare insert editing.

Asynchronous
Not synchronized by a mutual timing signal or clock. Compare synchronous.

Audio Effects Board
The audio effects board is like the switcher, and acts as the main router and mixer for source audio. Here audio levels are adjusted, mixed, and filtered. Usually audio effects are kept to a basic level in a video editing session. More complex audio work is usually performed with a digital audio workstation.

Authoring System
Software that helps developers design interactive applications, titles, or courseware more easily than with conventional programming language

Auto-assemble
If all the editing decisions are made off-line, and the EDL is loaded into the CMX the actual editing is automatic, executing one event after another. This is called auto-assemble mode. During auto-assembly, the editor monitors video and audio levels, but does not need to control each edit. Loading the EDL into the CMS is typically done manually, however, some Macintosh programs can create CMX disks. The EDL generated by computer based editing systems like the Digital F/X and Avid Media Composer are usually perfectly accurate, therefore, they make auto-assembly a breeze since the opportunity for errors in entering the EDL by hand are eliminated.

Backtiming
Method of calculating the in point by subtracting the edit duration from the known outpoint.

Badge
A symbol in the corner of a QuickTime movie window which is pressed to bring the standard QuickTime movie controller into view.

Bandwidth
The frequency range of a video signal, measured in MHz. The bandwidth is directly related to horizontal resolutionÃthe higher number of picture elements defined, the higher the frequency required. The bandwidth describes "how much" information is being transferred. The bandwidth of the Macintosh II video signal can be as high as 33 MHz depending on screen size. By comparison, the bandwidth of broadcast television is 4 MHz High resolution images can be displayed on low resolution monitors, with an obvious loss in quality.

Black Level
The level of the video signal that corresponds to the maximum limits of the black areas of the picture.

Black, Black Burst
In video production, black refers to a composite video signal which has composite sync, reference burst, and a black video signal. Used for genlock purposes.

Blanking
The portion of the video signal that is off, or black, during the retrace interval of the scan. Blanking occurs between each horizontal line and during the vertical retrace between each field.

Blanking is important in broadcast production situations since there are strict FCC rules defining the blanking periods. Not all video products for the Macintosh conform to this aspect of the NTSC broadcast standard. Discuss this issue with vendors if broadcast quality is required.

Related to composite sync, this signal has both horizontal and vertical components and is at its negative level whenever video is to be blanked or turned off.

Blanking Level
The level of a video signal that separates the range that contains the picture information from the range that contains the synchronizing information. The level of the front and back porches is 0 IRE units.

BNC Connector
A connector typically used with professional video equipment for connecting cables that carry the video signal. Compare RCA connector and XLR connector.

Brightness

1. The luminance of the video signal, or the level of brightness on the scale from black to maximum white. One of the three determinants (with hue and saturation) of the color of an image, and the only one of the three that affects a monochrome image.
2. The brightness of a monitor or video projector measured in lumens. See luminance.

Broadcast Quality
An NTSC composite video signal conforming to FCC rules concerning signal properties like video and sync levels, timing and blanking. Devices providing NTSC signals do not necessarily meet FCC broadcast standards. This is important if the video signal or videotape being recorded is going to be used in a broadcast situation.

Bump-up
Making a copy from one recording medium onto a second medium which is more suitable for post-production purposes due to it's higher bandwidth and/or timecode capability. For example, material shot on Hi8 is usually "bumped-up" to 3/4-inch SP or Betacam SP for editing purposes since these formats feature higher resolution, less generation loss, a more robust tape, timecode, better frame-accuracy and faster shuttle speeds.

CAV
Acronym for Component Analog Video.

CCITT
Abbreviation for Consultative Committee on International Telegraphy and Telephony; an international committee that sets standards and makes recommendations for international communication.

CG
Acronym for Character Generator.

CGI
Acronym for Computer Graphic Imagery.

Character Generator
A character generator (CG) is a video device found in on-line editing suites used for titles and credits. A CG is simply a high-end word processor for video with a wide variety of fonts and sizes available. The most common character generator is the Chyron.

Chroma
The color information contained in a video signal, consisting of hue (phase angle) and saturation (amplitude of the color subcarrier).

Chroma Keying
The process of overlaying one video signal over another, the areas of overlay being defined by a specific range of chrominance. For this process to work, the chrominance must have sufficient resolution, or bandwidth. Composite video does not have sufficient bandwidth for acceptable quality chroma keying, therefore analog chroma keyers typically use component sources.

Chrominance
The color part of a signal, relating to the hue and saturation but not to the luminance (brightness) of the signal. Any colored signal has both chrominance and luminance.

Clean List (Clean EDL)
An EDL which does not contain any overlapping or redundant edits. Typically during the off-line editing process changes are made which result in edits that overlap or become redundant. Most computer-based editing systems can clean an EDL automatically. Compare dirty list.

Clip
Small QuickTime Movie. Also used to mean a segment of a larger movie, defined by an in point and an outpoint, usually containing a single scene or take.

Clipping
The process of cutting off the peaks of either the white or the black portions of a video signal.

CMX
The most commonly used editing computer. The EDL is loaded into it and it executes the edits and effects by controlling all of the required video machines. Actually, it may not control all of them. Certain operations may need to be done manually. Most editing computers use the CMX language, which has become an industry standard.

Color Bars
See NTSC color bars.

Color Burst
A portion of the composite video signal used for decoding its color information. Burst is several cycles of 3.58 MHz pulses recorded during the horizontal blanking interval and used to establish phase relationships for determining the hue. The color oscillator of a color television receiver is phase locked to the color burst.

Color Correction
A process in which the coloring in a video image is altered by electronic means.

Color Subcarrier
The 3.58 MHz signal which carries color information. This signal is superimposed on the luminance level. Amplitude of the color sub-carrier represents saturation and phase angle represents hue.

Compelling Conveyance
To use appropriate content and data type to communicate with maximum impact on an audience.

Component Video
A term given to a recording system which does not require NTSC encoding of RGB signals, but uses a means of recording and routing the luminance and color signals separately. This method does not reduce bandwidth nor compromise the RGB components and results in images of higher resolution and better color quality than composite video. Though designed for high end television production, similar recording methods have recently become available to the consumer market. See S-VHS and Hi8. Compare composite video.

Composite Blanking
See blanking.

Composite Sync
A signal consisting of horizontal sync pulses, vertical sync pulses, and equalizing pulses only, with a no-signal reference level.

Composite Video
A composite video signal is one in which the luminance, chrominance and sync information have been combined into a single signal using one of the coding standards: NTSC, PAL, SECAM, and so forth. This is the form the signal must take before it can be broadcast or recorded by standard

means. Until recently, most monitors and projectors have accepted only composite video signals, although many now available accept RGB. See NTSC. Compare component video.

Compositing
Combining two or more video or electronic images into a single frame or display.

Conforming
The process of doing the final editing of a video using an off-line edited master as a guide.

Continuous Branching
A program that enables the user to modify the presentation at any point rather than at specific branch points.

Contrast
The range of light and dark values in a picture or the ratio between the maximum and the minimum brightness values.

Controller
Portion of the QuickTime Movie Playback window with which you interactively control the direction and rate of playback.

Control Track
The portion along the length of a video tape on which sync control information is placed and used to control the playback of the video signal.

Control Track Editing
Editing videotape with equipment that reads the control track information in order to synchronize the editing between two decks. Frame accuracy is not certain as the VTRs can go slightly out of sync during pre-roll. Compare time
code editing.

control-L
See LANC.

Convergence

1. The beam-position accuracy of the red, green, and blue beams of a color monitor or projector. Color systems require exact accuracy of beams, both for position and speed, to properly produce the desired colors from their phosphors.
2. The adjustment of the red, green, and blue electron beams in a monitor or video projector to align the red, green and blue images.

Cross Color
A defect characteristic of NTSC composite video that manifests itself as spurious rainbow patterns on highly textured objects like the one found on a striped shirt or tweed jacket. Cross-color defect is attributed to the make-up of the signal which mixes the high luminance and chrominance information in the same composite baseband spectrum. Johnny Carson used to wear ties with designs specifically designed to create this effect.

Cross Luminance
A defect characteristic of NTSC composite video that appears as a dot pattern crawling up or hanging on the edges of color areas. This is a result of the signal structure where the color information leaks into the luminance signal. Also referred to as dot crawl.

Decoder
A device used to recover the component signals from a composite (encoded) source. Decoders are used in displays and in various processing hardware where component signals are required from a composite source.

Delay Line
A device designed to delay the video signal for a specific length of time. Required when switching between different types of devices or cameras with significantly different cable lengths.

Demodulate
To recover the information being transmitted by a modulated signal. For example, a conventional TV receiver demodulates an incoming broadcast signal to convert it into the luminance and chrominance information displayed by the CRT and the sound emitted by the speaker. Compare modulate.

Demodulator
A device which strip the video and audio signals from the carrier frequency.

Desktop Viewing
The ability to use the computer screen to view the output of a project of in interpersonal and corporate communication.

Dessimation

The loss of lines of data in a movie window as the size of the frame is reduced. Lack of data for certain lines causes undesirable artifacts during movie playback.

Device Interface
A converter box which separates the RGB and sync signals in order to display computer graphics on an RGB video monitor. Vendors include Covid and Extron.

Differential gain (DG) and differential phase (DP)
The distortion characteristics of the chrominance signal expressed as a numerical value which indicates to what degree the amplitude (differential gain as a percentage) and phase (differential phase in degrees) are distorted from the beginning and end of one horizontal scanning line.

Digital Audio Workstations
Computer-based systems for editing and manipulating digital audio. The audio can be synchronized with video for video post-production applications. Some common systems based on the Macintosh include Dyaxis, Pro Tools, Synclavier, and Dawn.

Digital Disk Recorder
A recorder much like a videotape recorder which uses large digital disk memories instead of tape. They can record and play back in single frame steps (with no pre-roll, since there is no tape involved), at variable speeds or at 30 fps. Digital disk recorders are available as both component and composite machines. Very, very, expensive.

Digital disk recorders can usually mix an incoming video signal with a stored one and record the net result simultaneously. Since everything is digital, this mix can be performed repeatedly, producing layer upon layer of moving images.

Digital Video
A video signal represented by binary numbers describing a finite set of colors and luminance levels. In accordance with "CCIR 601," the international digital video standard for sampling, the conversion from analog to digital suffers virtually no loss.

With current technology, the cost of using digital video to represent the range of levels and colors easily handled by analog videotape is prohibitive. Digital video requires more bandwidth than analog video to produce the same results, unless fancy compression techniques are used. As digital memory capacity and processing speeds become more economical, digital video will eclipse analog video. Standards such as QuickTime, DVI, MPEG, and JPEG for video make digital manipulation of video information possible on today's personal computers.
Note: consumer "digital" televisions and camcorders use the term to refer to the use of digital frame buffers for effects or signal processing. The output of these buffers is still converted back into analog signals for display and storage.

Digital Video Effects (DVEs)
A real-time frame buffer that can zoom in and out, reposition, and freeze frame in real time. Some can also warp video frames into trapezoids, cylinders, and spheres to create a variety of special effects. Common trade names include ADO, Encore, Mirage, and Pinnacle.

DIN
Acronym for Deutsche Industrie Normal, a European standards organization.

Dirty List (Dirty EDL)
An EDL containing overlapping or redundant edits. See and compare clean list.

Dither Pattern
The matrix of color or gray-scale values used to represent colors gray shades in a display system with a limited color palette.

Dithering
A technique for alternating the values of adjacent dots or pixels to create the effect of intermediate values. In printing color or displaying color on a computer screen, the technique of making adjacent dots or pixels different colors to give the illusion of a third color. For example, a printed field of alternating cyan and yellow dots appears to be green. Dithering can give the effect of shades of gray on a black-and-white display, or more colors on a color display.

Dot Crawl
See cross luminance.

Dot Pitch
A measure of the distance between dots on the screen. The closer the dots, the sharper and clearer the image.

Dot Space
The horizontal distance between dot centers. This distance depends on the character pitch in effect.

Drop-out
Missing information from magnetic tape caused by dust, lack of oxide, and so forth. Especially noticeable with a format such as Hi8 which packs a tremendous amount of information onto a tiny and fragile tape.

Dubbing
Making a copy from one recording medium to another. See bump-up.

Duration
The length or persistence of a signal in time. Compare frequency.

Dynamic Tracking
The ability for a video head to "bend" back and forth enough to find an adjacent track and follow it. This allows true freeze-frame rather than only freeze-field display. It also allows for variable speed playback, including playing in reverse, which otherwise is not possible.

EBU
European Broadcasting Union.

Edit Decision Lists (EDL)
The Edit Decision List, or EDL, is the data controlling the editing computer during an on-line session. It lists "in-points" and "out-points" for both the source playback decks and the record deck. These "events" can be for video, audio, or both. The EDL may control all sources, various effects machines (for fades and dissolves, for example) and the record deck. An EDL may be created manually after the off-line editing is complete or it may be generated by the edit controller used in more sophisticated off-line systems. Computer based editing systems including the Digital F/X and Avid Media Composer will automatically generate an EDL. See off-line, on-line.

Effects
Effects involve any manipulation or processing of the video or audio signal. Though they are often used for gratuitous gimmickry, they can also be used for valid functional and aesthetic design purposes. Video effects seem to change annually, and are heavily technology-driven. Since they sometimes cannot be simulated in an off-line environment, the best way to prepare to use them is to look over the free demos available from various video facilities and vendors. Off-line systems like the Avid Media Composer allow you to preview most of the standard video effects.

EIA
Electronic Industries Association. The organization which determines recommended audio and video standards in the United States.

EIA sync
see RS-170.

Encoded video
The encoded video signal is formed by starting with an RGB signal from the color television camera. This RGB signal is then processed through an encoder, known as the I and Q encoder, which converts the RGB into a composite NTSC signal. The encoded signal has all of the elements of the composite video signal: sync, burst, chroma, and luminance.

Encoder
A device which transforms NTSC timed red, green and blue signals into a single NTSC composite signal combining luminance, chrominance, and sync information. Compare decoder.

ENG
Acronym for Electronic News Gathering.

Equalizer

1. Equipment designed to compensate for loss and delay frequency effects within a system.
2. A component, or circuit, which allows for the adjustment of a signal across a given band

FCC
Federal Communications Commission. A federal bureau that regulates radio and television broadcast standards. FCC regulations carry the force of law.

Field
One complete vertical scan of the picture, containing 262.5 lines. Two fields make up a complete television frame; the lines of field 1 are vertically interlaced with field 2 for 525 lines of resolution in the NTSC standard.
In many respects, a video signal is best conceptualized as 60 separate images per second. When video is recorded from a video camera, each field represents an independent sample of time. This becomes apparent when video-originated material on a videodisc is still framed, one may see flutter: two different images shot 1/60 of a second apart from each other on the same screen.

Film
While videotape is simple in structure but requires complex machines for recording, film is complex in structure but requires simple recording machines. Film cameras are simple and elegant machines, and when you think about it, the film itself is the recorder.

Film is often used in the production of video for a variety of reasons, including the high image quality of film transferred to video and the ability to record film at any frame rate the camera allows. There are no technical requirements for a particular frame rate as there are with video, each film frame is simply exposed to light, then advanced. Many film cameras have variable frame-rate capabilities--a concept totally foreign to video.

Film Chain
A device used to transfer film to video. They are still used by some TV stations to broadcast programming distributed on 16 mm film. See telecine.

First Generation
The first time the signal is recorded on tape, that tape is called a first generation tape. Each time the tape is dubbed, a generation is added. See generation loss.

Fotovix
The brand-name of a device available from Tamron which provides a relatively inexpensive way to transfer still 35 mm film slides and negatives to video.

Frame
The total area of the picture which is scanned while the picture signal is not blanked. A complete NTSC TV picture consisting of two fields; a total scanning of all 525 lines of the raster area; occurs every 1/30 of a second. In other countries where PAL and SECAM are the video standard, a frame consists of 625 lines at 25 frame/sec.

Frame Grabber
A device allowing the real time capture of a single frame of video in a temporary buffer for manipulation or conversion to selected computer file formats. Some frame grabbers have buffers large enough to store several complete frames, allowing rapid capture of a number of images. The distinction between a frame grabber and a digitizer is that a digitizer captures a sequence of complete frames, and therefore must employ some form of compression and/or acceleration in order to operate in real-time.

Frames
NTSC video plays at 30 frames per second, and each video frame consists of two half-frames called fields. A field consists of every other horizontal line. When the video image is created on a TV set, the little scanning dot of light first scans across the topmost horizontal line, line 1. Rather than scanning along line 2 next, it scans line 3, then line 5, and so on. When it gets to the bottom (in half of the 1/30 second frame time), it begins at the top again but on line 2, then line 4, and so on. This technique is called interlace, and it was invented because most people see a flickering image if television is scanned sequentially at 30 fps.

Frequency
The number of complete cycles transmitted per second. Frequency is usually expressed in hertz (cycles per second), kilohertz (kilocycles per second), or megahertz (megacycles per second). In acoustics, frequency of vibration determines musical pitch. Compare duration.

Article 16538: "**Multimedia Glossary: S - Z (3 of 3)**"
This article has been archived and is no longer updated by Apple.

Gamut

The range of voltages allowed for a video signal, or a component of a video signal. Signal voltages outside of the range (exceeding the gamut) may lead to clipping, crosstalk, or other distortions.

Gate Weave

An artifact of poor registration either during the film-to-tape transfer process or the actual filming that manifests itself as a weaving back and forth of the film image. See registration.

GBR

The same signals as RGB. The sequence is often rearranged to indicate the mechanical sequence of the connectors in the SMPTE standard.

Generation Loss

With analog video formats extensive efforts are made to keep generations to a minimum since each successive generation will exhibit some loss of image quality in the form of noise and other artifacts. This characteristic varies from format to format. For example, 1-inch Type C exhibits almost imperceptible loss up to 4 generations while VHS shows considerable degradation each generation. With digital formats such as D-1 and D-2, however, this requirement is no longer necessary, since each copy can potentially be very close to perfect. This is important for applications such as compositing which require images to be dubbed several times.

Generations

The number of times a video clip is copied or processed. See generation loss.

Genlock

The capability to synchronize video signals from one device with those of another video source. This is required when mixing signals together as in overlaying computer graphics on an image from a camera, VCR or videodisc player to prevent screen flicker or rolling.

Genlocking a Macintosh requires changing its video scan rate, switching the video into an NTSC timed interlaced image which can then be synchronized with the other video source. This requires either an encoder box attached to a video card which supports genlock or a scan converter.

Genlock is a process of sync generator locking. This is usually performed by introducing a composite video signal from a master source to the subject sync generator. The generator to be locked has circuits to isolate vertical drive, horizontal drive and subcarrier. The process then involves locking the subject sync generator to the master subcarrier, horizontal, and vertical drives so that the result is that both sync generators are running at the same frequency and phase.

Ghost

A shadowy or weak image in the received picture, offset either to the right or to the left of the primary image. It is the result of transmission conditions where secondary signals are created and received earlier or later than the primary signal caused by a reflected RF signal.

Gray Scale

A series of tones which range from true black to true white, it is usually expressed in ten steps in video applications.

HDTV

High Definition Television. Still, limited to some very high-end applications. The FCC is close to establishing a broadcast standard for HDTV. The SMPTE has proposed a high definition television production standard consisting of 1125 lines, 2:1 interlace, 60 Hz field (30 frames/sec), a 16:9 aspect ratio and 30 MHz RGB and luminance bandwidth.

Hertz (Hz)

The unit of frequency of vibration or oscillation, defined as the number of cycles per second. Named for the physicist Heinrich Hertz.

Horizontal Blanking

The blanking signal that is produced at the end of each scanning line.

Horizontal Blanking Interval

The time between the display of the rightmost pixel on one line and the leftmost pixel on the next line.

Horizontal Drive

See horizontal sync.

Horizontal Resolution

The smallest increment of a television picture that can be discerned in the horizontal plane. This increment is dependent upon the video bandwidth and is measured in frequency or lines.

Horizontal Scan Frequency

The frequency at which horizontal sync pulses start the horizontal retrace for each line. A high frequency is needed for a non-interlaced scan. The horizontal sync frequency for a color Macintosh connected to the 13-inch RGB display is 35 KHz, while the NTSC frequency is 15.75 KHz. Projection of high resolution non-interlaced Macintosh color video requires projectors capable of 35 KHz horizontal sync frequency.

Horizontal Sync

A signal created and used to synchronize the horizontal scan of a video signal, often combined with vertical sync into a composite sync. This signal is derived by dividing sub-carrier by 227.5 and then doing some pulse shaping. The signal is used by monitors and cameras to determine the start of each horizontal line. See horizontal scan frequency.

House Sync

A common sync signal generated by a sync generator and fed to all video devices in an editing facility in order to synchronize the devices. See sync.

Hue

(1) The distinction between colors. Red, blue, green, yellow, and so forth are hues. White, black, and gray are not considered hues. The dimension of color that is referred to a scale of perceptions ranging from red through yellow, green, blue back to red.

(2) The color tint of a video image. The color of an analog video signal is determined by three factors: hue, saturation and luminance. In a composite video signal, the hue is determined by the phase relationship to the color burst.

IEEE

The Institute of Electrical and Electronic Engineers, an organization which sets many of the standards in the electronic industry.

Interactivity

An open-loop control where a programmed system is directed by its user through mutual and simultaneously activity where either can interrupt the other without crashing the operation, where there is limited ability to anticipate, no default path and there is the impression of an infinite database.

In Point/Out Point

The first and last frames of a selected portion of a large clip. Frame notation (00:00:00:00= hours:minutes:seconds:frame) is the used to designate an in point and an out point.

Interlace

An NTSC 525 line frame which is separated into two sequential scans, or fields, of 262.5 lines each. Field one scans the odd numbered lines and field two scans the even numbered lines creating two interlaced images per frame. The process results in 60 fields per second and is used to reduce the flickering which is apparent when the eye is presented with 30 images per second. In standard video, odd-numbered lines are drawn first. Most computer displays are not interlaced.

IRE scale, IRE units

A unit used for the measurement of video levels. The scale used for the graticule on a waveform monitor. 140 IRE represents 1.000 V, 100 IRE represents 0.714 V, while 1 IRE represents 0.007 V.

ISO

Acronym for International Standards Organization.

Jitter

Small and rapid variations in a wave form due to mechanical disturbances, changes in the characteristics of components, supply voltages, imperfect synchronizing signals, circuits, and so forth.

Kelvin

Also expressed as Kelvin or K, the unit of measurement of the temperature of light In color recording, light temperature affects the color values of the lights and the scene that they illuminate.

Keying

The process of replacing part of one television image with video from another image. See chroma keying and insert keying.

Kilohertz (KHz)

One thousand hertz, or cycles per second. See Hertz.

LANC

A protocol defined by Sony which permits the external control of video devices and access to status information from the device. Also referred to as Control-L. See VISCA, Vbox.

Legal Signal

A video signal in which each component does not exceed the specified gamut for the given format. Compare valid signal.

Light Valve Projector

A video projector design with very high light output. An example of a projector using this technology is the Talaria from General Electric.

Longitudinal Time Code (LTC)

Longitudinal time code (LTC) is recorded as an audio signal on the address track or one of the audio tracks of a video tape. It may also be recorded on a track of audio tape. LTC can be read at high tape shuttle speeds, allowing time code readers to stay "in-sync" during rewind or fast forward. Unfortunately, LTC cannot be read at very slow shuttle speeds (such as when you are "crawling" the tape frame by frame) or in pause. See SMPTE time code, compare vertical interval time code.

Looping

A term indicating that a high impedance device has been permanently connected in parallel to a video source.

LTC

See longitudinal time code.

Luminance

The aspect of the video signal carrying information about the brightness of an image.

Macintosh Video

Typically refers to the signal produced by a Macintosh 824 display card or Quadra built-in video. Although several scan rates and resolutions are supported, when connected to the 13-inch RGB monitor the display resolution is 640 by 480 pixels with a 67.7 Hz scan rate.

Matte

1. A film term sometimes used in video production work to denote a keyed effect, an insert of video signal information keyed from one source into a second video signal.
2. A opaque piece of art or a model that leaves a selected area unexposed to be filled on a subsequent pass or in composite. Also referred to as a mask.

Mavica

The name-brand of a popular still video camera sold by Sony, See still video cameras.

Megahertz (MHz)

One million hertz, or cycles per second. See Hertz.

Metal Particle Tape

Videotape using iron in its pure metallic form, instead of as an oxide. Offers improved frequency response and wider dynamic range than traditional oxide formulations.

MIDI

Acronym for Musical Instrument Digital Interface. A standard communications protocol used by electronic music equipment allowing device control from personal computers. MIDI has moved into the audio and video realm for mixing and editing.

MIDI Time Code

A time code system allowing timed device control through MIDI protocols. It has become more important in video post production as more and more people are working with personal computer based systems. Compare SMPTE time code.

Modulate

To modify or alter a signal so as to transmit information. For example, conventional broadcast television transmits the video image by modulating the amplitude and frequency of a carrier signal. Compare demodulate.

Moire

Optical disturbance caused by interference of similar frequencies. The wavy effect produced by the convergence of lines. It usually appears as a curving of the lines in the horizontal wedges of a test pattern. It is a natural optical effect when converging lines in a television picture are nearly parallel to the scanning lines. Compare aliasing.

Monitor

A particular type of television that receives a composite and/or component video signal (as opposed to an RF signal) directly from a VCR, camera, or separate TV tuner for high quality picture reproduction. Does not contain a channel selector. Compare television receiver.

Monochrome Signal

A single color video signal; usually a black and white signal or, sometimes, the luminance portion of a composite or component color signal.

Motion Control Photography

A system for using computers to precisely control camera movements so that different elements of a shot can later be composited in a natural and believable way.

Movie

Movie (in QuickTime) refers to all dynamic data, such as sound, video and animation. The QuickTime movie file format is a container for this timebased data

Multiscan

A term taken by a particular manufacturer often used to refer to any multisync device. See multisync.

Multisync Monitors (and Projectors)

Video displays which accept a wide variety of horizontal and vertical timings, from NTSC to computer video signals. Multisync monitors and projectors will often automatically adjust to the appropriate timing. Since the horizontal frequency range varies among different models, product specifications should be checked to assure a monitor or projector will support the Macintosh connected to it. Multisync monitors manufactured by Apple are called Mulitple Scan Displays.

Neutral Colors

The range of gray levels, from black to white, but without color. For neutral areas in the image the RGB signals will all be equal, in color difference formats the color difference signals will be zero.

NTSC

1. Abbreviation for National Television Standards Committee, which standardized the NTSC color broadcasting system which is used today in the in the US, Japan and elsewhere.
2. The standard video format defined by the NTSC, also called composite because it combines all the video information, including color, into a single signal. See NTSC composite.

NTSC Color Bars

A pattern generated by an NTSC generator consisting of eight equal width color bars. Colors are white (75 percent), black (7.5 percent set-up level), 75 percent saturated pure colors red, green, and blue, and 75 percent saturated hues of yellow, cyan, and magenta. (Mixtures of two colors in 1:1 ratio without third color).

NTSC Composite

A video signal standard proposed by the National Television Standards Committee of the Electronics Industries Association and adopted by the FCC for broadcast television in the United States. The signal is a composite video signal of 525 lines, interlaced, 60 fields per second (30 frames per second) with a bandwidth limited to 4 MHz so that it will fit into a 6 MHz broadcast television channel without interfering with adjacent channels. NTSC is also the standard system for Japan.

The standard was created to allow color television signals to be compatible with existing monochrome (black and white) television. The restriction of compatibility with the earlier technology results in compromises in color image quality. The NTSC composite signal format is required for video recording except with devices which support component video.

Though there are 525 scan lines, more than 40 lines are blanked during vertical retrace periods. Overscanning and poorly adjusted televisions reduce the number of visible lines further, leaving viewers around 360 lines of video information in a normal television picture.

Macintosh video can be converted to NTSC composite using an encoder or scan converter. When using an encoder with a Macintosh video card there is an unavoidable reduction in image quality and single pixel lines, for instance, will flicker (unless the video card supports convolution) due to the interlaced nature of the NTSC signal. Images intended for NTSC use should be designed according to the limitations of the format, unless a more expensive scan converter is being used. See encoder and scan converter.

NTSC RGB

Interlaced red, green, and blue video signals timed to NTSC standards. Refers to three monochrome signals representing the primary colors of the image. This is a superior signal format to composite video which is one signal encoded from the three signals. An NTSC RGB signal differs from a component video signal which consists of Y, R-Y, and B-Y signals.

Off-line, Off-line Editing

The preliminary or rough edit usually done on a low-cost editing system using videocassette work tapes. In an increasing number of situations random-access non-linear editing system using digitized video or laserdiscs are being used for off-line editing. Allows editors to make decisions and gain necessary approvals before making the more expensive and demanding on-line edit.

Since the actual edit session in a professional video facility is very expensive, it is always best to make all editing decisions in advance. This is called off-line editing or off-lining. See window dubs, on-line, special effects.

On-line, On-line Editing

The final edit of a video using original master tapes to produce the finished piece. An on-line edit suite usually has a full range of high-end video devices (switcher, TBCs, DVE, character generator, and so forth) which would normally be too expensive to use during an off-line edit session.

The on-line session is where the actual editing and effects take place. It occurs in an edit suite with a professional editor (known as the on-line editor). Again, the more prepared you are, the better since "things happen." It is very easy to go way over your budget estimate for an off-line edit

if your EDL contains little surprises like a mislabeled in-point. Computer based editing systems like the Digital F/X and Avid Media Composer automatically generate EDLs which are very accurate, reducing on-line time considerably. See CMX, special effects, window-dubs. Compare off-line.

Opticals

Visual effects produced optically using an optical printer that contains one camera head and several projectors. The projectors are precisely aligned in order to produce multiple exposures in exact registration on the film in the camera head. Rapidly being replaced with special high-resolution video devices for all but feature applications.

Overscan

1. The television picture beyond area of normal screen size.
2. A method by which the video image is scanned beyond the normal viewing area of the screen. Compare underscan.

Paintbox

Paintbox is the trade name for a device made by Quantel, however, it is geneneally used to describe a digital video paint program capable of drawing and shading images from scratch or from digitized video frames. The Paintbox creates only still images, but sequences of animated images can be made from the still images by loading frame by frame onto a Harry or equivalent.

PAL

Phase Alternative Line system. The television broadcast standard for most of western Europe. Based on the 50 Hz power system, it displays 625 lines interlaced at 50 fields per second (25 frames per second). By reversing the relative phase of the color signal components on alternate scanning lines, this system avoids the color distortion that appears in NTSC reception. PAL is not compatible with NTSC or SECAM, though conversion between the standards is possible. Video products to be used in Europe require compatibility with PAL standards.

Pedestal

See blanking level.

Period

The time elapsed during one complete cycle of a wave.

Phase

1. A stage in a periodic process; a point in a cycle.
2. The relationship between two periodic signals or processes.
3. The amount by which the cycles of one wave precede or lag behind the cycles of another wave of the same frequency.
4. Some fraction of a wave cycle (measured from a fixed point on the wave).

Posters

A single frame of a QuickTime movie that is designated as a static substitute for the movie's video data. The poster is typically the frame that would be printed if a movie was pasted into a document.

Pre-roll

Almost all videotape decks need a running start to get up to speed. This is called pre-roll, and varies between machines from about 3 to 10 seconds. This means that for every edit, source and record decks must first stop, count backward the exact number of frames required for pre-roll, begin playing simultaneously, then at the precise edit point begin recording. It is a mechanical and electronic marvel that video editing can be frame-accurate at all. See sync.

Primary Colors

Colors, usually three, which are combined to produce the full range of other colors within the limits of a color system. All non-primary colors are mixtures of two or more of the primary colors. In television, the primary colors are a specific set of red, green and blue.

Pulse

A current or voltage which changes abruptly from one value to another and back to the original value in a finite length of time. Used to describe one particular variation in a series of wave motions.

Pulse Distribution Amplifier

An amplifier designed to boost the strength of the sync as well as other control signals to the proper level for distribution to a number of cameras, special effects generators, or other equipment.

QuickTime

An operating system software extension for dynamic media such as sound, video and animation for Macintosh computers. The QuickTime standard file format is a "movie". QuickTime is also available for MS Window computers and FM-Towns (in Japan).

Radio-Frequency (RF) Modulator

A device that makes your television set work as a monitor. See modulator.

Rank

The brand-name of a device used for film-to-video transfer. See telecine.

Raster

The rectangular, repeating pattern of lines scanned in a video monitor or camera pickup tube creating the video image. The scan is a continuous cycle regardless of the image content.

RCA Connector

A connector typically used for audio and video signals, with some professional equipment and most consumer equipment. Compare BNC connector, XLR connector.

Registration

1. An adjustment associated with color monitors and projectors to ensure that the three electron beams (the three primary colors) are hitting the proper color dots/stripes on the phosphor screen, A similar adjustment exists on color tube cameras.
2. The alignment of film frame-by-frame in a camera, projector or telecine. Good registration is critical in order to eliminate gate weave. See gate-weave.

Resolution

A measure that shows to what extent details can be distinguished on the TV screen. Generally called horizontal resolution when referring to a video image. It can be evaluated by establishing the limit to which lines can be distinguished on a test pattern with the naked eye. A broader frequency band of the video signal permits a higher resolution.

Macintosh video has a bandwidth of 30 MHz, resolving color images at 640 pixels by 480 pixels. This exceeds the capabilities of an NTSC composite signal.

RF

Radio Frequency refers to a composite video signal superimposed on a very high (radio) frequency capable of being broadcast through the atmosphere. Standard television sets receive these signals, separate the composite signal from the RF, and then decode and display the composite signal.

Until recently, television sets were designed to receive only RF signals, which were applied to their antenna terminals. VCRs, videodisc players and some computers provide RF signals for use with televisions. The process of mixing composite video with RF, only to have it removed again by the television, further degrades the image quality.

RGB

Red, Green, Blue. Refers to three monochrome signals representing the primary colors of the image. RGB signals are provided on individual outputs with composite sync available either on a fourth output or combined with the green signal. RGB signals can be interlaced (timed to NTSC standards) or non interlaced (at higher sync frequencies).

RGB Monitor

A type of color monitor that receives separate signals for each color (red, green, and blue). See also composite video.

RGB, RGB Format, RGB System

Red, Green, and Blue. The basic parallel component set, in which a signal is used for each primary color; or the related equipment or interconnect formats or standards. The same signals may also be called GBR as a reminder of the mechanical sequence of connections in the SMPTE interconnect standard. See RGB component. Compare component video.

Rise Time

The time taken for a signal to make a transition from one state to another; usually measured between the 10% and 90% completion points of the transition. Shorter, or faster rise times require more bandwidth in a transmission channel.

Rotoscope

A camera set up that projects live-action film one frame at a time onto a surface so that an animator can trace complicated movements. The completed animation film exactly matches the motion of the original action.

RS-170

The EIA (Electronics Industries Association) standard that defines the timing of broadcast video in the United States, Japan, and several other markets. It specifies a 15.75 KHz horizontal and a 60 Hz vertical interlaced scan frequency as well as other aspects of the composite signal such as voltage, sync levels and timing of blanking.

Interlacing is the process by which two fields, called scan lines, are interleaved on the screen. Due to the limitations of video devices at the time the standard was being set in 1957, the speed of broadcast signals and picture tubes required the image to be displayed in parts.

The solution allowed the partial update of video pictures to remain unnoticed to the viewer. An RS-170 video frame contains 525 lines and is displayed 60 times per second for a total of 15Â 750 lines, or 15.75 KHz. Of these lines, only the odd or even lines are displayed with each frame. A total of 60 frames per second allows 30 frames per second, or a 30 Hz update of each line.

Like the RS-343 standard, RS-170 is strictly a timing specification for monochrome video signals. By combining three such signals to control individual red, green, and blue sweep circuits, you can create a full-color system. The RS-170 mode is available with the Macintosh video card as a way for VCRs and large screen projectors, not capable of high-frequency scans, to interface with the Macintosh. Compare RS-343, RS-170A, RS-170 RGB.

RS-170A

Twenty years after the drafting of RS-170, the EIA video signal standard proposal RS-170A evolved into what is known today as the NTSC composite video signal. RS-170A specifies timing of scans (essentially the same as RS-170: 15.732 KHz horizontal and 59.94 Hz vertical) and blanking as well as the 3.58 MHz burst required to decode the color signals. As adopted by the FCC for broadcast use, the standards are precisely adhered to and carry the force of law. For non-broadcast use, EIA standards are merely recommendations and are not enforced. Specifications referring to RS-170A do not necessarily mean the signals are broadcast standard. RS-170 RGB, RS-170.

RS-170 RGB

Refers to RGB signals timed to RS-170 specifications. Since the red, green and blue signals are actually individual monochrome signals representing their respective colors, RS-170 RGB merely refers to three black and white signals sharing one sync signal which is either provided separately as a fourth signal or (usually) combined with the green signal. Compare RS-170A, RS-170.

RS-343

An EIA (Electronics Industries Association) standard for non-broadcast high resolution monochrome video, specifying a 60 Hz non-interlaced scan with a composite sync signal with timings that produce a non-interlace (progressive) scan at 675 to 1023 lines.

While the Macintosh version of the RS-343 signal varies somewhat, it essentially follows the guidelines necessary for connection to RS-343 display devices. Therefore, with a display adapter (available from Covid , Extron, or Inline) the Mac can drive a RS-343 device (i.e. video projector or large monitor).

The major differences between Macintosh video and the RS-343 standard are: a separate TTL level composite sync signal on pin 3, the separate video lines used to produce RGB color, a vertical scan rate of 66.67 Hz to reduce screen flicker, and a voltage white level of 1 volt for its red and blue signals and 1.3 volts on its green signal. RS-343 provides for a 60-Hz signal but has been changed to 66.67 Hz on the Macintosh video card to prevent the screen flicker which is visible at 60 Hz. The inclusion of the analog composite sync found on pin 5 of the video card connector, called the green signal, allows for monochrome composite video.

This article has been archived and is no longer updated by Apple.

S-Video

A consumer form of component video (Y/C) used primarily with Hi8 and S-VHS equipment.

Safe Title Area

80 percent of the TV screen, from the center of the screen; that area of the display screen (and therefore of the camera scanning area) which will reproduce legible title credits no matter how poorly adjusted the monitor or receiver may be.

SC Phase

The phase of the color subcarrier.

Scan Converter

A device that changes the scan rate of a video signal and may also convert it from non-interlaced to interlaced mode. A scan converter allows computer graphics to be recorded on videotape or displayed on a standard video monitor.

Scan Rate

The scan rate is the time it takes the electron gun to move across one line of the screen or repeat one entire screen. These values are known as the horizontal and vertical scan rates, respectively. The number of times a screen is redrawn each second. Computer display scan rates differ from standard video scan rates.

Scanning

The rapid movement of the election beam in a pickup device of a camera or in the CRT of a television receiver. It is formatted in a line-for-line manner across the photo sensitive surface which produces or reproduces the video picture.

SECAM

Systeme Couleur Avec Memoire. The television broadcast standard for France, Russia and various eastern European countries. Like PAL, SECAM is based on a 50 Hz power system, but it utilizes a different encoding process and displays 819 lines interlaced at 50 fields per second. The color information is transmitted sequentially (R-Y followed by B-Y, etc.) for each line and conveyed by a frequency modulated subcarrier that avoids the distortion arising during NTSC transmission. SECAM is not compatible with NTSC or PAL, although conversion between the standards is possible.

Serial Device Control

Most professional video equipment can be controlled via an RS-232 serial port. The protocols used for controlling these devices varies from vendor to vendor, however, Sony's protocol is supported by most editing systems.

Signal-to-noise Ratio (S/N)

An S/N ratio can be given for the luminance signal, chrominance signal, and audio signal. The S/N ratio is the ratio of noise to actual total signal, and it shows how much higher the signal level is than the level of noise. It is expressed in decibels (dB), and the bigger the value is, the more crisp and clear the picture and sound will be during playback.

SMPTE

Society of Motion Picture and Television Engineers, pronounced "simptee." An organization which studies and proposes standards for the film and television industry.

SMPTE Format, SMPTE Standard

In component video these terms refer to the SMPTE standards for parallel analog component video interconnection. The SMPTE has standardized both RGB and Y, Pr, Pb color difference systems (a version of Y, B-Y, R-Y).

SMPTE Timecode

A coding scheme standardized by the Society of Motion Picture and Television Engineers (SMPTE). Frame accuracy is achieved through timecode, a method of coding a unique "stamp" on each frame. Timecode consists of four numbers representing hours, minutes, seconds, and frames, for example, 23:59:59:29.

Since color video actually runs at 29.97 fps rather than 30 fps, two kinds of timecode have evolved: drop fame and non-drop frame. Drop-frame timecode literally drops certain agreed-upon numbers to compensate for the 0.03 fps discrepancy. Drop-frame timecode allows a 30:00:00:00 tape to really be 30 minutes long, which is critical in broadcast applications. For non-broadcast applications it tends to do nothing but create problems, and non-drop-frame timecode is usually preferred.

Most of the low-end videotape formats, like VHS and Video 8 do not have timecode. They can count frame pulses on the tape, but are not frame-accurate. Sony has introduced "8 mm timecode" in order to support more accurate editing applications with Hi8.

There are two basic techniques used to record SMPTE time code on videotape, see longitudinal time code (LTC) and vertical interval time code (VITC).

Snow

1. Random noise on the display screen, often resulting from dirty videotape heads.
2. TV signal breakup caused by weak or no video reception.

Sound Digitizer

A device for recording natural sounds and voices and storing them as computer files. Once digitized, the audio can be easily edited or used to create various effects. On the low-end there are products like the Farallon MacRecorder or Apple's built-in capability on some Macintosh models. With the AudioMedia card or Pro Tools interface from DigiDesign, CD-quality sound digitizing is possible with the Macintosh.

Split Screen

A special effect utilizing two or more video sources so that two or more scenes are visible simultaneously on each part of the screen. Often used to make window-dubs of multi-camera shoots.

A useful means for comparing two sources simultaneously. Permits a fast visual check of the phase and sync timing between two inputs.

Staircase

A pattern generated by the NTSC generator, consisting of equal width luminance steps of 0, +20, +40, +60, +80, and + 100 IEEE units and a constant amplitude chroma signal at color burst phase. Chroma amplitude is selectable at 20 IEEE units (low stairs) or 40 IEEE units (high stairs). The staircase pattern is useful for checking linearity of luminance and chroma gain, differential gain, and differential phase.

Standard, Interconnect Standard

The specific signal configuration, reference pulses, voltage levels, etc. which describe the input/output requirements for a particular type of equipment. Some standards have been established by professional groups or government bodies (such as SMPTE or EBU). Others are determined by equipment vendors.

Still Video Cameras

Still video cameras are cameras that look like something in-between a still and a video camera. The Sony Mavica records on a two-inch disk that holds 25 frames or 50 fields on flexible disks which are erasable and reusable. The encoding is analog component, but with less bandwidth (and therefore a noticeably lower quality image).

Electronic still photography has been used for "electronic journalism," where images are shot in the field and sent by modem from any available phone. These cameras have already begun to replace still picture film cameras for many applications which do not require the high resolution and image quality of 35 mm still picture film.

Storyboard

A series of panels of pictures (usually sketches) designed to show how a production will look. Comic books are essentially storyboards.

Sub-carrier

A 3.58 MHz signal modulated by color signals and combined with luminance signals to produce an NTSC composite video signal.

Subcarrier (SC, 3.58, 3.58CW)

This is the basic signal in all NTSC sync signals. It is a continuous sine wave, usually generated and distributed at 2 volts in amplitude, and having a frequency of 3.58 MHz. Subcarrier is usually divided down from a primary crystal running at 14.32 MHz, and that divided by 4 is 3.58. All other synchronizing signals are directly divided down from the subcarrier.

Subcarrier Phase Shifter

Special circuitry designed to control the phase relationships of the two portions of the encoded color signal so that they maintain their correct relationship during recording transmission and reproduction.

Switcher, Video Switcher

The switcher is the central router and mixer of video source material in an on-line suite. Switchers are generally analog devices, and are capable of performing analog effects as well as switching incoming channels. These effects include fades and dissolves, wipes and borders, and keys (opaque overlays based on replacing black or a particular color). In earlier days this was called the "special effects generator" or SEG.

Sync

(1) Short for synchronous. Refers to signals used to synchronize the horizontal and vertical scans of a video signal. This signal is derived from a composite or combination of horizontal and vertical drives, with some slightly narrowed and delayed pulses as well as the addition of equalizing pulses. When used, is usually accompanied by subcarrier.

Synchronization Of Video Tape Recorders

In order for any mixing or editing of video signals to occur, all source and record decks must be in sync with each other, running at exactly the same speed and in identical phase. You can picture the process as being similar to transferring goods between high-speed trains running alongside each other. In editing facilities, all decks are fed a common sync signal, called "house sync." See pre-roll.

Without synchronization, each individual transport would all run at slightly different rates. Analog tape transports, being mechanical, have small fluctuations in tape speed called "wow and flutter". The capstans on tape machines can slip over time as well, also generating changes in tape speed.

With disk-based systems there is no mechanical transport and no tape. Instead, the playback and record speeds are controlled by quartz crystal oscillators. However, no two oscillators are exactly the same, and an oscillator's frequency can vary with time and temperature. What all this means is that any two transports, even when started at exactly the same time, will begin to drift apart over time and the audio on the different systems will eventually drift out of sync.

Synchronization is achieved in these systems by constantly checking to see the current SMPTE frame, and adjusting the playback speed to keep all devices locked. In analog systems, this is achieved by automated motor speed control. In digital systems it is achieved by adjusting the playback sample rate. See sync, SMPTE time code.

Synchronous

Able to perform two or more processes at the same time, such as sending and receiving data, by means of a mutual timing signal or clock. Compare asynchronous.

Synchronous Transmission

A transmission process that uses a clocking signal to ensure an integral number of unit (time) intervals between any two characters. Compare asynchronous transmission.

Telecine

1. A device which consists of a projector without the lens and a video camera aimed directly at the illuminated film to record it. A telecine projector incorporates a five-bladed shutter splitting the film into 1/120 second flashes and resulting in two exposures of film for each video field. Since these would not necessarily be of the same film frame, the video fields would often have two different images superimposed. This can cause problems with videodisc still framing.
2. A Rank or Bosch. These are the highest-quality devices for film-to-video transfer. Unlike a telecine projector, they do not use a lens. Instead, a dot of light on one side of the film and a light sensor on the other side is used to scan the film. The Rank uses a small picture tube as the source of the dot of light. This is called a flying-spot scanner. The Bosch uses a one-dimensional CCD array. Both the Rank and the Bosch produce excellent results. The Rank has the advantage of changing the scanning size electronically, allowing control over the size and position of the film area being scanned. Both of these machines have highly developed methods of color correction, allowing very selective

work. For example, a single shade of color in a particular area of the picture can be changed without affecting anything else.

Television Receiver

A device capable of accepting video signals broadcast as RF. Also capable of producing a demodulated video signal output from a off-air input signal. Compare monitor.

Television Set

A display device capable of receiving broadcast video signals (such as commercial television broadcasts) by means of an antenna. Compare RGB monitor.

Test Pattern

An optical guide for television camera reference alignment.

Time Base Corrector (TBC)

A time base corrector, or TBC, is a device which corrects the timing irregularities that occur during VTR playback.

Since synchronization between videotape decks is so important, it is imperative that all decks perform at precisely the same speed. Speeds always vary, at least slightly, due to VCR velocity errors and tape stretch. TBCs are essential for any kind of multiple mixing of input from videotape source decks, including wipes, dissolves, and overlays. Each source deck must have its own TBC, and each must be synchronized to "house sync."

TBCs are also used simply to "clean up" the timing of a recorded video signal. These TBCs act like black boxes, taking in unstable video and putting out stable video. Because they work alone, without house sync, they are often called standalone TBCs.

Time Base Stability

The maintenance of the scanning process to very close tolerances. See time based corrector.

Time Code

See SMPTE time code.

Time Code Editing

By recording a sequential time code along with the video and audio material, you can obtain a precise reference for editing. Each frame has its own number or code which tells the time in hours, minutes, and seconds, and includes a frame number. The industry standard code is called SMPTE time-code . Time code permit very fast and accurate editing. Automatic editing is possible using an edit controller. See EDL, edit controller. Compare control track editing.

Timecode, 8 mm

8 mm timecode is a proprietary form of timecode used by Sony with some of their Hi8 products. Compatibility problems in time-code editing environments is solved by using a third-party device made by Horita that converts the timecode from the Sony EVO-9850 and EVO-9800 editing decks to standard SMPTE time code.

Title Generator

A black and white camera that is used to shoot titles which are electronically superimposed on the video picture while shooting or during editing. Title color can be selected and changed independently. A more sophisticated device know as a character generator (CG) can generate titles directly.

Track

A grouping of homogeneous data within a movie file. Typical track types might include video, sound, transitional effects, closed caption text, MIDI data, etc.

Tracking

The angle and speed at which the tape passes the video heads.

Transcoder

A device used to convert from one video component set to another. For example, to dub a Hi8 tape to Betacam SP with the highest possible results, you would need to use a transcoding TBC which includes a transcoder capable of converting the Hi8 (Y/C) signal to the Betacam SP component (Y, R-Y, B-Y) signal.

TTL RGB

A type of video monitor that can accept only a limited number of digital values and display only a correspondingly limited number of colors. Compare analog RGB.

Underscan

A mode available on professional video monitors which decreases the raster size H and V so that all four edges of the picture are visible on the monitor. Allows viewing of skew and tracking which would not be visible in normal (overscanned) mode. Also helpful when aligning test charts to be certain they touch all four corners of the raster.

Valid Signal

A video signal which will remain legal when transcoded to any other format. Signals which are not valid will be processed without problems in their current format, but problems may be encountered if the signal is transcoded to a different format. For example, the Macintosh will let you generate highly saturated colors which may be legal in the RGB domain, however, when converted to composite video will exceed the NTSC specifications. A valid signal is always legal, but a legal signal is not necessarily valid.

Vbox

The Vbox is a an interface device which can be connected to a personal computer via an RS-232 serial interface. Through the Vbox the computer can control LANC (also called Control-L) compatible video devices. The Vbox translates the VISCA commands from the computer into Sony's LANC protocol. Up to 7 Vboxes can be daisy-chained from one serial port. See LANC, VISCA.

VCR

Video Cassette Recorder. See VTR.

Vectorscope

A round oscilloscope used to analyze and align the amplitude and phase of the color video signal.

Vertical Blanking

See vertical interval.

Vertical Interval

The period of time during which the scan is retraced from the bottom of the screen back to the top. The picture is blanked during this part of the scan. The vertical interval period contains sync pulses and in broadcast use, can contain network information, test signals and closed captioning signals.

Vertical Interval Time Code (VITC)

VITC is recorded within the video signal, each timecode stamp is recorded between the video frames, during the vertical blanking interval. VITC cannot be recorded on audio tracks. With VITC, video devices can capture the timecode from the video deck when it's paused or in "crawl" mode, however, most synchronizers cannot read VITC at speeds exceeding about ten times playback speed, preventing slaved machines from maintaining synchronization during rewind and fast forward. See SMPTE time code, compare longitudinal time code.

Vertical Retrace

The return of the electron beam to the top of a television picture tube screen or a camera pickup device target at the completion of the field scan.

Vertical Scan Frequency

The frequency of the vertical sync pulses, or the frequency of the vertical scan. NTSC vertical scan frequency is 59.9 Hz. The Macintosh video vertical scan frequency is 67.7 Hz.

Vertical Sync

A pulse used to trigger the vertical retrace of a scanning electron gun from the bottom of a frame back to the top.

Vertical Sync Pulse

A portion of the vertical blanking interval which is made up of blanking level and six pulses (92% duty cycle at -40 IRE units) at twice the horizontal sync pulse repetition rate. Synchronizes vertical scan of television receiver to composite video signal. Starts each frame at same vertical position (sequential fields are offset 1/2 line to achieve interlaced scan.

Video

1. A means for reproducing moving visual images by representing them with an analog electronic signal. The images are decomposed into a series of horizontal scan lines. In this way the signal can be stored, transmitted and reproduced. See rasterization, field, frame.
2. Referring to the NTSC composite video standard. This is a widespread standard such that the "video in" of one machine is compatible with the "video out" of another.
3. There are various standards which define this signal, see RS-170, RS-170A, NTSC, PAL, SECAM, RGB, CAV.

Video Distribution Amplifier

A special amplifier for strengthening the video signal so that it can be supplied to a number of video monitors or other devices at the same time.

Video Editing

Editing is the process of selecting the frames and arranging them on the edit master videotape. In professional applications usually edits must be frame accurate. For example. When mastering a laserdisc frame accuracy absolutely essential, especially when single frame elements are involved. See off-line, on-line, et al.

Video Format

A standard determining how a video signal is recorded onto videotape. These include 1-inch Type C, 3/4-inch U-Matic, 3/4-inch U-Matic SP, Betacam, Betacam SP, M-II, D-1, D-2, D-3, VHS, Hi8, Video 8, Beta, and S-VHS.

Video Monitor

A display device that can receive video signals by direct connection only and cannot receive broadcast signals such as commercial television; it can be connected directly to the computer. Compare television set.

Video Recording

Any image, still or moving, can be converted into a video signal, most often through a video camera. Then the video signal can be recorded. By far the most common method of recording video is on videotape.

Video Signal

A dynamic signal which represents the varying levels of a video image but does not contain the sync pulses for its display. The video signal can be combined with sync pulses into a composite signal.

Video Waveform

The pictorial display on a waveform monitor (a special oscilloscope) of the various components of the video signal, used to check the integrity of the signal and signal components.

Videocassette

A self-contained video module played on a specially designed video tape recorder; similar in design to an audio cassette; houses two reels (supply and take-up) with the tape running between them but connected to both.

Videodisc

A double-sided optical disc capable of storing and playing back full-motion video. Videodisc has come to refer to all video media that are disc-shaped, regardless of whether they are optical or magnetic, digital or analog.

Videotape

A magnetic medium capable of storing an electronic signal and consisting of backing, binder, and coating. The coating usually consists of iron

oxide, however, metal particle or metal evaporated coatings are also used.

Videotape Formats

Videotape equipment can be expensive or inexpensive. Nevertheless, both produce the same 525-line, 30-frame-per-second image. The differences lie in visual quality, generation loss characteristics and in control capabilities.

VISCA

Acronym for Video System Control Architecture. VISCA is a device control language designed for synchronized control of multiple video devices. The protocol is device and platform independent. See LANC, V-Box.

VITC

See Vertical Interval Time Code.

VTR

Video Tape Recorder. An electro-mechanical device capable of recording, storing, and reproducing an electronic signal which contains audio, video, and control information. The term VTR includes reel-to-reel and cassette type (VCR) recorders.

Waveform

(1) The shape of a wave (a graph of a wave's amplitude over time).

(2) Slang for waveform monitor.

Waveform Monitor

An oscilloscope used to display the video waveform.

Wavelength

The horizontal extent of one complete cycle of a wave.

Window Dubs

The trick to off-lining is to always have access to the timecode for all of the source material. If the source medium is of professional quality, like Betacam SP, then viewing the material is expensive and complex. But it is also unnecessary: the material can be transferred to a more accessible medium, like 3/4-inch or VHS tape, with the timecode "burned in" on the picture, usually near the bottom. This is called a window dub. Each video frame is marked permanently with the exact timecode number. The advantage this offers is the ability to see the timecode on a VCR without a timecode reader. This assures frame accuracy during off-lining. Window-dubs are the video equivalent of workprints in film.

Wipe

A visual transition between images during which the edge of one image moves across the screen revealing the next image.

Wow and Flutter

Small fluctuations in tape speed. Wow is a gradually occurring change; flutter is a rapidly occurring change. A widely used specification in analog audio and videotape recorders.

XLR Connector

A connector with three conductors used in professional audio applications, typically with a balanced signal. Compare RCA connector and BNC connector.

Y, C1, C2

A generalized set of CAV signals: Y is the luminance signal, C1 is the 1st color difference signal and C2 is the 2nd color difference signal.

Y, I, Q

The set of CAV signals specified for the NTSC system: Y is the luminance signal, I is the 1st color difference signal and Q is the 2nd color difference signal.

Y, Pb, Pr

A version of component video (Y, R-Y, B-Y) specified for the SMPTE analog component standard .

Y, R-Y, B-Y

The general set of CAV signals used in the PAL system as well as for some encoder and most decoder applications in NTSC systems; Y is the luminance signal, R-Y is the 1st color difference signal and B-Y is the 2nd color difference signal.

Y, U, V

The luminance and color difference components for PAL systems; simply the Y, B-Y, R-Y components with new names. The derivation from RGB is identical.

Y/C Delay

Lag of timing between the luminance (Y) and chrominance (C) signals.

RAM Disk: Description, Setup, and Use

What is a RAM disk, and why would I use one?
This article has been archived and is no longer updated by Apple.
You can set aside a portion of your computer's memory to function like a disk drive, called a RAM disk. With a RAM disk, you can save and retrieve files very quickly, but the files are stored only temporarily. This feature is not available on all models of the Macintosh.

Using a RAM disk is faster and conserves power because the computer uses less energy and time to access RAM than it does to access a hard disk or a floppy disk.

PowerBook users may want to use a RAM disk to maximize battery life. Commonly used files could be stored on the RAM disk, which requires less power to access than a hard disk drives. Also, accessing frequently used files from RAM allows the PowerBook to spin down the internal hard disk more often.

Memory assigned to a RAM disk is not available for opening programs, so keep this in mind when you select the size of your RAM disk. It should typically not be more than 25% to 50% of your available memory or other applications may not have enough RAM to function properly.

To create a RAM disk:

1. Select the memory control panel from the control panels menu item under the Apple menu.
2. Click On to create the RAM disk.
3. Drag the lever to choose the percentage of available memory you want to use for your RAM disk. Choose a size large enough to accommodate what you want to put on the RAM disk, but not larger.
4. Close the Memory control panel.
5. Select Restart from the Special menu.

You won't see the RAM disk icon until you've restarted.

Warning: Choosing Shut Down erases the contents of the RAM disk though a dialog box will alert you to this fact.

Since RAM disk storage is temporary, it's a good idea to observe some precautions when using a RAM disk:

- Don't store your only copy of a file on a RAM disk. Keep an extra copy on a hard disk or a floppy disk.
- Before using a program on a RAM disk, test the program on another disk (hard disk or floppy) to make sure it works properly.
- Always save the contents of your RAM disk on another disk before turning off your computer.

You use a RAM disk exactly as you would any other disk, except that you must save your work onto another disk before shutting down.

To erase a RAM disk, you can either :

- Click on the RAM disk icon on your desktop then select Erase Disk from the Special menu
- Drag everything in the RAM disk to the Trash then select Empty Trash from the Special menu
- Shut down your computer, then turn it back on.

These methods won't remove the RAM disk itself or make more memory available for opening programs.

Note: If file sharing is active, you may not be able to erase a RAM Disk. Use the File Sharing control panel to verify the status of file sharing.

For additional RAM Disk information, see the following articles:

RAM Disk: Resizing or Deleting

This article describes how to resize or delete a RAM disk.

This article has been archived and is no longer updated by Apple.

1. Copy any files you want to save onto a hard disk, move any remaining files to the Trash and empty the Trash.

Note: If Multiple Users is turned on, the RAM disk may be shared and you may not be able to move or delete all of its files. In that case, you must have an owner account in order to change the RAM disk's access privileges.

2. Select the Memory control panel from the control panels menu item under the Apple menu.

3. Drag the lever to choose the percentage of available memory you want to use for your RAM disk. Or click the Off button if you want to remove the RAM disk.

Note: You can't change the RAM disk setting while there are files on it.

4. Close the Memory control panel.

5. Choose Restart from the Special menu.

If you resized your RAM disk, a new RAM disk icon appears on the desktop when the computer restarts. If you removed your RAM disk, no icon appears.

For additional RAM Disk information, see the following articles:

Power Macintosh: Turn on Virtual Memory for Best RAM Usage

This article explains why virtual memory should be turned on with Power Macintosh computers.
This article has been archived and is no longer updated by Apple.
Application programs written for Power Macintosh computers have code stored in their data fork as one large code fragment, which is loaded into memory when you open the program. For this reason these kinds of applications require larger amounts of memory (RAM) when virtual memory is turned off. When virtual memory is turned on, they require much less RAM.

Virtual memory on the Power Macintosh uses file-mapped virtual memory. This allows the code fragment to be divided up into 4K blocks and to only load when it is executing. If the program branches to code that is not in RAM, it is simply read in from the disk instead of all at once when the program is open.

For maximum memory use, you should turn on virtual memory in the Memory control panel.

Note: There are situations when turning virtual memory on may prevent optimal performance. Turn virtual memory off if you suspect that it may cause issues with certain programs. Be sure to read the system requirements for your application programs. Generally, they say if virtual memory should be on or off.

System 7.5 - Mac OS 8.1: Additional Find File Search Options

This article tells how to use four undocumented search options available in the Find command in System 7.5.x, 7.6.x, Mac OS 8 and Mac OS 8.1.
This article has been archived and is no longer updated by Apple.
The Find command (Command+F) in System 7.5 through Mac OS 8.1 lets you search for a variety of file attributes. There are four additional search options available under the first pop-up menu selection in the Find File dialog box. Hold down the Option key while selecting the "name" pop-up and these additional selections appear:

- **Contents:** Find files containing a specific string or phrase (up to 30 characters)
- **Name/Icon Lock:** Find all locked/unlocked files.
- **Custom Icon:** Find all files that either do or do not have a custom icon.
- **Visibility:** Find all visible/invisible files.

These additional search criteria are "undocumented features" of Find File. As such, their use is not officially supported.

For information related to invisible files and Sherlock, see the following article:

Apple SCSI Terminator: Description of Active Terminator

This article provides a description and information for the new Apple Active SCSI Terminator part number M3503LL/A.
This article has been archived and is no longer updated by Apple.
The Apple SCSI Active Terminator is the new style of SCSI terminator (service part number 922-1185). It replaces service part number 658-8032.

Question: What does it do?
Answer: The Apple SCSI Active Terminator includes a voltage regulator and capacitors to filter the term power. Active termination is one of the alternatives specified in the new SCSI specifications. The active termination is much less sensitive to variations in the termination power supplied by various SCSI devices.

The active terminator functions as follows:

The terminator voltage supplied by the device, typically between 4.25 Vdc and 5.25 Vdc is applied to a low drop voltage regulator and the output is regulated to 2.85 Vdc which is then applied to 110 ohm series termination resistors.

Question: Does it turn off or turn on?
Answer: No, the regulator is on when ever termination power is supplied to it.

Question: Why isn't there a LED on it indicating activity?
Answer: A complete redesign of the tooling for the terminator housing would be required to fit an LED to the terminator. Since the terminator is at the back of the peripheral, out of sight of the user, the benefit of an LED would be minimal.

Question: Does it adjust for resistance or impedance issues?
Answer: No, its designed for regulating the termination power supplied by SCSI devices.

Question: Why would someone want this one over the old one?
Answer: Improved reliability of the term power signal level.

Question: Did the finished goods part number change to a /B?
Answer: No, this is the first revision of this part, not a revision of the old part. The new part number is M3503LL/A.

Question: How can I differentiate it from the old terminator from the outside?
Answer: The previous non active SCSI terminator has part number 590-0304-A embossed in the plastics. The new active SCSI terminator has part number 590-0772-A embossed in the plastics.

Question: Is it required by any current or future computers?
Answer: This new active SCSI terminator is not required for any specific computer or peripheral from Apple. It is a replacement for the current terminator. The IIfx and some LaserWriter printers still require the black terminator.

AppleShare: Quick Start Instructions

This article will help you set up your AppleShare server.
This article has been archived and is no longer updated by Apple.

Introduction

This Quick Start article will help you set up your AppleShare server. While this article will get you started quickly with your AppleShare server, the documentation supplied with your software -- both printed and electronic -- contains important additional information. The instructions in this section assume you have already performed these tasks:

* You have set up the server computer and connected the server computer to the network.

* You have activated AppleTalk in the Chooser window and selected the appropriate network type in the Network control panel.

* AppleShare 4.0.x (Apple Workgroup Server 60, 80, 6150, or 8150), or AppleShare Pro (Apple Workgroup Server 95) is installed on your Apple Workgroup Server.

If you have not yet performed these tasks, see the documentation that came with either your server computer, or the manual that came with your network cabling system.

Note: Make sure you have all of the components assembled before starting.

Setting Up File Service

---

1) Choose the AppleShare Admin program alias from the Apple menu.

2) Apple Workgroup Server 60, 80, 6150, or 8150: Enter a contact name and telephone number, and the name of your organization, then enter your serial number and click OK.

3) Name the file server.

4) Enter an Admin Key and then click OK.

IMPORTANT: Remember your Admin Key! This is the last time you'll see the Admin Key on the screen. Record it somewhere. Replacing a forgotten Admin Key is difficult and time consuming. See the "Troubleshooting" chapter in your setup manual for instructions on replacing the Admin Key.

5) Confirm the Admin Key and then click OK.

6) Enter your administrator name and password and then click OK.

After a few moments, you see three windows -- the User List, Group List, and User Information windows. For now, you will work only with the User Information window. Each user account you create will have its own User Information window. This one is for you as the administrator.

7) Enter an administrator name in the Name box.

8) Enter a password.

IMPORTANT: Don't use a password that is the same as the Admin Key. Keeping the two distinct provides an added level of server security.

9)
Verify your AppleShare options. These options are explained in the section "Registering Users" in Chapter 2 of the AppleShare administrator's guide.

10) Click Save.

11) Close the User information window.

Allowing or Denying Guest Access

If you allow guest access, anyone connected to the network can log on to the file server. If you deny guest access, only registered users can log on. The program is preset to deny guest access.

IMPORTANT: If you are not sure whether to allow guest access, do nothing for now. You can always change the setting later.

1) Open the User List window, if it isn't already open.

2) Double-click the <Any User> entry in the User List window.

3) Click the Login Enabled checkbox to place an X in it.

4) Click Save.

5) Close the User Information window.

Registering Users

Registering users means assigning each user a personal file server account. Each user you register is listed in the Users and Groups Data File kept in the server's Preferences folder.

1) Choose Create User from the Users menu.

2) Enter the user's name.

3) Enter a password.

4) Select this user's AppleShare options.

Here's a brief summary of how these options function:

Login Enabled lets the user log on to the file server. You must select this option to let the user gain access to the file server.

Change Password Enabled lets the user change his or her own password.

All Privileges Enabled gives the user access to all volumes and folders on the server computer, regardless of whether you've shared them.

Require New Password on Next Login makes the user change the password the first time they log on to the file server.

Program Linking Enabled allows a user to create a link between a program on the server and a program on the user's computer. If other networking services are installed on the server computer, the list of options may be longer.

5) Click Save to confirm the entries.

6) Close the User Information window.

7) Repeat steps 1 through 6 for each user you want to register.

Setting Up and Adding Members to Groups

Creating groups allows you to consolidate access privileges for volumes and folders available on the file server. For more information, see Chapter 2, "Setting Up File Service," in the AppleShare administrator's guide.

1) Choose Create Group from the Groups menu.

2) Enter a name for the group.

3) Click Save.

4) Choose User List from the Users menu, then select the users you want to assign to this group.

5) Drag the icons representing the users you selected to the Members box in the group window.

6) Close the group window.

Sharing Volumes and Folders and Setting Access Privileges

Now that you've registered users and created groups, you need to share volumes on the file server. This means you will indicate which hard disks and folders you want to make available to users on the file server. If you need more than the following information, refer to the documentation for a

complete description of sharing volumes and setting access privileges.

1) Choose Access Information from the Privileges menu.

2) Select a volume -- or a folder from within a volume -- from the Volumes list.

IMPORTANT: When you share an entire hard disk, all of the folders contained on it are available to users. Also, AppleShare Pro does not allow you to share the "/" volume. You must share specific folders within the / volume to share the contents of the / volume. Also, if you choose a mount point for a shared disk within a volume or folder, you cannot share the enclosing volume or folder. Disks that are mounted within a folder must be shared through explicit privileges. See the "AppleShare Pro Administrator's Guide" for additional information.

3) Click Share to share the selected volume or folder.

NOTE: The Share button changes to an Unshare button each time you share a selected volume or folder.

4) For folders, click the Same as Enclosing Folder option to remove the X.

5) If necessary, assign an owner to the volume or folder. You can change ownership if you want, using the following procedure:

5-a) Select the volume or folder in the Shared Items box.

5-b) Select the user or group you're assigning ownership to.

5-c) Select the icon of that user or group and drag it to the Owner box in the Access Information window.

6) Assign a user or group to the volume or folder.

You need to indicate which user or group will have access privileges for each shared item:

6-a) Choose User List from the Users menu or Group List from the Groups menu.

6-b) Select the user or group you're assigning privileges to. You can choose one user or one group.

6-c) Select the icon of that user or group and drag it to the User/Group box in the Access Information window.

7) Select the access privileges for the volume or folder.

8) Select the access privileges for guests by clicking the appropriate boxes for Everyone.

9) If you want to apply the same access privileges to all the folders within the volume or folder you've shared, click the Change All Enclosed Folders checkbox to place an X in it.

10) Click Save.

11) Click the button representing the choice you want and click OK.

12) Repeat steps 2 through 11 for each item you want to share.

13) Close the Access Information window.

14) Quit the AppleShare Admin program.

Starting the AppleShare File Server Program
Choose the AppleShare File Server program alias from the Apple menu.

Setting Up Print Services
This section explains how to capture a printer for spooling documents over the network, set printer options, and begin using print service.

1) Choose the AppleShare Print Server alias from the Apple menu.

2) Select the icon for the type of printer you want to capture in the Printer Types box.

3) If necessary, select the zone the printer is in.

4) Select the printer you wish to capture from the Available list.

5) Click Capture.

6) Select the options you want for this printer.

7) Click OK. The program captures the printer you selected. In a moment, two windows appear -- the Queue and Log windows for the captured printer.

8) Close the Queue and Log windows. You won't need to use these windows until after users begin using the print server.

9) Choose Setup from the File menu. The Setup window appears again.

10) Repeat steps 2 through 8 for each additional printer you want to capture.

11) Verify that all users have the same printer drivers installed on their computers.

NOTE: You will not experience significant Print Server performance differences between AppleShare 3.0.x, AppleShare 4.0.x, and AppleShare Pro because the bottleneck in print server performance is the printer, not the server.

Where to Get More Information
For additional information about AppleShare, you have two other sources of information:

The AppleShare 4.0.x or AppleShare Pro Administrator's Guide -- either the electronic or printed version-and Balloon Help, which is built into the AppleShare software.

QuickTime: Installation Failed Message at Startup

My computer gives me this message each time it starts up: "QuickTime installation has failed because QuickTime was already installed." I do not understand this message because I am not trying to install anything. What is going on?
This article has been archived and is no longer updated by Apple.
If your computer gives you this message each time it starts up, you have two copies of the QuickTime extension somewhere in your System Folder. You may have one in the Extensions folder and one loose in the System Folder. You may have two different versions of the QuickTime extension or two copies of the QuickTime extension that are the same version, but are named differently residing in your Extensions folder of your System Folder.

Try these two procedures to make sure you have only one copy of QuickTime in your System Folder:

Procedure 1
==========

Step 1

Open your System Folder.

Step 2

Click on the Views menu and choose By Name.

Step 3

If you see an item called QuickTime or QuickTime 2.0 loose in the System Folder, drag it to the Trash. Make sure you have disabled the "Protect System Folder" feature in the General Controls control panel first. If you do not see an item called QuickTime, go to Procedure 2.

Step 4

Restart your computer to make sure the error message does not appear.

Procedure 2
==========

If you do not see QuickTime loose in the System Folder, open your Extensions folder. You may see one extension labeled QuickTime and one extension labeled Quicktime 2.0 or other version.

Step 1

Highlight one of the files by clicking it ONE time.

Step 2

Select "Get Info" from the File menu and check the version displayed in the Info window. Keep the later version, (for example, 2.0 is later than 1.6) and move the older one to the Trash. If they are both the same version, it does not matter which one you remove.

Step 3

Restart your computer to make sure the error message does not appear.

Many third-party CD-ROM disc games will add QuickTime when they are first installed on your computer. Some games may contain an older version of QuickTime which may replace your newer version. Any computer which comes with System 7.5 also comes with QuickTime 2.0. If your copy of QuickTime 2.0 has been replaced with an earlier version, you will need to either reinstall it from your original floppy disks or CD, or restore your system software if you have a Macintosh Performa computer.

Energy Saver Won‘t Work w/All Power Macintosh Models

When I install the Apple Multiple Scan Display software on a PowerBook 200 Series computer (Duo) running System 7.1.1, everything installs fine. However, when I install the same software on a Power Macintosh 6100/66 or 7100/80/AV running System Software 7.5, the Energy Saver control panel does not install. Why not?

This article has been archived and is no longer updated by Apple.

The Power Macintosh 7100/80, 8100/100 and 8100/110 computers were tested with the energy saver utility software from the Connectix Desktop Utilities which shipped with these models in the Apple Extras folder. That is the only energy saver software that should be installed onto these Power Macintosh computers.

The Apple Multiple Scan Display software does not install on any Power Macintosh computer which is running System Software 7.5. This is because the Multiple Scan Display software functionality (but not the Energy Saver Control Panel) is already included in System Software 7.5.

Extensions Manager: Extensions Off Compared To Shift Down When You Start Up

Does using the Extension Manger "All Off" set do the same thing as holding down the Shift key when starting up?

This article has been archived and is no longer updated by Apple.
The Extensions Manager's All Off set and restarting while holding down the Shift key do not have the same effect. Each method "switches off" or "disables" some types of extensions that the other does not.

Holding the Shift key during startup instructs Mac OS to not load any item that is in the Extension folder, Control Panels folder, or the Startup Items folder. Holding the Shift key during startup does not cause any item to move. The Extensions Manager control panel, however, does physically move items around, but only listed items. When you use the "All Off" set, the Extensions Manager control panel moves all listed items to their respective "Disabled" folder, such as Extensions (Disabled). Items that are not listed in the Extensions Manager control panel are not physically moved, and therefore still load during start up.

Some control panels, including the Startup Disk control panel and the Extensions Manager control panel itself, can be opened after starting up with the "Shift down" method.

The Extensions Manager control panel can also be accessed before most extensions load by holding the Space Bar during start up.

For example, the Extensions Manager switches off Chooser extensions, but holding the Shift key down during restart does not. The Extensions Manager does not display or switch off all extensions, whereas the Shift down restart does disable all extensions.

When you are trying to isolate an extension conflict and are not sure if it is an Apple System extension or a third party extension, restart while holding down the Shift key.

Few third party software items use extension types that the Extensions Manager does not recognize and turn off in the All Off set. If you cannot start up with extension disabled by holding the Shift key, start up from a Mac OS CD or floppy disk. It may be necessary to reinstall your system software, or perform a clean installation of it. If you cannot start up from a Mac OS CD (or floppy disk), there may be an issue with a hardware device attached to your computer, or with an internal hardware upgrade.

LaserWriter 16/600 PS: Configuration Switch Settings

What is the purpose of the two position configuration switch located on the LaserWriter 16/600 PS?
This article has been archived and is no longer updated by Apple.
The configuration switch on the LaserWriter 16/600 PS printer provides flexibility in configuring the LocalTalk, Ethernet, and Parallel ports. When the switch is in the DOWN position all of the ports are placed in a default configuration which cannot be modified. When the switch is in the UP position the printer uses the custom communication settings that have been configured using the Apple Printer Utility. Allowing both a custom and a default switch position ensures that the user will always have communication access to the printer even if the user makes modifications in the custom mode which prevents communication with the printer.

In the default mode (DOWN) the communication ports are configured as follows:

Communication Port	Mode
LocalTalk Port:	PostScript
Ethernet Port:	
EtherTalk:	PostScript
NetWare:	AutoSelect
TCP/IP:	AutoSelect
Parallel Port:	AutoSelect
Speed:	Fast
Protocol:	Raw

In the custom mode (UP) the communication ports can be configured as follows:

Communication Port	Mode
LocalTalk Port:	PostScript*
Ethernet Port:	
EtherTalk:	PostScript*, Off
NetWare:	PostScript*, PCL5, AutoSelect, Off
TCP/IP:	PostScript*, PCL5, AutoSelect, Off
Parallel Port:	PostScript*, PCL5, AutoSelect
Speed:	Fast*, Compatible
Protocol:	Normal*, Raw, Binary, TBCP
An asterisk '*' denotes the default values for the custom mode.	

For more detailed information consult the LaserWriter 16/600 PS User's Guide.

PowerBook: Missing Menu Bar Battery Indicator

This article explains what to do if the Menu Bar battery indicator is not visible.
This article has been archived and is no longer updated by Apple.

Symptom:

Menu Bar battery indicator is not visible.

Products Affected:

- PowerBook computers

Solution:

This issue is probably caused because the "Show the battery level" option is not enabled within the Date & Time control panel. To correct this:

1. Open the Date and Time control panel.
2. Click Clock Options.
3. Click the checkbox to enable the "Show the battery level" option.
4. Click OK.

Published Date: Feb 20, 2012

AppleShare Volumes: Disabling Automatic Log On

When my Macintosh starts up, an AppleShare log on dialog appears for server volumes that no longer exist on the network. How can I get rid of these attempts to log on to nonexistent server volumes?

This article has been archived and is no longer updated by Apple.

For Systems 6, 7 and Mac OS 8.x:

Automatic log on can be disabled by dragging the AppleShare Prep file (System Folder: Preferences: AppleShare Prep) to the Trash. Removing this file will eliminate automatic log on for all server volumes. Restoring automatic connection to specific server volumes at startup can be accomplished in the usual fashion.

For Mac OS 9/AppleShare client 3.8.5 & higher:

Automatic log on can be disabled by dragging to the Trash the server's alias that has been placed in the Servers folder in the System Folder. Each server that mounts at start up has a corresponding alias in the Servers folder.

Note: Some third-party software, such as Suitcase, will also attempt to mount remote volumes at startup. The third-party vendor should be contacted for instructions on disabling automatic log on with such software.

Resetting the PRAM loses the contents of a RAM disk

Resetting Parameter RAM (PRAM) deleted my RAM disk and its contents. Why?
This article has been archived and is no longer updated by Apple.
If you are using a RAM disk, and Parameter Ram (PRAM) is reset, by simultaneously holding down the Command-Option-P-R keys at the initial startup chime, the settings in the Memory control panel revert to their factory defaults.

The default setting for a RAM disk in the Memory control panel is "off". As a result, any contents on a previously active RAM disk are lost when the PRAM is reset.

This happens regardless of whether or not the RAM disk is the startup disk. The presence of the Assistant Toolbox extension (on a Powerbook computer) does not prevent this data loss. You should back up all important items from a RAM disk to another disk before resetting the PRAM.

Note: Restarting the computer does not purge the contents of the RAM disk. Selecting Shut Down from the Special menu or powering the computer off using the power switch erases the contents of the RAM disk, unless the Assistant Toolbox extension for PowerBook computers, or a similar utility for other Macintosh computers is installed. If the computer is shut down in this manner, the contents of the RAM disk cannot be retrieved even if the computer is immediately restarted.

Finder Search Path For Applications

This document lists the order in which the Finder (Mac OS 9 and earlier) searches for an application that can open a file.

This article has been archived and is no longer updated by Apple.
With System 6 through Mac OS 9, the Finder searches its desktop database for an application that can open files with the same file type as the document. The Finder searches for the application in this order:

1. An application that is already open, having the same creator code as the file.
2. An application on the same volume as the document being opened.
3. An application on the startup volume.
4. An application on any available mounted volume.

In the event that multiple versions of the same application are found on one volume, the Finder opens the application whose record in the desktop database was updated last. This is usually the last version installed.

QuickTime: Erratic Sound & Movies From CD-ROM

Music CD-ROM discs played from my PowerBook 540 computer sound choppy. The same thing happens if I try to play QuickTime movies from a CD-ROM. When I place these CD-ROMs in another computer, they play fine. Why?
This article has been archived and is no longer updated by Apple.
If playback of QuickTime movies and Audio CDs are choppy, slow, skip, or jump around, check the following:

Step 1
If you have a PowerBook, turn off Processor Cycling (in the PowerBook Control Panel).

Step 2
On all Macintosh and PowerBook computers, turn off Virtual Memory (in the Memory Control Panel).

Step 3
Turn off or quit applications running in the background before you try to play the music or the movie.

CloseView: Can it Do Screen Inversion Only?

This article provides a solution to having on screen text enlarged and the color inverted.
This article has been archived and is no longer updated by Apple.
There is no ResEdit solution available to do this. However, there is a solution available from the ALVA Access Group's called inLarge.

Note: The following information was take from the ALVA Access Group Web site.

inLARGE is a full featured screen magnification program for the Macintosh which offers 1 to 16 times magnification of all or part of the screen, the ability to invert the screen to white on black with "smart color inversion," an adjustable cross hair option for easy cursor location, three different glass motions, and much, much more.

The wide range of options available with inLARGE is designed to allow users to customize the program to fit their individual needs. inLARGE can be adjusted to give people with low vision access to most Macintosh applications, or it can provide relief from the eye strain caused by spending a lot of time in front of a computer. The "Scan Mode" provides easy hands-free reading on a magnified screen and the "Background" option prevents distraction by blacking out all parts of the screen except that which you are reading. And, the ability to magnify just a portion of the screen is useful for doing detailed graphics work.

inLARGE commands (including Help) are easily accessible by intuitive keyboard commands or from the control panel interface.

inLARGE 2.1 Features

- Full or partial screen magnification
- Magnification levels: 1 to 16
- The ability to stretch and condense the image
- The ability to invert the screen to white on black with "smart color inversion"
- An adjustable Crosshairs option for easy cursor location
- 3 motion settings: Push. Continuous, Centered
- Automatic Scanning for hands free reading
- Alternate view allows you to see the entire screen and the area that will be magnified
- The Background option provides distraction free viewing by focusing only on the magnified portion of the screen
- All commands (including Help) are entered easily from the keyboard or through the control panel interface

inLARGE 2.1 Requirements

- Computer: Any Macintosh computer (68K based or PowerPC based, including PowerBooks, G3's and iMacs)
- Mac OS: Any version of the Mac OS from System 6.0.5 -- including Mac OS 8.6.
- Memory: At least 4MB of free RAM (more if running in high resolution and/or using a 19 inch or larger monitor).

Free inLARGE DEMO!
You can now download and try this latest version of inLARGE on your own Mac -- at no charge and no obligation! The Demo is the full featured version of inLARGE that will run for 20 minutes. (For additional time, simply restart your Mac.) This download also includes the complete User Manual, Reference Guide and other documentation.

AppleShare: Explicit and Inherit Access Privileges Explained

I've seen explicit and inherit access privileges with AppleShare File Servers. What do these terms mean? When and why would I use one type or the other? How do I make changes?
This article has been archived and is no longer updated by Apple.

Definitions

The terms explicit and inherit are commonly used when referring to access privileges with AppleShare File Servers. Here are definitions for explicit and inherit access privileges:

Explicit: Retain access privileges regardless of the enclosing folder's privileges.
Inherit: Always change to reflect access privileges of the enclosing folder.

The default on an AppleShare File Server is explicit access privileges. The default on Personal File Sharing is explicit access privileges.

"Default" Folder Privileges

On an AppleShare File server, each folder can have its own privileges assigned to it. When the administrator is setting up the server for the first time, all privileges default to the administrator as the owner, and no one else has privileges. But once the server is set up, and users start creating folders on the server, by default, any new folder will start off with the privileges of its parent--its enclosing folder-- except for the "Owner", which will always be the user who created the folder.

Under normal circumstances, when a folder is moved around on the server, to another enclosing folder, the privileges stay with it. They are "explicit".

There may be times when you want a folder to always adopt the privileges of its parent folder, even as it is moved around on the server. This type of privilege is called "inherited" or "adopted."

Choosing Between Inherited & Explicit Privileges

An advantage to explicit privileges is that they are more secure. It is less likely that access to a folder will be accidentally allowed, because the folder was moved on a server. Explicit privileges would be preferred for confidential information.

One advantage to using inherited privileges is that server startup time may be reduced. When the server is starting up, it must validate the information in the server volume's PDS files. If each folder has explicit privileges, they must all be checked. When folders have inherited privileges, they are using a flag that indicates "same as parent" so privileges for that folder do not need to be validated. If you've got a large volume with lots of folders, and you're noticing that its taking a very long time for the server to start up, consider changing some of your explicit privileges into inherited, where appropriate.

Older versions of AppleShare had an option to "Compact Access Privileges", a process which checked for folders that had the same privileges as the parent folder, and changed those privileges to inherited. AppleShare IP no longer has this feature.

How To Change Privileges From Explicit To Inherited

There are different ways of setting privileges of folders on an AppleShare server.

From the server, using the Web & File Admin program...

-To change a single folder's privileges:

1. Show Disk & Share Points
2. Navigate to the folder whose privileges you want to change.
3. Select that folder and click on the "Privileges" button.
4. Change the radio button to "Use enclosing folder's privileges" if you want the privileges to be inherited, or --"Set privileges for this item" if you want the privileges to be explicit.

-To change the privileges of every folder within a given folder:

1. Show Disk & Share Points
2. Navigate to and select the parent folder
3. Hold down the Option key while selecting the "Enclosing Folder" button, and select explicit or inherited, from the dialog box.

From a workstation...

-To change privileges on a single folder:

1. Log into the file server (you must be the folder's owner or an administrator of the server to change privileges from a workstation; this is determined by the user name you use to log in to the file server).
2. Mount the volume where the folder resides.
3. Select the folder in the Finder.
4. Choose "SharingŠ" from the File menu.
5. Check the "Use enclosing folder's privileges" box to give the folder inherited privileges, or UNCheck the box to give the folder explicit privileges.

To change privileges on all enclosed folders:

1. Use the "Copy these privileges to all enclosed folders" feature. Although the privileges on enclosed folders will be the same as the enclosing folder, they will be explicit privileges. From a workstation, you do not have the option to make all enclosed folders "inherit" their privileges.

CD-ROM: "This disk is unreadable" Message

This document offers troubleshooting tips for an optical drive that has difficulty reading a disc.
This article has been archived and is no longer updated by Apple.

Symptom

When you insert a disc into the drive an alert box with this message appears:

> "This disk is unreadable by this Macintosh. Do you want to initialize the disk?"

Solution

If other discs of the same type seem to work, make sure the disc is clean and free of scratches and debris. See technical document 50448: "**Mac OS 9: How to Handle and Clean CD and DVD Discs**".

When the optical drive does not recognize a particular type of disc, this usually indicates the CD-ROM software is not properly installed, or is missing certain files. In some cases, one or several CD-ROM "Access" files may be damaged or a third-party extension or control panel may be conflicting with the CD-ROM software. Try the following suggestions to resolve this issue:

Make sure you have not started your Macintosh with the Shift key held down; this disables the CD-ROM extensions and all other extensions. Make sure you have not disabled the CD-ROM extensions using the Extensions Manager or a similar third-party utility.

Make sure that these files are in the Extensions folder of your System Folder:

- Apple CD-ROM or Apple CD/DVD Driver
- Apple Photo Access (if you plan to use Kodak Photo CDs)
- Foreign File Access
- High Sierra File Access (not present in Mac OS 9.1 or later)
- ISO 9660 File Access
- Audio CD Access
- UDF Volume Access (not present prior to Mac OS 8.5)

If any or all of these files are missing, search the hard disk to see if they have been moved to a different location, then move the files back into the Extensions folder. You must restart the computer after moving the files to the Extensions folder for the files to work properly.

If the files listed above have been deleted, reinstall the CD-ROM software from your Macintosh System CD or system disks, depending on which one came with your computer. If you have updated the system software to a newer version, install the CD-ROM software using the system CD or disks for the newer system software.

If you do not have the option to custom install the CD-ROM software from your system CD or disks, it may be available for download.

Alternately, you may also reinstall the entire system software for your computer. This restores the necessary CD-ROM files.

If these files are damaged, drag the CD-ROM files mentioned above to the Trash, empty the Trash, then reinstall the CD-ROM software. Restart and test to see if the disc appears on the desktop.

If the preceding steps fail to resolve your issue, an extension may be conflicting with the CD-ROM software. Open the Extensions Manager control panel and choose "Mac OS Base" from the Sets pop-up menu.

When you restart the computer, only the extensions installed with your system software load. Test your CD-ROM discs to see if they work, then add extensions and control panels back one at a time, restarting after adding each one to isolate which extension is causing the conflict.

Note: If you are using system software earlier than System 7.5, you have to manually drag extensions and control panels out of the System Folder and restart each time to isolate the offending file.

Once you isolate the conflicting extension, contact the software manufacturer or vendor for compatibility information, or disable the extension to resolve the issue.

LaserWriter: Toner Cartridge Life

Why is there such a difference between the rated life of the LaserWriter toner cartridges and the actual life that I experience?
This article has been archived and is no longer updated by Apple.
It is nearly impossible to provide accurate toner cartridge life information because there are many variables affecting the toner requirements for a document. The formatting of the document, font type, and the inclusion of graphics significantly change the toner requirements.

To provide information about the average life of a toner cartridge, many manufacturers provide consumers with the expected number of pages that can be printed assuming a specific toner density. For instance, the LaserWriter 16/600 PS toner cartridge is expected to last 6,000 pages at 5% coverage. An average double-spaced Letter or A4 page using a single, monospaced font has a density close to 5%. Making a simple modification to the document, such as changing the font or making it bold, may increase the actual density value to 6% or 7%. Changing from a double-spaced to a single-spaced format doubles the amount of toner used.

Because most customers print a variety of different documents, the actual page life of a toner cartridge may vary significantly. For example, with a page density of 5%, the LaserWriter 16/600 PS has a rated life of 6,000 pages. However, if a solid black page (100% density) is printed, then the cartridge will run out of toner after approximately 300 pages [6,000 pages/(100%/5%)]. It is unusual to print solid black pages during normal use so most customers will experience a toner life somewhere between the two extremes.

Many laser printers also have the capability to adjust the toner density using a manual adjustment or software tool such as the Apple Printer Utility. Consult the printer's manual for more detailed information on changing the settings.

The chart below provides the approximate number of pages for the toner cartridges in each of these LaserWriter printers listed.

Printer	Part #	Yield (5% coverage
LaserWriter Pro 810 (Extended Capacity)	M3602G/A	13,000
LaserWriter Pro 600, 630, and 16/600 PS	M2473G/A	6,000
LaserWriter 12/640 PS	M4683G/A	6,000
LaserWriter II series	M6002 (new)	4,000
	M2795G/A (remftd)	4,000
LaserWriter Select 300, 310, and 360	M1960G/A	4,000
LaserWriter and LaserWriter Plus	M0180	4,000
Personal LaserWriter LS, SC, NT, and NTR	M0089LL/A	3,000
Personal LaserWriter 300, 320, and 4/600 PS	M2045G/A	3,000
Color LaserWriter 12/600 PS Color LaserWriter 12/660 PS	Cyan M3757G/A	4,000
	Magenta M3760G/A	4,000
	Yellow M3758G/A	4,000
	Black M3756G/A	4,000
LaserWriter 8500	M5893G/A High-Capacity Toner Cartridge	14,000

Mac OS 8, 9: Starting your computer from floppy or CD-ROM disc

This document describes ways you can start a Macintosh computer from a Utilities or Disk Tools floppy disk, or a system software CD which came with your computer.

Note: This document applies to Mac OS 9.2 and earlier.
This article has been archived and is no longer updated by Apple.
You may occasionally need to start your Macintosh from a device other than your hard drive in order to correctly use software such as Disk First Aid, Apple HD SC Setup, other utilities, or to troubleshoot an issue with other disk volumes.

Macintosh system software normally resides on the hard disk. System software, however, may also be installed on a floppy disk or on a CD-ROM disc, and it may be desirable to start the system using that software in order to investigate issues relating to the system software on the hard disk, or the hard disk itself.

Starting from Disk Tools disk or another startup diskette

1. From the Special menu, choose Shut Down.
2. Insert the Disk Tools disk or other startup disk.
3. Turn on the computer.

The Disk Tools or other startup disk icon will appear in the upper right hand corner of the screen. If your hard disk icon is visible, it should be right below the Disk Tools disk or Utilities disk icon.

Note: To eject the disk, choose "Restart" from your Special menu.

Starting from the Mac OS CD that came with your computer

1. Insert the CD-ROM.
2. From the Special menu, choose Shut Down.
3. Hold down the "c" key (lower-case C). Make sure that Caps Lock is not enabled.
4. Start up your computer.
5. Hold down the "c" key until you see Welcome to Macintosh.

The Mac OS or Power Macintosh CD icon will appear in the upper right hand corner of the screen. If your hard disk or Macintosh HD icon is visible, it should be right below the CD icon.

Note: To eject the CD-ROM disc, choose "Restart" from your Special menu. Immediately after you hear the startup chime, press the eject button on the front of the computer. The CD-ROM caddy will pop out or CD-ROM tray will open.

If the computer, for any reason, fails to start from your CD-ROM drive, follow the instructions described below.

Starting from an Install Me First CD, an Apple Macintosh CD on a non-Power Macintosh system, or a Macintosh Performa CD for a Performa 500 or 630 series computer

1. Insert the CD-ROM.
2. From the Special menu, choose Shut Down.
3. Hold down the Option, Command (Apple), Shift, and Delete keys. If you have a keyboard with a physical latch for the Caps Lock key, make sure the Caps
4. Lock key is in the "up" position.
5. Start up your computer.
6. Continue holding down the Option, Command, Shift, and Delete keys until you see Welcome to Macintosh.

On the top right side of the screen, you should see the Apple Macintosh CD, Install Me First CD icon, or Macintosh Performa CD icon. If your hard disk or Macintosh HD icon is visible, it should be right below the CD icon.

Note: To eject the CD-ROM disc, choose Restart from the Special menu. Immediately after you hear the startup sound, press the eject button on the front of the computer. The CD-ROM caddy will pop out or CD-ROM tray will open.

Disk First Aid: Extra Floppy Disk Shows in Main Window

I am using Disk First Aid 7.2 after booting from Disk Tools. When Disk First Aid's main window opens I see the Disk Tools disk on the Internal Floppy Drive and I see the SCSI ID 0 for the hard drive and I also see a third floppy disk named "unknown disk". What should I do?
This article has been archived and is no longer updated by Apple.
This issue has been occasionally reported to occur on PowerBooks. You should first make sure you do not have a RAM disk turned on in the memory control panel. To remove the extra floppy icon, you must reset your parameter ram using the following procedure:

1. Restart your computer.
2. After you hear the startup chime hold down the Command, Option, P, and R keys on the keyboard.
3. Continue holding these keys down until you hear a second startup chime.

When you restart with the Disk Tools disk and run Disk First Aid, the extra floppy will be gone.

Drive Setup: Compatibility Guide

This article explains which computers can use Drive Setup.
This article has been archived and is no longer updated by Apple.

Power Macintosh computers

Drive Setup is compatible with all Power Macintosh computers. It is not compatible with the Macintosh Processor Upgrade, or the Power Macintosh upgrade card. If the upgrade card is installed in a desktop computer with a Motorola 64040 or 68LC040 microprocessor and an IDE hard drive, open the 601 Processor Upgrade control panel and turn off the card before using Drive Setup.

Desktop computers with a Motorola 68040 microprocessor and an IDE hard drive

Drive Setup is compatible with desktop computers with a Motorola 64040 or 68LC040 microprocessor and an IDE hard drive. These include the Macintosh LC 580, and the Macintosh 630 series (LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640).

Note: Drive Setup cannot be used any desktop computer with a Motorola 68LC040 microprocessor that does not have an IDE hard drive, even if the computer has a Power Macintosh Upgrade Card installed. If you open Drive Setup on one of these computers, an alert box appears with this message, "Drive Setup cannot be launched on this computer."

PowerBook computers with IDE Drives

Drive Setup can be used on all PowerBook computers that have an IDE hard drive (see Note 1), including:

PowerBook 190
PowerBook Duo 2300
PowerBook 1400
PowerBook 3400
PowerBook 5300
PowerBook G3
PowerBook G3 Series
PowerBook G3 Series (Bronze keyboard)
PowerBook (FireWire)
PowerBook G4 computers
iBook computers

Other Macintosh computers

Drive Setup 1.3 and later support all Macintosh and Power Macintosh computers supported by Mac OS 8 (see Note 2).

Notes

1. The only exception is the PowerBook 150, which must use the Internal HD Format utility.

2. See technical document 30363 "**Mac OS 8.1: System Requirements and CPU Compatibility**"

Published Date: Feb 20, 2012

Energy Saving Control Panels: Description & Compatibility

What is the difference between all the different energy-saving control panels, and how do I know when to use them?
This article has been archived and is no longer updated by Apple.

Energy Related Control Panels Overview

There are four different energy-related control panels in System 7.5.

- Auto Power On/Off: Turns the computer ON and OFF at specified times.
- CPU Energy Saver: Turns the computer OFF at specified times, but not ON.
- Screen: Puts an internal monitor into energy-saving mode.
- Energy Saver 1.1: Puts an external monitor into energy-saving mode.
- Energy Saver 2.0: Combines functionality of CPU Energy Saver, Energy Saver 1.1, and Auto Power On/Off. Energy Saver 2.0 is compatible only on PCI-based Power Macintosh computers.

These control panels only work on certain Macintosh computers. In addition, the Energy Saver 1.1 control panel requires an Energy Star-compliant monitor as well as a Macintosh computer compatible with this software. See the chart at the end of this article for a list of compatible systems.

Although many Energy Saver control panels are compatible with many Macintosh Performa computers, not all Energy Saver control panels are bundled with Macintosh Performa computers. Many Macintosh Performa computers include modems and MegaPhone software, which allow you to use your computer as an answering machine. If you have installed Auto Power On/Off, it is possible for your computer to be inadvertently shut down while your computer is set to answer phone messages. To avoid this, Macintosh Performa computers do not ship with the Auto Power On/Off control panel.

None of the energy-related control panels mentioned here are supported on PowerBook or PowerBook Duo systems.

Auto Power On/Off

This feature lets you set your Macintosh computer to power ON and OFF at a pre-determined time, on a daily basis, or for one particular day. It also has a check box labelled "Automatically restart after power failure". If you check this box and the power goes off, the computer automatically restarts. You can use the Auto Power On/Off feature in conjunction with other System 7.5 features. For example, you could set your system to power on at night and run an AppleScript that re-indexes all of your database files or backs up your hard drive.

This control panel can only be used on computers that can be turned off by using the Shut Down command (soft power off) and that have the "Cuda" ADB controller chip or a version of the Motorola 68HC05 microcontroller chip. The chart at the end of this article lists the Macintosh models this control panel is compatible with.

Note: Not included with all system software prior to System 7.5

CPU Energy Saver

This feature lets you set your Macintosh to turn OFF at a specified time. However, you cannot set your system to turn ON with this feature. It can only be used on computers that can be turned off by using the Shut Down command (soft power off), such as the Quadra 700. This feature is only installed by System 7.5 if Auto Power On/Off is NOT compatible with the Macintosh and CPU Energy Saver IS compatible with the Macintosh.

Note: This control panel did not ship with system software older than System 7.5, although it was released separately before System 7.5. The CPU Energy Saver is not available from Apple software updates online services.

Energy Saver 1.1

This feature lets you set your Macintosh to put external monitors into sleep mode. It was originally designed to work with the built-in video of Macintosh LC III, Quadra 610-950, Power Macintosh, and Performa 450-467, 63x, 611x.

This feature requires an Energy Star-compliant monitor. Compliant models include:

- Apple Color Plus 14-in. Display
- Macintosh Color Display (newer M1198LL/B version)
- Apple AudioVision 14 Display
- Apple Multiple Scan 14, 15, 17, and 20 Displays

Note: Not included with system software prior to System 7.5, although it was made available separately.

This feature did not come preinstalled on some Performa 630- and 6110-series systems and was not included on the backup CDs that shipped with these systems. Customers who want the Energy Saver software can copy it from the disk that comes with the Multiple Scan 15 Display. (Be sure not to copy the Display Enabler extension, since the Performa 630- and 6110-series systems have the Display Enabler's functionality built into the hardware.)

If Energy Saver is installed on a computer that has an incompatible monitor, the monitor goes black after the specified inactivity period has passed, but the incompatible monitor is NOT in low power mode, and therefore is NOT saving energy. Monitors that do not support this Energy Saver function, or monitors that use video cards, are not harmed by the installation of this control panel, but they do not save energy with Energy Saver installed.

The Energy Saver control panel has a slider bar to adjust the monitor inactivity period, from 15 to 60 minutes. Energy Saver can be turned on by clicking the check box nearest the slider bar. The settings take effect immediately; you do not need to restart the computer.

When the Apple Energy Star-compliant monitor has been inactive (that is, you have not used the mouse or keyboard) for the time specified in the Energy Saver control panel, the screen of the monitor goes black. This indicates that the monitor is in low-power mode, and is saving energy. The computer is still functioning.

The monitor returns to a fully active state approximately 20 seconds after you use the keyboard or mouse. You hear a number of beeps while the screen is updated to reflect its current state. (The beep volume cannot be adjusted; it is independent of all system sound controls.)

The Energy Saver control panel is available for download from Apple Software Updates sites. The software is named "Monitor Energy Saver". After download and decompression, you will have the Energy Saver control panel.

Screen

This control panel lets you set your Macintosh computer to put internal monitors into sleep mode.

The Screen control panel can only be used on certain "all-in-one" Macintosh systems, such as the LC/Performa 500-series.

This feature shipped with some Performa 630-series systems and appears to work, but does not really save energy. The Screen control panel should be removed from these systems. Use the Energy Saver control panel in its place.

Energy Saver 2.0/3.0

This control panel combines functionality of CPU Energy Saver, Energy Saver 1.1, and Auto Power On/Off. Energy Saver 2.0/3.0 is compatible only on Power Macintosh computers with PCI slots, which includes the Power Macintosh 5400, 7200, 7500, 7600, 8500, 9500, Power Macintosh G3, and Power Mac G4 series computers.

Note: Energy Saver 2.0/3.0 is available only in System 7.5.2 or later (including Mac OS 8 and Mac OS 9) when used on a PCI-based Power Macintosh computer."

When To Use Which Energy-Saving Control Panels

	For Monitors		For Computer	
	Energy Saver	**Screen**	**Auto Power On/Off**	**CPU Energy Saver**
Compact Macintosh Systems				
Macintosh 128K, 512K, 512Ke, XL	No	No	No	No

Workgroup Server 9150	Yes (2)	No	No (1)	No

Notes:
1 - These Power Macintosh computers included the Connectix Desktop Utility (CDU) software which made these units Energy Star compliant.

2 - Use Energy Saver 2.0.x included with System 7.5.2 for this function.

For additional information on the Energy Star program, see the following articles:

- Article 12346: **Energy Star: Description**
- Article 12345: **Energy Star: Registered Apple Products**

Desktop PrintMonitor: Disabling Manual Feed Dialog

This article discusses how to turn off the manual feed notification that appears when starting a manual feed print job.
This article has been archived and is no longer updated by Apple.
The version of Desktop Printing software being used will determine how the manual feed notification is turned off.

Desktop Printing software prior to version 1.0.3
Turn off Desktop PrintMonitor using the Extensions Manager or remove the desktop printer software. To remove the desktop printer software, refer to the Read Me file for your printer. The Read Me file will also define the steps necessary to use the older PrintMonitor.

Desktop Printing Software version 1.0.3 or later
Desktop Printing Software version 1.0.3 or later will use the PrintMonitor settings for manual feed notification. If manual feed notification is turned off in PrintMonitor, Desktop PrintMonitor's manual feed notification is turned off.

Changing Desktop PrintMonitor
You can change how the Desktop PrintMonitor notifies you about manual feeding, by following the steps below.

1. Hold down the Shift key and restart the computer, keeping the Shift key depressed until the message "Extensions off" or your normal desktop appears.
2. Open System Folder
3. Open Extensions folder
4. Double-click the PrintMonitor application
5. Choose Preferences from the File menu
6. Select preferred Manual Feed options and click OK
7. Close PrintMonitor
8. Restart the computer

This article can help you locate the software update mentioned here:

Macintosh: Video Mirroring Compared To Dual Video

The article discusses the difference between video mirroring and dual video.
This article has been archived and is no longer updated by Apple.
Video mirroring lets you display the same Macintosh image, complete with the menu bar, on two screens simultaneously. The second device can be a monitor, television, or overhead projector depending on the connection you have available. This capability is most useful for those in education or training environments who want to connect large monitors or projection screens to their computer.

Video mirroring is built-in on some PowerBooks, and an add-on option to both the Macintosh LC 580 and Power Macintosh 5200 computers. If you do not have built-in or add-on video mirror support, you can still get the benefits of this type of technology if your computer has a standard DB-15 video-out port, by using the Apple Presentation System or similar products from third party vendors.

Dual Video
Dual video means there are two independent video channels, each with its own dedicated Video RAM (VRAM). On Macintosh computers, this always means there is at least one video card installed. For example, the Power Macintosh 6100 series has built-in video capability, but the addition of a Power Macintosh AV card adds an independent additional video-out capability with a separate amount of VRAM. If you connect one monitor to each port on the Power Macintosh 6100 AV, you would see a "virtual desktop". You could have a window on one screen, your primary display, and a window on the second screen, the secondary display. You can arrange the orientation of the monitors so that the mouse will move between the two monitors at the point where they touch in the Monitors control panel. Only one monitor can display the menu bar, but you can choose which is the main monitor in the Monitors control panel. You do not get two identical images when using dual video.

Due to the highly integrated characteristics of this type of multiple device support, you can theoretically have as many displays as you have slots. You could, for example, populate each available expansion slot on your Macintosh computer with a video card, and have that many monitors creating a large virtual desktop.

There is no processor performance degradation from the use of multiple displays. The relative performance of each display depends on the performance characteristics of the attached video card.

Macintosh: Which Shared Library Manager?

There are 2 extensions in my Extensions folder: the Shared Library Manager and the Shared Library Manager PPC. Does my computer require both files to function correctly, or can I remove one of them?
This article has been archived and is no longer updated by Apple.
Many programs, extensions, and libraries, both by Apple and by other companies, rely on these extensions, and will not function if they are absent.

PowerPC-based computers require both the Shared Library Manager and the Shared Library Manager PPC extensions to be present. You should not remove either of them. This applies to all Macintosh computers with a PowerPC processor, including all Power Macintoshes, the iMac, the iBook, and the more recent Performas and PowerBooks.

Macintoshes with 680x0-series processors (generally manufactured in 1994 or earlier) only need the Shared Library Manager, and do not use the Shared Library Manager PPC.

Apple Remote Access: Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding Apple Remote Access (ARA), with answers to those questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Why does ARA give me an error whenever I launch it?
2. My modem is not on the list of ARA scripts, where can I get the script for my modem?
3. When I use ARA to dial the another computer, it connects for a few seconds, then hangs up.
4. My modem will not connect at high speed. It is a 14.4 kbps modem and I have selected the appropriate modem script, but I can only connect at 9600 bps. What can I do?
5. I'm connected via ARA, but where is the stuff on my other computer?
6. I can see the host network but the host network machines cannot see me. Why is this?
7. Why can my 1.0 ARA not connect to my 2.0 server?
8. Why does my ARA software refuses to launch?
9. I am using AppleShare and ARA and I cannot access my Users and Groups control panel.

Question 1: Why does ARA give me an error whenever I launch it?

Answer: You need to turn on AppleTalk. ARA cannot function without AppleTalk being turned on in the Chooser. It will give a number of artificial errors if AppleTalk is inactive, such as:

- "Every time I try to use ARA, my computer tells me to reinstall. I've tried reinstalling several times, to no avail."
- "I keep getting some sort of weird error on startup or launch of ARA." Common ones are no description, inits turned off, Error number -5555 or larger.
- "AppleTalk Remote Access Setup Error: No Description"

Question 2: My modem is not on the list of ARA scripts, where can I get the script for my modem?

Answer: If your Modem is not listed in the default set of ARA modem Scripts, please contact your modem manufacturer's technical support staff for information on their specific ARA script. Some modem companies provide a Bulletin Board Service (BBS) and others will mail you a modem script.

Question 3: When I use ARA to dial the another computer, it connects for a few seconds, then hangs up.

Answer: This is most likely a script problem. You need to call the manufacturer of your modem, and get the latest script. Refer to the answer above.

Question 4: My modem will not connect at high speed. It is a 14.4 kbps modem and I have selected the appropriate modem script, but I can only connect at 9600 bps. What can I do?

Answer: Make sure you are using a hardware handshake cable. You can check with the modem manufacturer to verify this.

Question 5: I'm connected via ARA, but where is the stuff on my other computer?

Answer: Connecting via ARA is just like being connected to the network. You still need to go to the Chooser, click on AppleShare, select a server, and so on. Do the things you would normally do if you were connected to the network. **Note:** Other computers cannot see you. Refer to the question below.

Question 6: I can see the host network but the host network machines cannot see me. Why is this?

Answer: ARA only acts as a half router, it only goes one way. The caller can see the remote network but the remote network cannot see the callers network. If you want to set up a full router that will join the two networks you need to use the wide area features of the Apple Internet Router 3.0.

Question 7: Why can my 1.0 ARA not connect to my 2.0 server?

Answer: You need to download the ARA 1.0 Client Enabler which will let a 1.0 client call into a 2.0 server. Otherwise, ARA 1.0 is incompatible with 2.0 servers. However, you can put the 2.0 client into compatibility mode and dial into a 1.0 server.

Question 8: Why does my ARA software refuses to launch?

Answer: You need to be using at least AppleTalk version 57.04. Old installers will sometimes install an old version. Just reinstalling using the ARA installer after running an older installer will fix the issue.

Question 9: I am using AppleShare and ARA and I cannot access my Users and Groups control panel.

Answer: ARA uses the same Users and Groups file that is used by file sharing unless you have installed the AppleShare file server. In order to change the users and groups information under AppleShare you must run AppleShare Admin. The users dialog will have an "allow this user to log in" option below the standard preferences information if ARA has been installed. ARA is incompatible with AppleShare 2.0 and with AppleShare Pro.

QuickTime VR: Questions and Answers

Learn answers to frequently asked questions about QuickTime VR and its requirements.
This article has been archived and is no longer updated by Apple.
Question: What is virtual reality?

Answer: Virtual reality describes a range of experiences that let you interact with and explore a spatial environment through your computer. These environments are typically computer renderings of simple or complex computer models. With QuickTime VR, these environments can be based on photographic representations of real locations.

Question: What is QuickTime VR?

Answer: QuickTime VR lets you rotate your view of a scene through a complete 360-degree horizontal circle. Multiple 360-degree views can be linked together to let you travel around in an area. You can move around in space through as many points as the content developer provides. The content provider can also enable certain objects to be virtual as well, letting you view all sides of an object by turning it around using a mouse. The combination of scenes and objects provides an experience that is like being there. As you change your view of the scene, correct perspective is maintained, creating the effect of being at the location and looking around. QuickTime VR is the first mainstream technology to enable theses experiences based on real world scenes.

Question: How does QuickTime VR differ from other VR systems?

Answer: QuickTime VR differs in several ways:

- QuickTime VR uses high-quality photographic representations of a space for the virtual reality experience, a breakthrough in performance and compression technology. There is no need to model and render an existing space.
- QuickTime VR is a software-only implementation; it is an extension of the QuickTime architecture. It does not require additional hardware.
- QuickTime VR's breakthrough is the proprietary software engine that lets you explore real world spaces on most QuickTime-capable personal computers. This differs from most virtual reality systems, which require a very fast 3D computer with specialized hardware that lets the user explore computer generated virtual spaces.
- Easy panoramic image capture; pictures are taken with a standard, 35 mm camera.

Question: What software comprises QuickTime VR?

Answer: The QuickTime VR software technology includes two components:

- QuickTime VR Authoring Studio is a set of QuickTime virtual reality (QTVR) authoring tools that let you create panoramas, objects, and scenes, and manage QTVR projects. Using QuickTime VR Authoring Studio, you can quickly and easily produce professional-quality QTVR media. No programming is required. QTVR creation software is available from third-party software developers as well. See the QuickTime VR site for more information.
- The QuickTime run-time software provides the environment needed to experience QuickTime VR on your computer. You can experience QTVR movies with the QuickTime Player, a web browser using the QuickTime plug-in, or any software application that uses QuickTime APIs (application programming interfaces). QuickTime is available for Macintosh and Windows environments.

Question: Where can the software be obtained?

Answer: The free QuickTime runtime software is available at Apple's QuickTime web site.

Third-party hardware and software for creating QuickTime VR movies can be found at the QuickTime VR Resources page .

Question: What are the system requirements for QuickTime VR Authoring Studio?

Answer: Here are the requirements:

- Mac OS-based computer with a PowerPC processor
- 16 MB of available RAM
- Mac OS 7.5 through Mac OS 9.2.2, or the Mac OS X Classic environment.
- 20 MB of hard disk space
- CD-ROM drive

- Monitor that supports at least thousands of colors
- Video input capability (required for object movies only)

Question: How large are QuickTime VR files? Do I need special equipment to view them?

Answer: QuickTime VR files are exceptionally small, which makes them easy and fast to download without using much computer disk space. In fact, a typical panoramic scene can be as small as 200K. Besides the computer, no additional hardware--such as accelerator boards, helmets, goggles and gloves--is needed to view QuickTime VR scenes.

Question: Where can I download QuickTime VR scenes?

Answer: Try these locations:

- QuickTime VR site
- QuickTime site

DHCP: What Is It?

This article provides some basic information about Dynamic Host Configuration Protocol (DHCP) and how it relates to the AirPort Base Station. This article has been archived and is no longer updated by Apple.
DHCP (Dynamic Host Configuration Protocol) is a protocol that lets network administrators centrally manage and automate the assignment of Internet Protocol (IP) addresses. Its purpose is to enable individual computers on an IP network to obtain their configurations from the DHCP server or servers, in particular, servers that have no exact information about the individual computers until they request the information. This can be used in a LAN environment or by an ISP.

The ability to do this reduces the work necessary to administer a large IP network. Without DHCP, the IP address must be entered manually at each computer, and if computers move to another location in another part of the network, a new IP address must be entered. DHCP lets a network administrator supervise and distribute IP addresses from a central point and automatically sends a new IP address when a computer is connected in a different place in the network, or reconnects to an ISP.

The following definitions will be helpful when setting up the AirPort Base Station for use with your Internet Service Provider:

What is an IP address?

An IP address (also called an IP number) is a number (typically written as four numbers separated by periods, for example 107.4.1.3 or 84.2.1.111) which uniquely identifies a computer that is making use of the Internet. It is analogous to your telephone number in that the telephone number is used by the telephone network to direct calls to you. The IP address is used by the Internet to direct data to your computer such as the data your Web browser retrieves and displays when you surf the Internet. One task of DHCP is to assist in the problem of getting a functional and unique IP number into the hands of the computers that make use of the Internet.

What is a MAC address?

A MAC address (also called an Ethernet address or an IEEE MAC address) is a number that uniquely identifies a computer that has an Ethernet interface. It is typically written as twelve hexadecimal digits, 0 through 9 and A through F, or as six hexadecimal numbers separated by periods or colons, for example, "0080002012ef" or "00:80:0:2:20:ef". Unlike the IP number, it includes no indication of where your computer is physically located. In DHCP's typical use, the server uses a requesting computer's MAC address to uniquely identify it.

What is a DHCP lease?

A DHCP lease is the amount of time that the DHCP server grants to the DHCP client permission to use a particular IP address. A typical server allows its administrator to set the lease time.

Notes

1. This article provides information that did not originate at Apple, Inc. Apple Computer is not responsible for its content. This information is provided for your information.

2. Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

QuickTime VR: Glossary of Terms

This article describes some of the common terms used when discussing QuickTime VR technology.
This article has been archived and is no longer updated by Apple.

Authoring

The process of developing a multimedia title. With QuickTime VR, the authoring process includes four steps:

- Planning
- Capturing images
- Digitizing the images
- Authoring/compositing

Dicing

A QuickTime VR authoring process that compresses source and object PICT files, and creates MooV files. During dicing, PICT files are compressed using a compressor specified by one of the MPW scripts for dicing.

Hot spot

An interactive area in a QuickTime VR movie. Link hot spots allow a movie viewer to navigate from one node to another in the scene. Object hot spots allow a movie viewer to pick up, examine, or get more information about an object in the scene.

MPW

Macintosh Programmers Workbench. Part of the development environment (along with HyperCard) required for authoring QuickTime VR movies.

Navigable movie

A type of VR object that allows you to manipulate a photographically captured or computer-rendered object. Also known as an object movie.

Node

A position in a scene from which you view a 360 panoramic image. Multiple nodes linked together comprise a scene. In a multi-node scene, users can jump from node to node to navigate about the scene.

Object movie

See navigable movie.

Panorama

A 360 photographic view from a position called a node. A panorama is captured for each node in a scene.

Panoramic movie

A VR movie based on a photographically captured 360 node.

Panoramic PICT

A 360 band of blended photographic images, created by the Stitcher.

Photo CD

A compact disc that contains digitized images made from photographic negatives. Photo CD is a Kodak technology.

QuickTime VR

Apple's technology for creating VR experiences. With QuickTime VR, you can create scenes based on high-quality real-world photographic images. QuickTime VR movies can be played back on Macintosh and Windows-based computers; no specialized hardware, software, or accessories are needed.

Scene

An environment for which you create a QuickTime VR movie. Scenes can be photographed or rendered on the computer.

Scene Editor

A QuickTime VR authoring tool that lets you add and position nodes in a scene, link nodes, and link objects to nodes.

Stitching

A QuickTime VR Authoring process that creates a panoramic PICT of blended photographic images of a node.

Title

A multimedia product usually distributed on CD-ROM.

Virtual Reality (VR)

The experience of exploring and interacting with a spatial environment through a computer.

Macintosh 5200/5300/6200/6300: PlainTalk and 16-bit Sound

This article discusses an issue with the Power Macintosh 5200/75 LC computer and Speech Recognition.

This article has been archived and is no longer updated by Apple.
PlainTalk Speech Recognition requires 16-bit sound input in order to work properly. The recently produced versions of the Macintosh LC 5200 and Performa 5200CD and 5215CD computers support 16-bit internal sound as well as 16-bit CD sound. Early production models of Macintosh 5200 series computers support 8-bit internal sound and 16-bit CD sound. However, you can still use the Text-to-Speech feature if your computer only supports 8-bit input.

NOTE: PlainTalk 1.4.1 Speech Recognition is supported on the Macintosh 5200CD family, Macintosh 6200CD family, Macintosh 5300CD, and Macintosh 6300CD computers.

You can use the model number information below to determine whether your computer supports 8-bit or 16 bit sound. Please note that product specifications are subject to change. Check with an Apple reseller for the most current information about product specifications and configurations.

Order Number	Product Name	Sound
M3947LL/A	Power Macintosh 5200 LC 8/500/CD	8-bit
M3917LL/A	Power Macintosh 5200 LC 8/500/CD/VI/TV	8-bit
M3947LL/B	Power Macintosh 5200 LC 8/500/4XCD	8-bit
M3940LL/A	Macintosh Performa 5200CD 8/500	8-bit
M3941LL/A	Macintosh Performa 5200CD 8/500/TV/VI	8-bit
M4110LL/A	Macintosh Performa 5200CD 8/790/14.4	16-bit
M4107LL/A	Macintosh Performa 5215CD 8/1000/14.4	16-bit

If you don't know your model number, you can also use this procedure below to determine if your computer supports 16-bit sound input:

1. Choose Control Panels from your Apple menu.

2. Open the Sound control panel.

3. Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound input radio button is dimmed, you have only 8-bit input, and English Speech Recognition will not work.

   If 16-bit is not dimmed, make sure there is a dot in the radio button next to it.

4. Use the close box in the upper left corner to close the Sound control panel.

For help with installing the PlainTalk 1.4.1 Speech software, see article 18263: "**PlainTalk 1.4.1: Can't Install Recognition on 8-bit Mac**".

Notes:

1. The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

2. The following computers are in the Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

3. Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Mac OS: Assigning more memory to an application program

This article explains how to assign more memory to an application program that is running under Mac OS 9 or earlier.

This article has been archived and is no longer updated by Apple.

You can set up your application to request more memory from Mac OS. Follow these steps to allocate additional memory to an application program:

1. Quit the application if it is open.

2. Locate and click once on the desired application icon on your Macintosh hard disk (not the icon in the Launcher or an alias to the application).

3. Choose Get Info from the File menu.

4. Make sure the Kind: is application program and not folder, alias, or document. If it does not say application program, there is no Memory Requirements area.

5a. For System 7.1 through Mac OS 8.1, select the number next to the Preferred Size box in the Memory Requirements area.

5b. For Mac OS 8.5 through 9.1, select Memory from the Show pop-up menu. (See figure 1)

Figure 1 Show pop-up menu

6. Increase the amount of memory allocated to the application in the Preferred Size box by 25 to 50 percent. (Example: change 1000 K to 1500 K)

7. Close the Get Info window.

The next time the application is opened, the system is asked to allocate the amount of memory in the preferred memory size box. If the system does not have the requested free RAM available, it tries to allocate a progressively decreasing amount of RAM until it decreases to the amount in the minimum requirements box in the Get Info window. If the amount of free RAM available falls below the minimum, the system reports there is not enough memory open the application.

Apple Ink-Jet Printer Supplies

This article contains a list of Apple ink-jet (StyleWriter) printer supplies, and some third-party replacement equivalents.
This article has been archived and is no longer updated by Apple.
Damage to the printer caused by the use of third-party printhead cartridges or ink refill kits that do not meet Apple's rigid standards will void the warranty.

Although not supported by Apple, the use of Canon, Hewlett-Packard, or other third-party cartridges and ink refill kits that meet Apple's rigid specifications do not void the Apple warranty. Canon and Hewlett-Packard cartridges and tanks are the only third-party equivalents that are approved by Apple. Apple does not make public its testing procedures.

For best print quality, Apple recommends using the Apple Ink Cartridges and Ink Tanks for any of Apple's ink-jet printers.

How to clean up fuser oil of a Color LaserWriter 12/600 PS printer

What should I use to clean fuser oil that has spilled onto my Color LaserWriter 12/600 PS?
This article has been archived and is no longer updated by Apple.
The Color Laserwriter 12/600 PS and Color LaserWriter 12/660 PS printers uses a silicone based oil that can easily be cleaned up from the exterior plastic case using a lint free cloth and a mild non-abrasive household cleaner/degreaser such as Fantastik or 409. Spray a small amount of the cleaner onto the cloth and wipe the plastic case. Do not allow any cleaning solution to enter into the printer.

Oil that has spilled onto the photoconductor, transfer drum, or paper feed rollers can be cleaned by printing on lint free paper until all of the oil is absorbed. Usually anywhere from 5 to 50 sheets of paper will remove the oil. Do not use ammonia- or alcohol-based cleaners on or near the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS printers.

To prevent damage to the photoconductor, do not touch or use any cleaning materials on the delicate gray roller that is the photoconducting surface.

The photoconductor may be damaged from scratches or contamination due to oil or fingerprints. Image quality defects in the printed output may result with areas of light print, scratches or banding that repeat vertically down the page every 5.07" (129mm). The defects are typically visible in areas that have toner applied to them.

Mac OS: -39 or -192 Error Opening Launcher

This article describes an issue that causes an error when you open the Launcher.

This article has been archived and is no longer updated by Apple.

Symptom

An error message stating: "The control panel Launcher could not be opened because of error type -192." appears when the Launcher is opened. Error -39 may also appear. If the Launcher is reinstalled, it works fine for a few days, but the symptom returns.

Solution

When a control panel is opened, the Finder adds a resource to the control panel that stores the window position. This is so that the control panel window opens in the same place the next time it is opened.

The addition of this resource to the Launcher can cause the Launcher to function incorrectly. To correct this, follow these steps:

1. Start up the computer from the Mac OS Install disc.
2. Find the Launcher Items folder in the System Folder of the hard disk.
3. Drag the Launcher Items folder out of the System Folder to the hard disk. **Do not throw it away.**
4. Locate the Launcher Preferences in the Preferences folder, which is in the System folder on the hard disk.
5. Drag the Launcher Preferences file to the Trash.
6. Locate the Launcher in the Control Panels folder, which is in the System folder on the hard disk.
7. Drag the Launcher to the Trash.
8. Perform a custom installation of the Launcher from Mac OS Install disc. For more information on this procedure, please see article 31288: "**Mac OS 9: Installing or Removing Individual Components**"
9. Open the Control Panels folder in the System Folder on the hard drive and select Launcher.
10. Choose Get Info from the File Menu.
11. Choose General Information from the pop-up menu.
12. Click Locked. Selecting the Locked option prevents the Finder from modifying the file.
13. Start up the computer from the hard disk.
14. Open the Launcher.
15. Close the Launcher.
16. Drag the Launcher Items folder from the hard disk back into the System Folder on the hard disk.

MacPPP Access: Modem Initialization Strings

This article lists some modem initialization strings for MacPPP using point-to-point protocol (PPP) access. This article does not have initialization strings for every modem, only those which the modem vendor provided to Apple.
This article has been archived and is no longer updated by Apple.

MacPPP ships with Apple Internet Connection Kit (AICK) and requires you to know your modem's initialization string. Many initialization strings are listed in the AICK setup, however, if your modem is not listed, you should consult your modem manual, or contact your modem vendor, or check with your Internet Service Provider.

Apple Printers: LaserWriter Support Under Windows 95

What Apple LaserWriters are supported under Microsoft Windows 95?
This article has been archived and is no longer updated by Apple.
Microsoft Windows 95 ships with PostScript PPD files for most Apple LaserWriters including:

Apple LaserWriter
Apple LaserWriter Personal NT
Apple LaserWriter II NTX
Apple LaserWriter IIf
Apple LaserWriter IIg
Apple LaserWriter Plus
Apple LaserWriter Pro 600
Apple LaserWriter Pro 630
Apple LaserWriter Pro 810
Apple LaserWriter Select 360
Apple Personal LaserWriter NTR

These PPD files were created and are supported by Microsoft.

Apple provides Windows 95 drivers online for the following LaserWriter printers:

LaserWriter 8500
LaserWriter 12/640
LaserWriter 16/600
LaserWriter Pro 630
LaserWriter Pro 600
LaserWriter Select 360
Color LaserWriter 12/660 PS
Color LaserWriter 12/600 PS

Some Apple LaserWriter printers not listed above may work fine under Windows 95 by selecting another printer from the lists above.

These articles can help you locate the PPD software for the Color LaserWriter 12/600 PS and LaserWriter 16/600 PS mentioned here:

- Article 14724: "**Where To Find Apple Software Updates**" - Lists online services for free Apple software updates.

Mac OS: Reblessing Old System Folder After Clean Install

This article describes the process for possibly reactivating (re-blessing) the original system folder, after a clean installation, if the original System Folder was not thrown away.
This article has been archived and is no longer updated by Apple.
Startup Disk version 9.2 and later allow you to easily switch between System Folders on the hard disk volume. Startup Disk 9.2.1 is available from Apple Software Downloads (http://www.apple.com/swupdates/).

If you are using Mac OS 9, consider using this version of Startup Disk to more easily select and change the active System Folder.

If the steps listed below do not work, you will have to reinstall system software, then complete the steps listed in your clean install instructions.

Note: The following instructions are applicable to Mac OS 8 as well.

Due to the wide variety of situations a clean restore can be used to troubleshoot, be sure to read the instructions below carefully, in order to determine whether your overall initial issue would benefit from this procedure. If you are troubleshooting SCSI issues in particular, make sure you have resolved those issues before proceeding. If you are not sure, do not follow these steps.

To re-bless your System Folder:

1. Start the computer from an external floppy disk or a startup CD.

2. Close all your windows, then open your hard disk.

3. Choose by Name from the View menu. Verify that the System Folder has a small picture of an original Macintosh in the middle of its icon. This will resemble a picture of a monitor. This is the currently blessed system folder that is running your computer.

4. Open this System Folder. Move the System suitcase into the Preferences folder. Close the System Folder.

5. Verify that this System Folder no longer has the original Macintosh icon.

6. Rename the System Folder Clean System Folder.

7. Rename the original System Folder (the one you wish to use again, not the one from Step 6) back to System Folder.

A. If you used System 7.5's Clean Install option, open the System Folder, double-click on your System suitcase. Close the window which appears, then close the System Folder.

1) If a picture of an original Macintosh does not appear in the middle of this folder's icon, open the System Folder again.

2) Drag the System suitcase and the Finder to your hard disk icon.

3) Close the System Folder.

4) Open your hard drive and drag the System suitcase and the Finder on top of the System Folder icon. The original Macintosh icon should appear on the System folder immediately.

B. If you used another type of clean restore, you ordinarily would have had to separate the System suitcase and the Finder from each other. One of these files would have been placed in the Trash, or in your Preferences folder, or someplace other than loose in the System Folder. You need to find the System suitcase and the Finder, move them to your hard disk, close your System Folder, and drag them on top of your System Folder icon. The original Macintosh icon should appear on the System Folder icon immediately.

8. Restart your computer. It should start up from the original System Folder. If it does not, repeat the original clean install steps.

9. Put Clean System Folder into the Trash and empty the Trash. You will lose all data in this System Folder, so make sure that you have not installed any software in that System Folder except for the basic system software.

Energy Saver Control Panel: Sleep and Power Management

This article provides details about the "Sleep" and power management functions of the Energy Saver control panel shipping with the Power Macintosh 7200, 7500, and 8500 series computers.

Questions answered in this article:

1) Is the central processing unit (CPU) still responsive when the Energy Saver control panel spins down the hard disk in sleep mode?

2) Is it possible to spin down the hard disk, but not put the monitor into sleep mode?

3) Can the Energy Saver control panel spin down any hard disk attached to the SCSI bus, or only the startup disk?

4) When does the Energy Saver control panel begin the countdown before putting the computer to sleep or shutting down? Is there a specified delay, or does the countdown begin as soon as the computer is idle?

5) If the computer is in sleep mode, and a fax call comes in (assuming the fax software is set to receive faxes), does my computer wake up and receive the fax?

This article has been archived and is no longer updated by Apple.

1) Question: Is the central processing unit (CPU) still responsive when the Energy Saver control panel spins down the hard disk in sleep mode?

Answer: While in sleep mode, the CPU responds to mouse, keyboard, and serial port activity. If an activity requires disk access, the hard disk is spun up.

2) Question: Is it possible to spin down the hard disk, but not put the monitor into sleep mode?

Answer: Yes, it is possible for the hard disk to spin down even though the monitor is not in sleep mode. When the hard disk is spun down, the arrow is unresponsive (as if the system is unresponsive), but pressing a key spins the hard disk back up. However, there is a delay before the drive spins back up, and there is no notification that the drive is spinning back up.

3) Question: Can the Energy Saver control panel spin down any hard disk attached to the SCSI bus, or only the startup disk?

Answer: The Energy Saver control panel may or may not spin down all hard disks attached to the SCSI bus. Apple has not tested The ability to spin down a hard disk is dependent on the formatting software used on the hard disk. In limited testing, the Energy Saver control panel has spun down external drives formatted with Drive Setup.

4) Question: When does the Energy Saver control panel begin the countdown before putting the computer to sleep or shutting down? Is there a specified delay, or does the countdown begin as soon as the computer is idle?

Answer: The countdown to shutdown or sleep begins as soon as the computer is idle. Your computer is idle if when all of the following conditions are met:

- No Apple Desktop Bus (ADB) routines other than routine monitoring of the bus
- No Input/Output (I/O) calls to firmware (Read, Write, Control, Format, Status)
- No changes in the cursor (for example, the rotation of a hand in the clock icon)
- No post-event calls (for example, a call resulting from insertion of a disk)
- No communication through the serial port

5) Question: If my computer is in sleep mode, and a fax call comes in (assuming the fax software is set to receive faxes), does the computer wake up and receive the fax?

Answer: A modem that uses the serial port's 'wake on ring' pin setting, and that has software that reads it, can wake the CPU from sleep. The GeoPort Telecom Adapter from Apple features this capability. Depending on background activity, some fax software may keep the CPU busy and not allow the computer to enter "sleep" mode.

StyleWriter Printers: How to generate a test page

This article explains how to generate a test page with some of the StyleWriter family printers.
This article has been archived and is no longer updated by Apple.

StyleWriter

1. Turn printer off.
2. Press and hold the Form Feed button.
3. Press the Power button and release both the Form Feed and Power buttons simultaneously.

Portable StyleWriter

1. Turn printer off.
2. Press and hold FWD ADJ and REV ADJ buttons.
3. Press and hold Power button. Wait for a single beep and release the power button.
4. Wait for another beep and release the FWD ADJ and REV ADJ buttons.
5. Immediately press the LF/FF button.
6. The Portable StyleWriter prints a small test pattern.

StyleWriter II
StyleWriter 1200
Color StyleWriter Pro
Color StyleWriter 2200
Color StyleWriter 2400

1. Turn printer off.
2. Make sure the printer has paper loaded.
3. Press and hold power button.
4. Release power button when orange light turns off.

Color StyleWriter 2500

1. Turn printer off.
2. Turn printer on.
3. Hold down the online key for at least 6 seconds or until the test page prints.

Color StyleWriter 4100

Generating a Test Page: The test page for the Color StyleWriter 4100 is built-in.

1. Make sure the printer is turned on.
2. With the printer's power light on, press and hold down the power button.
3. Then press once(hold briefly) the resume button.
4. Release the power button.

5. The power light should start to blink, and continue until the sample print is completed.

Color StyleWriter 4500

Generating a Test Page: The test page for the Color StyleWriter 4100 is built-in.

1. Make sure the printer is turned on.
2. With the printer's power light on, press and hold down the power button.
3. Then press once(hold briefly) the resume button.
4. Release the power button
5. The power light should start to blink, and continue until the sample print is completed.

Color StyleWriter 6500

Generating a Test Page: The test page for the Color StyleWriter 6500 is built-in.

1. Make sure the printer is turned on.
2. With the printer's power light on, press and hold the resume button until the orange light goes out.

UUencode & UUdecode: Explained

This article describes UUencoding and UUdecoding, a popular method to transfer binary information on the Internet.
This article has been archived and is no longer updated by Apple.

What is UUencode?
UUencode stands for Unix-to-Unix Encode. It is a text-based binary encryption protocol in wide use on the Internet to transfer files across multiple platforms including UNIX, Windows, MS-DOS, Macintosh, and other operating systems. UUencode is the UNIX name for the encryption program; it is normally used with another UNIX program, UUdecode, which decodes an encrypted message.

Why UUencode files?
The basic idea behind UUencoding a file is to translate a binary representation of data -- which could be a graphic image, compressed file, or other type of binary data -- into an encrypted text representation of that file.

There are two reasons for doing this:

1) Many mail systems used on the Internet cannot handle binary transmissions since they are designed for text data. However, if a file is UUencoded, it can be included as text in the message.

2) Many mail systems and gateways have size limitations, often less than 50 kilobytes (K). It is sometimes necessary to use a text editor to split or combine such files. Since a binary representation of that data would make the editing of data very difficult, and since software that automatically joins these binary files is relatively rare, UUencoding a binary file allows common text editors to be used to join such files.

How can you tell it's a UUencoded file?
There is no standard file name convention, although most UNIX-based systems use a .uu as a suffix. DOS-based computers, with their standard three-digit suffixes, generally use .uue. This is one general method of telling whether or not it is a UUencoded file. Another method is actually looking at the first line of the file.

A UUencoded file can be identified by the first line of the file:

-> begin 644 myfile.gif

This line is followed immediately by the start of the data. The first character of every line is the letter M. If the file has other characters other than M, the file is either not a UUencoded file, or has been damaged:

-> MuVAA=baI<RabzvYHyw@_cpUbzvYHyw@@zwl@xF]TzbaAhgmE=baOyBaA<gaL

The block ends with a single line containing the statement:

-> end

The first line signals the start of the block. The number 644 is a UNIX permissions flag (in this case, giving the owner of the file full read and write permissions) while giving other users read permissions only). The third part is the file name that uudecode will expand the file as.

What are the versions of UUencode?
UUencode is a standard, but a number of implementations of the software exist. Most implementations are based upon source code from versions of the UNIX software which are in the public domain.

Macintosh and most Windows versions tend to combine both the UUencode and UUdecode functions into a single program, and simply allow you to choose if you want to encode or decode a message.

What issues should I be aware of?
UUencoded data should be line-terminated with a single carriage return. Some mail systems append multiple line feeds or carriage returns, which can confuse some implementations of UUdecode.

UUencode is intended for use with a straight binary file. Since Macintosh files contain both a data fork and a resource fork, you should use Binhex to send Macintosh binary files. There are some types of files that you can UUencode, but you should limit these to files you know are going to other people using different operating systems.

Types of Files You Can UUencode

- Graphics (includes GIF, JPEG, and TIFF files)*
- Word processing files
- Miscellaneous non-Macintosh specific files

* PICT files are Macintosh based, so you should use Binhex to transmit these types of graphics.

Type of Files You Should Not UUencode

- Applications
- Control panels
- Extensions
- Fonts
- Macintosh-specific compressed files (StuffIt, Compacter)

Note: You should use Binhex to transmit these types of files.

UUencode and UUdecode Tips

- Do not imbed "white space" in the file. The first line of the file should start with the begin line and the last line of the file should be the end statement.
- If you UUencode a file, the only to determine if your file starts with begin and finishes with end is to open it in a text editor or word processing application and check it.
- If a message was received as multiple email messages, intervening message headers and "white space" should be removed. Some UUdecode utilities cannot handle the additional returns and headers.
- Since there are a large number of UUencoding and UUdecoding applications on various computer platforms, you may get some errors during the decoding process.
- If you encounter errors decoding a file and are sure the source (input) file is correct, try a different UUdecoding utility. If the errors persist, have the sender of the data encrypt the data using a different version of UUencode.

LaserWriter Printers: Available Line Screens

This article provides the line screen for all Apple LaserWriter printers, plus some common questions about line screen and printers
This article has been archived and is no longer updated by Apple.

Line Screen of Apple LaserWriter Printers

Here are the default line screens for Apple LaserWriter printers. These values are taken from the PPD files. Many applications such as Quark Xpress, PageMaker, and Illustrator allow you to change the line screen since these applications create their own PostScript code.

Model	LPI	Screen Angle
LaserWriter	60	45 degrees
LaserWriter Plus	60	45 degrees
LaserWriter IINT	60	45 degrees
LaserWriter IINTX	60	45 degrees
LaserWriter IIf	60	45 degrees
LaserWriter IIg	106	45 degrees
LaserWriter Pro 600	85	45 degrees
LaserWriter Pro 630	85	45 degrees
LaserWriter Pro 810	60	45 degrees
LaserWriter Select 360	85	45 degrees
LaserWriter 4/600	106	45 degrees
LaserWriter 16/600 PS	106	45 degrees
Color LaserWriter 12/600 PS	200/141	-
Color LaserWriter 12/660 PS	200/141	-
Personal LaserWriter NT	60	45 degrees
Personal LaserWriter NTR	60	45 degrees
Personal LaserWriter 320	53	45 degrees

Common Line Screen Questions

Question: Is line screen dependent on DPI or the printer? - meaning will
every 300 DPI printer have the same line screen.

Answer: Not necessarily. There are two different issues here:

1) Line screen IS partially dependent on dpi, and enhancements like PhotoGrade.

2) The line screen on any printer can be changed with programs that generate their own PostScript.

Two 300 dpi printers can have the same line screen, however, may produce different results if one has PhotoGrade; PhotoGrade technology in effect increases dpi.

Line screens (LPI) are based on the number of horizontal dots in a halftone cell and the printer's DPI. Thus, a halftone cell of 2x2 has 2 dots horizontally which provides a 150 line screen on a 300 DPI printer, or a 300 line screen on a 600 DPI printer. A halftone cell of 1x1 has 1 dot horizontally, so produces a 300 line screen on a 300 DPI printer, or a 600 line screen on a 600 DPI printer. Note that line screens equal to the printer's DPI are only useful when printing text since the levels of gray equals 2, black and white -- gray value of 2 is calculated by the following:

((300/300)**2) + 1, or ((600/600)**2) + 1.

Note:
The maximum line screen can never exceed the dpi of the printer
(for example, 300 LPI maximum for a 300 DPI printer), and programs such as Quark Xpress only allow certain line screen values between 15 and 400.

Question: Is line screen a fixed number on the printer, or can all printers print at different line screens?

Answer: Line screen is changeable on most all Apple printers. In our tests with the LaserWriter IINTX, for example, you are able to change the line screens to values like 15 LPI, 50 LPI, and 61 LPI and observe noticeable changes - greater levels of gray. On older printers like the LaserWriter IINTX, changing the line screen to greater than half of the dpi (for example >150 LPI on 300 DPI printers) resulted in no noticeable change. These printers have a "threshold" value that they do not exceed. For most of the older 300 DPI printers, the threshold line screen is 150 lpi since that provides 5 levels of gray ((300 DPI/150 LPI)**2) + 1. Any line screen value above 150 for a 300 DPI printer would produce less than 5 levels of gray (which the printer's ROM deems as useless), so the printer does not go beyond a 150 line screen.

Line Screen Summary
==========

The following relationship best summarizes what LPI really means:

* Increased LPI results in increased resolution, but decreased levels of gray.
* Decreased LPI results in decreased resolution, but increased levels of gray.
* Basically, as lpi approaches dpi, resolution is increased but the number of dots in a halftone cell decrease, resulting in less number of grays.

The best way to see all of these effects is by printing a picture of a person's face with some large text in the background, at 50 LPI and 100 LPI on a printer like the LaserWriter Pro 630.

Open Transport and PPP: Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding Open Transport and Point-to-Point Protocol (PPP), with answers to those questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Is Open Transport compatible with existing Internet Service Providers?
2. Which mdevs are currently supported?
3. Doesn't Apple offer a solution for SLIP or PPP dial-up to the Internet?
4. Does the Apple Internet Connection Kit require Open Transport?
5. If I need an updated copy of one of these mdevs, how can I get the software?
6. Are there other known limitations to backward compatibility mdev support?
7. Is there documentation available to assist with configuring Open Transport/TCP?
8. What additional updates are planned for Open Transport to improve compatibility with dial-up internet access?
9. When will Open Transport 1.1 be available?
10. Will Apple provide a SLIP or PPP solution for Open Transport?

Question 1: Is Open Transport compatible with existing Internet Service Providers?

Answer: Open Transport/TCP currently supports dial-up connectivity to TCP/IP networks, including the Internet, through backward compatibility with select third party software models know as "mdevs".

With the appropriate mdev software installed, end-nodes can use either Serial Line Internet Protocol (SLIP) or PPP to connect to Internet Service Providers and other dial-up IP-access points. However, not all versions of all mdevs are supported by Open Transport backward compatibility services. It is important that the recommended versions of software be installed for the greatest level of compatibility.

Question 2: Which mdevs are currently supported?

Answer: Open Transport 1.0.7 works with the following MacTCP Link Access Modules (mdevs), with these known caveats.

- FreePPP - version 1.0 or more recent; compatible with Open Transport.
- InterSLIP - Version 1.0.1 is not compatible with Open Transport, you need a later version. InterCon should be contacted directly.
- InterPPP - use version 1.2.9 or more recent.
- InterPPP II - use the most current version.
- MacSLIP - use version 3.0 or more recent; compatible with Open Transport.
- MacPPP - use version 2.1.3sd or more recent (2.2.0 not recommended).

Apple is continuing to work with developers to better support existing mdevs; contact the third party developer of interest for the most recent information on compatibility.

Question 3: Doesn't Apple offer a solution for SLIP or PPP dial-up to the Internet?

Answer: The Apple Internet Connection Kit is a selection of the most popular Internet applications from third party companies, including the Netscape Navigator and RealAudio Player from Progressive Networks, as well as Claris Emailer Lite.

The kit includes MacPPP 2.1.4 along with the Apple Internet Dialer - software designed to make it simpler for Macintosh customers to register with a qualified Internet Service Provider (ISP) and get connected to the Internet. To help users work with their Internet applications, the Apple Internet Connection Kit includes Apple Guide software for on-line assistance.

Question 4: Does the Apple Internet Connection Kit require Open Transport?

Answer: No, the Apple Internet Connection Kit works with either MacTCP 2.0.6 or with Open Transport/TCP 1.0.7 or later.

Question 5: If I need an updated copy of one of these mdevs, how can I get the software?

Answer: Sources for mdev software will vary, as some of the recommended products are commercial and some are shareware or public domain.

- FreePPP is shareware and can be found on a variety of internet sites; typically at "info-mac" mirror sites in the comm/tcp directory.

Question 6: Are there other known limitations to backward compatibility mdev support?

Answer: Yes. Due to differences in the underlying architectures between MacTCP and Open Transport/TCP, and some current shortcomings in the backward compatibility services, there are some additional limitations to mdev support:

- Some mdevs, when used with Open Transport, may not be able to auto-dial, that is, automatically connect to the service provider when launching a TCP/IP application. This is being addressed by updated versions of mdevs.

- Some Internet Service Provider do not strictly follow standards practices, which call for assigning end-node IP addresses on the same subnet as the router (gateway). Open Transport strictly enforces this requirement in versions prior to 1.0.7. Beginning with Open Transport 1.0.7, the TCP/IP configuration utility software will automatically generate a compatible router address to facilitate connectivity to the ISP if the user leaves the router address field empty.
- Once a TCP/IP application launches and uses a SLIP or PPP mdev, use of a different mdev may require restarting the Macintosh. Disconnecting from and redialing a service provider may also require restarting the Macintosh. This is planned to be addressed in Open Transport v1.1.

Question 7: Is there documentation available to assist with configuring Open Transport/TCP?

Answer: Yes. Although a full user's guide is planned for release with Open Transport v1.1, configuration tips for Open Transport 1.0.x are already available on various sites.

Question 8: What additional updates are planned for Open Transport to improve compatibility with dial-up internet access?

Answer: Open Transport 1.1 is planned to include:

- Support for reconnection of a dial-up session without restart.
- Fix for a compatibility problem that could interfere with Qualcomm Eudora users sending short messages.

Question 9: When will Open Transport 1.1 be available?

Answer: Open Transport 1.1 is already available. In fact, version 1.1.2 was posted to Apple Software Update sites on December 13, 1996

Question 10: Will Apple provide a SLIP or PPP solution for Open Transport?

Answer: Apple is developing an implementation of PPP for Open Transport as a part of the next generation of Apple Remote Access products. This is planned to support dial-up access to both AppleTalk and TCP/IP networks. Additional details will announced at a later date.

Note: Some urls that are included with the Read Me have been removed from this article. Please visit the Open Transport Developers web site for up-to-date information on this software:

Power Macintosh: Type 11 & No FPU Errors Technote

This Technote explains some of the causes of "Type 11" and "No FPU Installed" errors, along with debugging hints to help you find and fix them. It also focuses on what you as a programmer can do to prevent such errors.
This article has been archived and is no longer updated by Apple.
Both Type 11 and No FPU Installed errors occur on Power Macintosh computers, depending on various factors. Both error messages are the result of programming errors. The No FPU Installed error usually means that your program is executing data rather than instructions. The Type 11 error is any error (such as a bus error) in native code.

Note: In this Technote, I will occasionally mention third-party products by name. If a third-party product is mentioned by name, it's meant to be a possible solution for you to investigate, not a recommendation. DTS (Developer Technical Support) doesn't evaluate third-party tools, nor maintain complete lists of possible third-party solutions. You should consult catalogs of development tools.

See technical document 16004 "**Power Macintosh: Meaning of Error Type 11**" for specific end-user troubleshooting information.

About "No FPU Installed" Errors

On a Power Macintosh computer, the error message No FPU Installed usually means your code has jumped to a non-code area and is executing garbage. Somewhere in that data (which is being interpreted as instructions) is an instruction whose op code begins with the hex value F. No FPU Installed is equivalent to a Type 10 Error ** i.e., your program has attempted to execute an unknown instruction op code starting with the hex value F.

On a Power Macintosh, No FPU Installed means that some program has jumped to an area of data and has tried to execute any data word starting with the hex value F. The PowerPC chip has floating point support built in, but that floating-point support is different from the Motorola 680x0 family floating- point support. The Motorola 680x0 family uses an external floating-point unit. (There are also external memory management units (MMUs) and other specialized coprocessors.) Motorola 680x0 CPUs use instructions starting with hex value F as instructions for these coprocessors.

680x0 Microprocessor Instructions

All Motorola 680x0 microprocessors have instructions consisting of at least one word (the operation word); some instructions can have up to eleven words (see the Motorola MC68020 32-bit Microprocessor User's Manual, Third edition, page 3-1.) The operation word determines what kind of instruction is to be executed. For example, the instruction

MOVE.B D1, D2

translates to the hexadecimal value

1401

This instruction starts with the hex value 1. The instruction

FMOVE.X FP3,-(A7)

translates to

F227 6980

This instruction starts with the hex value F.

F-line Instructions

The Motorola 680x0 architecture was originally designed to support a floating- point coprocessor chip. This chip, the Floating Point Unit (FPU), communicates with the CPU via a special set of instructions called F-line instructions. These instructions always start with an operation word beginning with the hex value F.

A program can be compiled to take advantage of the hardware assistance the FPU provides, and thus yield faster floating-point calculations than would be available with SANE (the Standard Apple Numerics Package). Such programs would have instructions in the program which start with the hex value F. A program only using SANE would never have an instruction starting with the hex value F.

Note: Some Macintosh models, such as the Macintosh SE/30, the Macintosh IIci, and the Macintosh IIfx, shipped with an FPU coprocessor installed. Other 680x0-based Macintosh computers, such as the Macintosh IIsi and the Macintosh Color Classic, had an optional FPU coprocessor. For these machines, it was possible to purchase an optional card with an FPU coprocessor.

68040 & 68040LC Microprocessors

With the introduction of the 68040 and 68040LC chips, things got a bit more complicated. The 68040 microprocessor has most of the 68882 FPU included on the chip. Not everything in the 68881/68882 FPU is in the 68040 chip, however ** just the routines that Motorola determined were most frequently used. The rest of the FPU routines are automatically emulated by software. Because the FPU is "built-in," as it were, the 68040 chip handles instructions that start with an operation word beginning with the hex value F by itself. There is no way to add a coprocessor to a 68040 chip; the instructions are never brought out of the chip itself.

The 68040LC is a cost-reduced version of the 68040 chip. Savings came about by removing the FPU portion of the chip. Not only does a 68040LC chip have no FPU, there is no way to add one.

The Power Macintosh

Power Macintosh computers emulate a Motorola 68040LC, i.e., a machine without FPU support. When you get a bomb with the message No FPU installed, it means some instruction has been executed with an operation word starting with the hex value F, and that your program is running on a machine without a FPU. This machine could be one of the following:

* a Macintosh with a 68020 or 68030 microprocessor and no FPU coprocessor
* a Macintosh with a 68040LC microprocessor (which can never have a FPU)
* a Macintosh with a PowerPC chip running 68K code in emulation (since the 68K emulator emulates a 68040LC microprocessor).

Power Macintosh computers contain very fast floating-point support as part of the CPU. This floating-point support is different from the floating-point support provided by the Motorola 680x0 microprocessors. Inside Macintosh:PowerPC Numerics, describes Power Macintosh floating-point support.

Defining a Type 11 Error

A Type 11 error means an illegal interrupt vector on a 680x0 machine. On a Power Macintosh, a Type 11 error is any exception in native code not handled by one of the installed exception handlers. On a Power Macintosh, a Type 11 error can be almost any error that occurred in native code. Type 11 errors may include:

* an address error
* a bus error
* an illegal instruction error that occurred in native code.

The exception handlers installed for native code don*t correctly handle the particular condition which was raised, and the error is returned back to the System Error manager via the Mixed Mode manager. The System Error manager maps all such exceptions to the system error Type 11 Error.

If you install Macsbug 6.5.2 or later, some Type 11 errors may be reported as a PowerPC unmapped memory exception. This is equivalent to a bus error, i.e., an error indicating your program is accessing memory that doesn*t exist.

The Modern Memory Manager was designed to be less forgiving than the classic (68K) Memory Manager. Disposing of something twice, disposing of memory that was never allocated, and other memory handling problems will often generate a Type 11 error, while on a 68K machine the problem may go unnoticed.

Programming Mistakes Causing Type 11 Errors

The following sections give you examples of programming mistakes that may cause Type 11 errors.

Example #1: Writing Past the End of an Array

Writing past the end of an array can be a subtle and difficult-to-find bug. Example #1 shows you why.

```
;=========
;Begin C Code
;
void IAmGoingToCrash(void)
{
Str27 badArray;
BlockMoveData("\\pThis string is too long for this array", badArray, 39);
```

```
}
;
;End C Code
;=========
```

NOTE: I've made the bug very obvious; it may not be quite so obvious, however, in your code. In this example, I*ve put a string of 39 characters into an array defined to hold 27 characters. This overwrites the stack, which contains such useful things as your return address. On a 68K Mac, this causes a bus error. On a PowerPC Mac in 68K emulation, this causes a bus error. On a Power Macintosh in native code, this causes a Type 11 error.

Example #2: Using a Poorly Initialized Pointer or Handle

If your program tries to use an uninitialized or badly initialized pointer, it can generate a Type 11 error. Here is what happens in Example #2:

```
;=========
;Begin C Code
;
Ptr badPointer = (Ptr)-2;
*badPointer = 0;
;
;End C Code
;=========
```

NOTE: I've made the bug very obvious; it may not be quite so obvious, however, in your code. In this example, I*ve created a pointer to non-existent memory (-2 isn*t a valid address) and then tried to access the memory to which the pointer refers. On a 68K Mac, this causes a bus error. On a PowerPC Mac in 68K emulation, this also causes a bus error. On a Power Macintosh in native code, this causes a Type 11 error.

Other Situations Causing Type 11 Errors

The following sections document some of the known bugs in various products that may cause Type 11 errors.

Color Picker vs Third-Party SCSI Drivers

One reproducible problem stems from a known bug in several third-party SCSI hard disk drivers. The bug causes the Color Picker to crash when trying to resolve a boot volume alias it makes at startup time. This problem exists in any system when Color Picker 2.0 or 2.0.1 is installed and the boot volume is not a removable drive. The fundamental cause of the problem is that the SCSI driver incorrectly marks the boot drive as a removable drive during the boot process and changes it to be properly marked as a fixed device after startup. To find its code, the Color Picker resolves the boot volume alias it made during startup. Since the alias passed to the Alias Manager is for a removable drive, the Alias Manager can*t resolve the alias (since the device is now marked as fixed.) The Color Picker design did not anticipate the boot volume not being found. This results in a Type 11 error. The fix is to upgrade your SCSI driver to a later version.

Calling a Routine That May Move Memory at Interrupt Time

The Apple Media Kit, release 1.2, had a problem that could cause random errors. During a VBL task, AMK was calling SetCCursor. SetCCursor can possibly move memory. Moving memory during interrupt time is a very bad idea. The Memory Manager may be in an unstable state, such as compacting memory, when an interrupt routine gets called. This can cause a Type 11 error in native code.

A replacement cursor.c file has been provided in the Apple Media Tool/Programming Environment Runtime folder, and we do have a replacement Runtime Maker:Codes:Program file for Apple Media Tool. If you are currently developing titles, replacing these files and rebuilding your projects will remove the bug.

Not Enough Heap Space

There are some situations where having small amounts of memory available in the system heap may lead to a Type 11 error. As an example, if the shared library manager can't load a shared library, you may get a Type 11 error. This can happen when QuickTime tries to load a decompressor for certain kinds of images.

Writing Past the End of an Array

In OpenTransport 1.0.5 or earlier, there was a bug in the TCP/IP control panel code that could corrupt memory if there were more than 256 zones and a MacIP server was found in a zone past the 256th zone. Under these conditions, the control panel code wrote past the end of one of its buffers. This bug would manifest itself if the user opened the select zone dialog and the TCP/IP control panel was left open long enough for the

NBP lookup calls for zones past the 256th zone to complete. This is corrected in OpenTransport 1.0.6 and later, but is given here as an example of a Type 11 error.

Insufficient Stack Space

Heavy use of local variables or recursion may cause your program to run out of stack space. When this happens, you may have crashes that are difficult to track down. Increasing your program*s stack is one solution. Whenever you are using a large number of local variables or recursive routines, you should increase your program's stack (using the procedure listed in Inside Macintosh: Memory on page 1-40).

As an extreme example, a faceless background application (documented in Technical Note PS 2) has only a 2K stack by default. A 68K application has 24K of stack on most modern machines (8K if no Color QuickDraw is installed, 32K if A/UX is installed.) You can use the low memory accessor function LMGetDfltStack to find your current stack size. Native QuickDraw has several changes in algorithms that have increased the size of some structures. PowerPC alignment issues may cause the size of data structures to increase. Check your compiler documentation for further details.

To help detect collisions between the stack and the heap, a *stack sniffer* VBL task is installed that compares the current ends of the stack and heap and generates a system error 28 in case of a collision. Unfortunately, the Thread Manager is forced to disable the stack sniffer whenever it is installed. (This is because threads can have a stack in places where the stack sniffer doesn't expect them; if the stack sniffer is enabled, it would generate a system error 28.) This means you don't have the same level of protection as you did under older system software versions without the Thread Manager installed.

Too Much Recursion in QuickDraw

Native QuickDraw before version 2.4.1 used a recursive routine to handle regions. This recursive code could cause your stack to run into the heap when handling certain region shapes. Version 2.4.1 of QuickDraw changed to a non-recursive routine which eliminates this error. (You can detect the version of QuickDraw using the Gestalt selector *qd *which returns a version.) In general, recursion on PowerMacs is dangerous unless you have substantial stack space available; PowerPC stack frames are very large, and putting many of them on the stack may quickly exhaust available stack.

Interrupts Not Handled by Device Drivers

Some Type 11 errors may legitimately be illegal interrupt vector errors, rather than simply unhandled exceptions in native code. If a device driver for a NuBus or PCI card does not install an interrupt service routine, but the card raises an interrupt, you will receive a Type 11 error. This will happen whether you are running in 68K code or PowerPC code. The only solution for such a problem is to update the driver to correctly handle the interrupt issued by the card.

Other Programming Errors

Common programming errors may cause Type 11 or No FPU Installed errors. These include the same kinds of errors that usually result in address errors on 680x0-based Macintosh computers. For example:

* Indexing through an array incorrectly so that your program goes outside the memory allocated for that array (as demonstrated above).
* Disposing of memory twice
* Disposing of memory that was never allocated
* Calling DisposeHandle on a resource handle (use DisposeResource instead, to ensure that the Resource Manager doesn*t lose handles behind its back.)

Some Techniques To Help Avoid Type 11 Errors

The following techniques may help resolve situations that might lead to Type 11 errors:

* Test your code carefully.
* Install the Debugging Modern Memory Manager, available on the Tool chest Developer CD. This version of the Modern Memory Manager has additional checks installed which allow you to track down and eliminate many memory management bugs.

* Use extensions such as EvenBetterBusError (found on the Tool chest Developer CD) in conjunction with Macsbug 6.5.2 or later, to detect use of uninitialized pointers or handles.
* Use third-party testing tools such as QC* by Onyx or MemoryMine* by Adianta.

IMPORTANT: It goes without saying that good testing before you release a product will prevent expensive customer support calls later on.

User-Level Recommendations

Here are some user-level suggestions recommended by Apple for unexplained Type 11 or No FPU installed errors:

1. Upgrade your hard disk driver(s) to the latest version available. There are some known problems between SCSI Manager 4.3 and some SCSI disk drivers. Starting with System 7.5, the SCSI Manager 4.3 is installed on all Macintosh Quadras and Power Macintosh computers. There are some known programming problems in some older third-party disk drivers.

2. Upgrade to the latest System Software appropriate for your system. Several significant bug fixes in system updates should reduce the number of Type 11 and No FPU Installed errors you encounter.

3. Do a clean install of your System Software. Use the Extensions Manager control panel to determine if any additional control panels or extensions are conflicting with your system software.

4. Some Type 11 errors may result from corrupted PRAM. Unfortunately, most of extended PRAM is undocumented. (See Inside Macintosh:Operating System Utilites, chapter 7, Parameter RAM Utilities, for what details are documented.) You can restore your default PRAM values by holding down Command-Option-P-R at system startup time, or by using a shareware utility such as TechTool.

5. Make sure you are not using composite RAM in a Power Macintosh. Memory specifications are in the developer hardware notes for each computer.

6. Some users claim that installing the shareware extension SoftwareFPU cuts down on No FPU Installed problems. This extension emulates the Motorola FPU (at a considerably slower speed), thus preventing bombs from software which incorrectly makes FPU calls. This may alleviate no FPU Installed errors, but it doesn't address the fundamental problem, namely that some software is executing unexpected data or making illegal calls to a non-existent FPU.

7. Upgrade any software you find that causes repeatable errors.

Summary

There are no easy solutions for handling Type 11 Error or No FPU Installed errors. Only careful debugging and testing can reduce the number and frequency of these errors. Most problems stem from common programming errors.

AppleVision 1710AV, AppleVision 750 AV: Shortened startup sound

With an AppleVision 1710AV Display connected to a Macintosh computer, when start up the computer, sometimes only part of the startup tone is played. When the audio cable from the computer to the display is disconnected, the entire tone plays.
This article has been archived and is no longer updated by Apple.
This behavior can also occur with the AppleVision 750 AV Display.

When the Macintosh audio is connected to these displays, you cannot hear the complete startup tone. Because of the additional features in the these displays, there is a slight delay in power reaching all the components. Depending on how quickly the speakers in the display are able to power up, you may hear a partial startup tone, no startup tone, or the entire startup tone.

There is nothing wrong with your display or your computer. If you want to hear the startup chime, unplug the sound out cable that connects from your computer to the display. Once this cable is removed, you hear the chime from the built-in speaker of your computer. Until you reconnect the sound cable, all sound goes through the internal computer speaker.

Mac OS: Minimizing Memory Fragmentation

This article explains what memory fragmentation is, when it is likely to occur, and how to minimize it.
This article has been archived and is no longer updated by Apple.

Symptom

A dialog box appears with the message that there is not enough memory to continue even though you are sure your computer has plenty of memory. At other times, the Largest Unused Block information in the About This Computer window does not change even after quitting an application program.

Solution

Memory fragmentation is similar to hard disk fragmentation, but files stored on a disk can easily be broken up into fragments if there is not enough contiguous space on a disk. Programs that are loaded in memory, however, cannot be fragmented, and thus need a contiguous area of memory. Your computer may have several unused blocks of memory mixed in with the used blocks of memory, but Mac OS can make only a single unused block available to a program.

Memory becomes fragmented more frequently if virtual memory is turned off.

To defragment memory, use one of the following techniques:

Technique 1

1. Quit all open applications and desk accessories.
2. Open the applications you need to use.

Open applications appear in the Application menu. To quit an application, choose it from the Application menu, and then choose Quit from the File menu. The Largest Unused Block in About This Macintosh increases as more contiguous memory is made available, but it doesn't necessarily increase with each program you quit.

Technique 2

Restart your computer.

To avoid fragmentation again, carefully plan the order in which you open and quit programs:

1. Open first the applications and desk accessories you are least likely to quit.
2. Open last the applications and desk accessories you are most likely to quit during a work session.

By opening and closing applications and desk accessories this way, the memory you free up is contiguous with the rest of the Largest Unused Block. When you quit programs in random order, you are likely to have fragmented memory.

Other Solutions

- On a Power Macintosh computer, you may experience less memory fragmentation if virtual memory is turned on. For more information see article 16889: **Power Macintosh: Turn on Virtual Memory for Best RAM Usage**
- Deselect "Load only when needed" in the TCP/IP control panel. For more information see article 19484: **Open Transport 1.1: Memory Fragmentation**
- You should update to system software version 7.5.5 or later, which is available from http://www.apple.com/swupdates/ . For additional update information see article 20081: **System 7.5.3: What Updates Do I Need for System 7.5.5?**

AppleVision 1710AV: Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding the AppleVision 1710AV Display and the AppleVision 1710 Display, with answers to those questions.

Note: The only differences between the AppleVision 1710AV and AppleVision 1710 Display are the speakers and built-in microphone included on the AppleVision 1710AV Display.

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. I have a conflict between the AppleVision 1710AV Display Enabler and the Now Toolbox system extension. My Now Startup Manager disables the Display Enabler every time. How can I correct this?
2. When starting up, the Conflict Catcher and QuickTime system extensions load, then the Display enabler loads, but erases the Conflict Catcher and Quicktime icons and the Mac OS logo before the rest of the icons load.
3. During startup, why does my Macintosh Performa 630CD and AppleVision 1710AV Display pause at the Display Enabler system extension and then continues with just the single progress bar, without the "Welcome to Macintosh" display?
4. Using Display enabler and the AppleVision Setup control panel, my system is unusable. When I remove Display enabler and AppleVision Setup control panel everything works fine. Is there something wrong with the software for the AppleVision 1710AV Display?
5. I am using a Power Macintosh 7500 computer with an AppleVision 1710AV Display. After I re-calibrate the monitor, why does the display have a lavender (purple) color or spirals of faint diagonal lines across the entire screen?
6. Why are there a number of barely visible colored lines running diagonally across the screen when the display is blank (during startup or when the screen saver is on)?
7. We have experienced some incompatibilities with the AppleVision 1710AV Display, some third party boards, and the internal video on the Macintosh II VX. Are there any known issues with a setup like this?

Question 1: I have a conflict between the AppleVision 1710AV Display Enabler and the Now Toolbox system extension. My Now Startup Manager disables the Display Enabler every time. How can I correct this?

Answer: First, there is a known issue with Now's Startup Manager and AppleVision Software (specifically the Display Enabler). The solution is to disable Now Startup Manager and use Extension Manager. Now is aware that they have an issue and are working on a fix for it. This fix did not make into Now Utilities 5.0.2.

Second, AppleVision Software requires Display Enabler 2.0. The Display Enabler extension is needed for any 040 or nubus based Macintosh.

Question 2: When starting up, the Conflict Catcher and QuickTime system extensions load, then the Display enabler loads, but erases the Conflict Catcher and Quicktime icons and the Mac OS logo before the rest of the icons load.

Answer: AppleVision Software requires Display Enable 2.0. The Display Enabler extension is needed for any 040 or nubus based Macintosh.

Question 3: During startup, why does my Macintosh Performa 630CD and AppleVision 1710AV Display pause at the Display Enabler system extension and then continues with just the single progress bar, without the "Welcome to Macintosh" display?

Answer: As it states in the Read Me: "With some system software and hardware configurations, your screen may not redraw correctly during the startup process. This will not affect display performance." This is referring to issues like the one above. When the Display Enabler is loading, the screen may redraw, leaving the user with only a thermal bar left with no welcome to Macintosh window.

Question 4: Using Display enabler and the AppleVision Setup control panel, my system is unusable. When I remove Display enabler and AppleVision Setup control panel everything works fine. Is there something wrong with the software for the AppleVision 1710AV Display?

Answer: AppleVision Monitors require both of these software components to be loaded and they also require that the ADB cable is connected to the monitor. Otherwise the user will only get 640x480.

Question 5: I am using a Power Macintosh 7500 computer with an AppleVision 1710AV Display. After I re-calibrate the monitor, why does the display have a lavender (purple) color or spirals of faint diagonal lines across the entire screen?

Answer: This is usually caused by an error in recalibration. You only need to recalibrate a couple of times to recover from this situation. However, if the issue continues to occur there may be a hardware issue. Since the color data is transmitted over ADB, you should also avoid pressing the keyboard or bezel buttons during the recalibration.

Question 6: Why are there a number of barely visible colored lines running diagonally across the screen when the display is blank (during startup or when the screen saver is on)?

Answer: The diagonal lines are caused by the redraw gun inside the monitor resetting. You will see this under two circumstances.

First, brightness and contrast are turned all the way up to full. You should turn brightness down to about 50% and leave contrast all the way to full and see if the lines go away. Brightness at 50% and contrast at 100% is the suggested viewing level to get the brightest, clearest picture.

Second, the diagonal lines may appear if there is an error in recalibration. If lowering the brightness does not help, recalibrate the monitor a few times. When an error in recalibration does occur the monitor is supposed to be reset to its previous setting. Unfortunately there is no sure way of catching all of the recalibration errors. You may have to recalibrate up to 4 times before the monitor's color settings are properly restored from an incorrect calibration.

Question 7: We have experienced some incompatibilities with the AppleVision 1710AV Display, some third party boards, and the internal video on the Macintosh II VX. Are there any known issues with a setup like this?

Answer: AppleVision Monitors were only qualified on the supported built-in monitor ports (for all 68040 and PPC Macs) and on the 24AC NuBus card and the ATI PCI card. The third-party would have to revise its driver to work with our monitor and software.

Color LaserWriter: Excessive Background Toner

My Color LaserWriter 12/660PS sometimes leaves a light dusting of colored toner on the white areas of my printed output. Is this normal? Can I do anything to reduce the amount of background toner that is deposited?
This article has been archived and is no longer updated by Apple.
Background toner is especially noticeable near the leading edge of the paper where an abrupt transition is visible approximately 7/16" (8mm) from the top edge of the paper. This region is where the paper is gripped by the transfer drum, and cannot be printed on. When viewed under a microscope or magnifying lens the background toner consists of randomly deposited toner particles from one or more of the cyan, magenta, yellow, or black toner cartridges.

The majority of customers reporting background toner issues are either using toner cartridges that are almost at the end of their useful life, or are located in areas where the relative humidity drops significantly as the cool winter months approach. In many cases the relative humidity is below the range recommended in Appendix A of the Color LaserWriter 12/600 PS user's manual. The manual recommends that the relative humidity be between 35 and 70% for optimum print quality, although the allowable range is 20 to 80% non-condensing when the temperature is between 59 to 86 F (15 to 30C). The relative humidity can drop to as low as 10% if the room temperature is maintained at or above 68 F (20 C). The low temperature value of 50 F(10 C) listed in some versions of the user's manual is in error.

Recommendations
In order to reduce the amount of background toner try the following recommendations:

Operate the Color LaserWriter 12/600 PS in an environment with a relative humidity that falls between 35 and 70% with the temperature between 68 and 82 F (20 to 27.5 C) for best print quality. Low cost digital hygrometers/thermometers that measure temperature and humidity can be purchased at many consumer electronics stores. A humidifier that is appropriate for the room size where the printer will be used may be necessary to increase humidity. Buildings located in dry climates may have humidifiers integrated into their heating and ventilation systems.

If the background toner is predominantly one color (cyan, magenta, yellow, black) when printing color documents then try replacing the corresponding toner cartridge. Background toner can appear when printing black & white documents, however the background toner will contain only black toner particles because the printer switches to a single pass black-only printing mode. Replacing the corresponding toner cartridge(s) has been successful in some cases, however further investigation is necessary to understand the relationship between adding a new toner cartridge and background toner.

Store the paper and consumables in the same area as the Color LaserWriter 12/600 PS so that they are exposed to the same temperature and humidity conditions. Leave each ream of paper in its protective paper wrap until it is ready to be loaded into the cassette tray.

LaserWriter 8.2.3f: Read Me

This article contains the Read Me file included with the LaserWriter 8.2.3f software posted online. The driver has been posted separately for the benefit of Mac OS 8 customers, as the software installer does not work with Mac OS 8. If you are using Mac OS 7.6.1 or earlier, please download the four LaserWriter 8.2.3f disk images.
This article has been archived and is no longer updated by Apple.

About the LaserWriter 8 Fax Printer Driver Version 8.2.3f

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference.

The software on this disk includes version 8.2.3f of the Apple LaserWriter 8 fax printer driver, which works with the LaserWriter Select 360f, LaserWriter Pro 810f, and the LaserWriter 16/600 PS Fax. This document includes information about the software, as well as about several of the printers.

About the LaserWriter 8f Printer Driver

When you set up your printer, you install the LaserWriter 8 printer driver and the fonts and printer software that you need. When you install the fax card option, you also must install the LaserWriter 8 fax printer driver to enable the printer's faxing capabilities. Both drivers are installed in the Extensions folder in your System Folder. They provide identical printing capabilities. To use the fax capabilities of your printer, you should open the Chooser and select the fax driver whenever you want to use the printer for faxing.

Installing the Printer Driver Software

The manual that comes with your printer contains detailed installation instructions. You cannot install the software by dragging icons; you must use the Installer program as described in the printer manual.

IMPORTANT Before installing the printer software, you should restart your system with all Extensions turned off. To do this, hold down the Shift key while you restart your computer.

The Installer places the following files in the System Folder on your hard disk:

LaserWriter 8f is placed in the Extensions folder.

- The PostScript Printer Description (PPD) files that are used by LaserWriter 8 are in the Printer Descriptions folder located in the Extensions folder.
- The Apple Printer Utility and Read Me information are placed in the Apple LaserWriter Software folder.
- The LaserWriter Fax Utility and LaserWriter Fax Log are installed in a folder called LaserWriter Fax Software (placed within the System Folder).
- The Chooser 7.3 desk accessory is placed in your Apple Menu Items folder if you have an older version.
- The PrintMonitor 7.1.2 is placed in your Extensions folder if you have an older version.

About PPD Files

The LaserWriter 8f driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle. Installing the fax card software for the printer installs an additional PPD that supports the faxing capabilities of the printer.

To take full advantage of your printer's features, click the Setup button in the Chooser when selecting your printer for the first time or after installing an additional option. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer. The driver will automatically select the PPD that supports the faxing capabilities of your printer.

About Creating EPS Files

You can create an Encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, an extremely large file may be created.

If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.

When you create EPS files with preview information included, other applications that create their own PostScript code may not display the EPS

file accurately on the screen.

About the LaserWriter Fax Utility and the Apple Printer Utility
Installing the LaserWriter Fax printer driver software installs the LaserWriter Fax Utility, which you should use to configure the faxing capabilities of the printer.

When you installed the LaserWriter 8 driver and printer software, the Installer placed the Apple Printer Utility program in a folder named "Apple LaserWriter Software." The Apple Printer Utility program is designed to configure your LaserWriter printer.

Using a Hard Disk to Store Fax Data
If a hard disk is attached to your printer, you can use it to hold incoming fax data before it is printed, and to hold outgoing fax data before it is transmitted. (By default, fax jobs are stored in printer RAM.)

Because more space is typically available on a hard disk than in RAM, storing fax data on a hard disk allows you to receive and transmit longer faxes without having to divide them up into smaller transmissions.

To configure your printer to use an attached hard disk to store fax jobs, open the Apple Printer Utility and choose Send PostScript File from the File menu. Select the file "UseDiskForFax" in the LaserWriter Fax Software folder in the System Folder, click Add, then click Send.

To configure your printer to use RAM to store fax jobs, open the Apple Printer Utility and choose Send PostScript File from the File menu. Select the file "UseRAMForFax" in the LaserWriter Fax Software folder in the System Folder, click Add, then click Send.

After downloading either file to the printer, you must restart the printer for the change to take effect.

IMPORTANT If you use a hard disk to hold fax data and you later want to disconnect the hard disk from the printer, be sure to configure the printer to use RAM to store fax jobs before you remove the hard disk. Otherwise, your printer will take a little longer to start up the first time when it detects that the hard disk has been removed.

Using the LaserWriter 8 Fax Printer Driver With LaserWriter Printers

When using the LaserWriter 8.2.3f driver, you should be aware of the following situations. Some happen with all LaserWriter printers, and others happen only with specific models.

All LaserWriter Printers
The LaserWriter 8.2.3f driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text flow in some documents has changed or is clipped to fit the new imageable area. To maintain your document format when printing to different printer models, deselect the Larger Print Area option in the Page Setup Options dialog box.

Some older printers with small amounts of memory will not print documents containing large numbers of fonts unless the Unlimited Downloadable Fonts option is selected in the Page Setup Options dialog box. If a document using multiple fonts doesn't print using the LaserWriter 8 driver, try selecting Unlimited Downloadable Fonts in the Page Setup Options dialog box and print again.

Printing multiple documents with the Finder may not work if the documents have been created by different application programs.

If you encounter a time-out (PostScript error -8993) when printing multiple copies of large and complex documents in the background, print the documents one at a time or select foreground printing to avoid this problem.

Note the following when you create rotated text, saved as a PICT file, and import it into a document as a graphic: Though you may position rotated text in the frame so that parts of it should not be visible and should not print (is clipped), the text will still appear on the printed document.

LaserWriter 16/600 PS
If Tray Switching is turned on and you have installed the optional 500-sheet feeder, and it contains the same paper size as the 250-sheet feeder, you should set up the driver to use the 500-sheet feeder as the preferred paper source for optimal printing performance. See the manual that came with your printer for instructions on selecting the 500-sheet feeder as the preferred paper source.

LaserWriter Pro 810
With some graphics programs, bitmapped graphics will be reduced by 25% in size when printed with the Precision Bitmap Alignment option in the Page Setup Options dialog box.

When you create a PostScript file with a LaserWriter Pro 810 selected as the printer and send the file to a printer that uses PostScript Level 1, a PostScript error will occur.

LaserWriter Pro 600 and 630
You cannot use Auto Select as the Paper Source in the Print dialog box to print envelopes from the optional envelope feeder.

When you print at a resolution of 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

LaserWriter II NT and II NTX
If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.

Do not use the B5 tray to print envelopes on a LaserWriter II NT. Use the letter tray instead.

LaserWriter IIg and IIf
When you select paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.

The US Legal paper size has been changed on some LaserWriter IIf/IIg printers to be more compatible with other Apple LaserWriter printers. If your legal-sized documents no longer fit on the page, select Larger Print Area in the Page Setup Options dialog box.

Some form-printing programs cannot print forms using the Layout settings in the Page Setup dialog box.

Using the LaserWriter 8 Driver With the Kanji System
To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.1.1 or later.

Using the LaserWriter 8 Driver With Application Programs

Some application programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

With many programs, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.

Aldus Freehand 4.0
Documents do not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
EPS files created using the LaserWriter 8 driver from within Freehand cannot be used in other programs.

Aldus PageMaker 5.0
Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus SuperPaint 3.5
Rotated or filled polygons print as solid gray objects.
Gradient fills may not print when copied into other programs.

Canvas 3.5
When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if fonts Geneva, New York or Monaco are used.

CricketDraw III 2.01
When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, underlined TrueType fonts may not print.

CricketPresents 2.1
You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

FileMaker Pro 2.1
When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Freehand 5.0
When you are printing with Freehand 5.0, make sure to set the Output Device Setup in the Print Options dialog box to "Use defaults."If you have a PPD selected, the QuickDraw GX driver will only print a blank page.

Informed Manager 1.4
When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

Lotus 1-2-3 1.1
Text printed with the Outline or Shadow text style appears filled with gray.

MacDraft 3.01 and earlier versions
When you print using the Cut Marks option, a PostScript error results.

Microsoft PowerPoint 3.0
Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0
Printing documents that have rotated objects with rounded corners results in a PostScript error.

Painter 2.0
When you print using the Invert option, images do not print inverted correctly.

PixelPaint Pro 3.0
When you print using the Invert option, images do not print inverted correctly.

QuarkXPress 3.3
Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

RagTime 3.2
You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0
Use ReadySetGo! version 6.0 with the LaserWriter 8 printer driver; earlier versions will not work.
You cannot print documents that use pen patterns.

SoftWindows
When you print with Autosend on, don't select the option to print before the print job has finished spooling to the Macintosh, or PostScript syntax errors will occur.

Studio/8 & Studio/32
When creating an EPS file with these programs and the LaserWriter 8 driver, you must select the QuickDraw Printer option.

WordPerfect 3.0
When you select the Unlimited Downloadable Fonts option and print rotated text in Watermark, the entire document rotates when printed.

How to Get Updated Printer Software
These articles can help you locate the software update mentioned here:
"**Where To Find Apple Software Updates**" - Lists online services for free Apple software updates.

Printing With QuickDraw GX

Using Manual Feed
If you select manual feed, and the printer still prints from the cassette, try to print by selecting Automatic Paper Feed from the GX Print dialog box first. Then, print again by selecting Manual Feed.

Freehand 5.0
When you print with Freehand 5.0, make sure to set the Output Device Setup in the Print Options dialog box to "Use defaults." If you have a PPD, selected the QuickDraw GX driver will only print a blank page.

Adobe and PostScript are trademarks of Adobe Systems Incorporated or its subsidiaries and may be registered in certain jurisdictions.

PowerBook: Password Security Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding the PowerBook password protection software, with answers to those questions. This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. What do I do if I forget my PowerBook computer's password? Is there a way to bypass it?
2. I activated password protection on my PowerBook computer. Now when I try to access it, it does not recognize my password. I know I am entering the correct password. I also see an arrow in the password field. What does the arrow mean?
3. I opened the password Security Control Panel, clicked the ON button, and I get a message that says "You must turn off password protection before using this PowerBook in SCSI disk mode." What should I do?
4. I am at the password entry screen for my PowerBook computer, and the OK button is dimmed. Also, there is no cursor in the window so I can't enter my password.

Question 1: What do I do if I forget my PowerBook computer's password? Is there a way to bypass it?

Answer: If you forget your password, you cannot bypass the hard drive by booting the PowerBook with extensions off. The password is written to the hard drive on the driver partition. You should take your PowerBook, with your proof of purchase (receipt), to an Apple Authorized Service Provider where a technician has the means to bypass the password security.

Question 2: I activated password protection on my PowerBook computer. Now when I try to access it, it does not recognize my password. I know I am entering the correct password. I also see an arrow in the password field. What does the arrow mean?

Answer: The arrow indicates the caps lock key is down. Since password protection is case sensitive, simply releasing the caps lock key causes the arrow to disappear and solve the problem.

Question 3: I opened the password Security Control Panel, clicked the ON button, and I get a message that says "You must turn off password protection before using this PowerBook in SCSI disk mode." What should I do?

Answer: Simply click on the OK button or press the Return key. This is just a general warning message. Once you press OK the password entry screen will come up.

Question 4: I am at the password entry screen for my PowerBook computer, and the OK button is dimmed. Also, there is no cursor in the window so I can't enter my password.

Answer: You will not get a blinking cursor in the password entry area. Simply enter the password and you will see security dots (bullets) appear in the window. This is to prevent someone from reading your password when you enter it. Once these dots appear in the window, the OK button will darken, and you can complete activating your password.

MacDNS 1.0: Importing Existing BIND Zones

Import existing BIND files containing DNS information for a zone, instead of having to input the host and IP address data manually.
This article has been archived and is no longer updated by Apple.
MacDNS supports importing existing BIND files, although there are a few issues associated in doing this. Here are the steps to follow:

1. After downloading the appropriate resource database files for a particular zone with ftp from a UNIX DNS server, be sure that the file is saved in generic text format.

2. Edit the downloaded text file, be sure the Start of Authority (SOA) resource record is at the beginning of the file.

IMPORTANT: Do not have comments (";") or $ORIGIN listed at the top of the file.

Below is an example of a proper SOA resource record:

company.com. IN SOA host.company.com. root.host.company.com. (

```
19950927  ; serial number
    21600     ; secondaries refresh (6 hours)
    3600      ; secondaries retry (1 hour)
    3600000   ; secondaries expire (41 days)
    108000 )  ; minimum default TTL (30 hours)
```

Once edited, save the file again as text.

3. With MacDNS active, choose Message Log from the Window Menu and set the Log Threshold to Microscopic. This will assist in debugging if a problem occurs importing the file.

4. Choose Open Zone File from the File menu, to open the SOA resource record file. MacDNS will import the resources. If at any point MacDNS does not import successfully, check the Message log for help in determining the failure point.

5. Once imported, choose Set Zone Information from the Hosts menu and verify that the information is correct.

At this point, MacDNS is the primary name server for that zone. The PTR Records are internally created by MacDNS.

LaserWriter 8 Driver: Printing an EPS File

I print an EPS file with the LaserWriter 8 printer driver options, I then click the Save button, and a dialog box appears with EPS and font options as shown below:

Option Format: PostScript print EPS Mac standard preview EPS Mac enhanced preview EPS no preview Font Options: No fonts All fonts

I want to print to an EPS file with all fonts included and then import the EPS file into Quark Express. In order to ensure the import is correct a preview of the EPS file in Quark Express should be available after importing. With the options listed above it seems this would be possible, however, I cannot get Quark Express to work this way.

How does preview in EPS files work? What are the differences between standard and preview format? What format should I use to enable standard Macintosh applications preview the content of a EPS file?
This article has been archived and is no longer updated by Apple.
We have enclosed a description of all of the options when you select a destination of Save to disk. The EPS Standard Preview contains an equivalent 72 dots per inch (dpi) bit image copy of the original applications image. The Enhanced Preview is a copy of the file as originally generated by the application. Quark XPress can import and print EPS, but it has an issue displaying these images -- an issue Quark intends to resolve. They could not provide a time frame for when the fix will be available, so you may wish to check back with them periodically.

Being able to import and/or display EPS files are options you will find in some but not all applications. It is up to the discretion of the developer to support or not support this feature.

In a EPS file, the PostScript is stored in the data fork, and the screen image is stored as a PICT resource #256. For a third-party application to display the EPS file, the application must look for the PICT resource to read and display the image. Again, not all applications support this feature.

Save option descriptions

The LaserWriter 8 dialog offers many options including the ability to select a Destination that specifies where to send the driver's output:

Printer: send to hardcopy printer.
File: send to a disk file.

If you are using LaserWriter 8f or Fax PPD, another Destination becomes available:

Fax: send to a fax-capable output device for fax transmission.

After selecting the Save you are given a choice of formats in which to save the file:

PostScript Job

A copy of the driver's PostScript output, exactly as it would have been sent to the output device. The file is formatted for the currently targeted output device with whatever features and options are currently in effect, and conforms fully to Adobe Document Structuring Convention (DSC).

EPS Mac Standard Preview

A single page image (typically an illustration) in Encapsulated PostScript form in the file's data fork, along with an equivalent 72-dpi bit image in the resource fork for displaying the page on the Macintosh screen. The bit image is obtained by playing back and rasterizing the 'PICT' resource representing the page in the document's spool file, as originally generated by the client program.

EPS Mac Enhanced Preview

A single page image (typically an illustration) in Encapsulated PostScript form in the file's data fork, along with an equivalent 'PICT' resource in the resource fork for displaying the page on the Macintosh screen. This is a copy of the same 'PICT' representing the page in the document's spool file, as originally generated by the client program.

EPS No Preview

A single page image (typically an illustration) in Encapsulated PostScript form in the file's data fork, but without an associated preview image in the resource fork. This form is intended for transfer to other, non-Macintosh platforms.

Font Inclusion controls the inclusion of downloadable fonts in the PostScript output file:

None

Includes no fonts; assume all needed fonts are already available on the target device. In place of the fonts themselves, the PostSript output will include a DSC %%IncludeFont comment for each font used in the document.

All

Include all fonts used in the document that are available on the host Macintosh.

All But Standard 13

Include all fonts used in the document that are available on the host Macintosh, except the core set of thirteen standard typefaces that are built into virtually all PostScript printers (Times-Roman, Times-Bold, Helvetica-Bold, Helvetica-Oblique, Helvetica-BoldOblique, Courier, Courier-Bold, Courrier-Oblique, Courier-BoldOblique, and Symbol).

ASCII/Binary

Specifies whether to save the output file in 7-bit ASCII or 8-bit binary format:

ASCII Save file in 7-bit ASCII format.

The resulting file contains no characters outside the range 32127 ($20$7F). In particular, it contains no control characters, and thus is suitable for transmission across ASCII-transparent communication channels such as asynchronous serial.

Binary Save file in 8-bit binary format.

The resulting file is typically smaller than the corresponding file in ASCII format (particularly if it contains sampled image data), but is suitable for transmission only across 8-bit-transparent communication channels.

Level 1 Compatible/Level 2 Only

Specifies the level of PostScript compatibility for the output file:

Level 1 Compatible: Compatible with all PostScript devices.

The file includes code to test the level of the device's PostScript interpreter and emulate the effects of Level 2 features on devices that do not support them directly. Level 2 features that cannot be emulated efficiently in Level 1 are suppressed.

Level 2 Only: Compatible with PostScript Level 2 devices only.

Assumes the availability of all Level 2 features and generates no level-checking or emulation code. The file may include Level 2 features (such as data compression for sampled images) that cannot be emulated efficiently in Level 1. Output files in Level 1 Compatible format tend to be larger than Level 2 Only files, both because of the additional emulation code they contain and because they cannot take advantage of Level 2 data-compression techniques. Files in Level 2 Only format are smaller, but will typically cause PostScript errors when printed on a Level 1 device.

The default setting is Level 1 Compatible.

Open Transport: Memory Fragmentation Discussion

This article discusses memory fragmentation issues related to the use of TCP/IP with Open Transport 1.1, and the effect of the 'Load Only When Needed' option in the TCP/IP control panel.
This article has been archived and is no longer updated by Apple.
Memory may not be released efficiently when the 'Load only when needed' option is selected in the TCP/IP control panel. This is a normal condition for the Mac OS, especially if non-TCP applications are opened after a TCP/IP application is opened.

When opening TCP/IP applications, if TCP is not loaded Open Transport loads the TCP/IP stack into the memory reserved by Mac OS for applications (application heap) after the TCP/IP application. After the last TCP/IP application is quit, the TCP/IP stack unloads from memory. However, if other non-TCP/IP applications have been loaded before quitting the TCP/IP application, memory can become fragmented.

For instance, if you load TCP/IP application A and another non-TCP/IP application B, memory may be arranged as follows (from top of memory to bottom):

Free Memory
APP B
TCP/IP STACK
APP A

When you quit Application A memory may look like this:

Free Memory Block 2
APP B
Free Memory Block 1

At this point, the memory is fragmented because the free memory block is split into two parts by application B. If you choose About this Computer from the Apple menu and look at the memory usage information, the Largest Unused Block would be smaller than it was before opening applications A and B. The Largest Unused Block is the largest block of contiguous memory, and with application A in the middle of two free memory blocks, blocks 1 and 2 cannot be joined together to form a larger contiguous block.

The workaround is to deselect the 'Load Only As Needed' option in the TCP/IP control panel (but leave TCP/IP active). This forces Mac OS to load TCP/IP into memory before applications use any of the application heap, thereby preventing memory fragmentation. The drawback is that memory is always be allocated to the TCP/IP stack, defeating the benefits of the 'Load Only As Needed' option.

The TCP/IP stack unloads from memory about two minutes after there is no TCP/IP activity. With some PPP connections, the stack does not unload. PPP users should always have TCP/IP loaded.

Mac OS: Technical overview of disk volume structures

This article provides a technical overview of the elements of a disk volume or partition, including the partition map, boot blocks, master directory block, volume bitmap, B-trees, and more.
This article has been archived and is no longer updated by Apple.
A disk can contain several partitions, which are treated as separate virtual disks by the system. Each partition contains information similar to that shown here:

Layout of a Disk Partition

Note: Floppy disks are not partitioned and do not have all the elements described in this article. The first block on a floppy disk contains the boot block for its single volume.

Driver Descriptor Map
A disk's first block (block 0) contains the driver descriptor map-information on the number and location of the drivers on the disk.

Partition Map
The second block begins the disk's partition map. It specifies the start and length of each partition as well as its type (Macintosh, A/UX, MS-DOS, and so forth). The partition map itself is actually a partition and contains an entry for itself.

Device Driver
The device driver is located after the partition map. It is used for communication with the drive. (Note that if the device driver is updated after the drive is initialized, the driver may be moved to the end, depending on space constraints.)

Boot Blocks
Mac OS Standard format (HFS) volumes begin with two boot blocks. This is where startup instructions are stored along with directions for locating the System and Finder files.

Master Directory Block
The master directory block contains volume information such as the date and time of a volume's creation, the number of files the volume contains, and the allocation block size.

The allocation block size is the minimum number of bytes that can be allocated for a file. With Mac OS Extended format, it is 4K for most volumes regardless of their size. With Mac OS Standard format, the allocation block size is dependent upon the size of the volume. A Mac OS Standard volume can have no more than 64K allocation blocks. Therefore, the larger the volume, the larger the allocation block size. Whenever a file is written to the disk, it is allocated a certain number of logical blocks or "clumps. This slows down the process of fragmentation, but can result in open space being left at the end of each file's allocation.

When the master directory block is read, the volume is mounted and an area is created in memory called the Volume Control Block (VCB).

Volume Bitmap
The volume bitmap is a record of which blocks are allocated to files. It contains one bit for each allocation block on the volume. If the block is taken, the bit is set. If the block is available, the bit is cleared.

Catalog File/Tree
Contains hierarchical information about the relationship and structure of files and folders and their location on a volume.

Specifically, it contains the parent directory for each file. In order to determine the full path, a directory's parent is found, and so on, until the root level is reached. The catalog file and extents file are each in the form of a "B-tree" (and are the source for all B-tree type errors). See below for a discussion of B-trees.

Extents File/Tree
An "extent" is a contiguous range of blocks that are allocated to a file. The extents file (also called Extents Overflow File) keeps track of the location of records that cannot be placed contiguously. This information is used to locate pieces of a file when it is loaded. Some extent information is contained within the MDB and VCB. The first three file extents are always retained in memory with the VCB.

Given this information, it is understandable why optimizing, or "defragmenting," a disk is so effective. Making files contiguous reduces seek time and reduces the number of accesses to the extents file.

All of the items listed before the catalog and extents files are contiguous. The catalog and extents files can be anywhere on the volume and are not contiguous.

The catalog file also stores Finder information for each file. This information consists of:

file type: Identifier of one of several categories.
file creator: Name of the application that created it.
file's location in window: Relative position in the window when it's opened.
directory that contains file: The directory path of the file.
Finder flags: These are information items (bits) that can be set to on or off.

The Finder takes these into account when it reads them. Here is a list of the Finder flags:

Finder Flags

Flag	Description
isInvisible	File won't appear in dialog box listings or windows.
hasBundle	File is associated with a custom icon.
nameLocked	File can't be renamed or have another icon assigned to it by a user.
isStationery	File is a stationery pad.
isShared	File has its own customized icon.
hasCustomIcon	File has its own customized icon.

The rest of the volume contains application/data files, the catalog file, extents overflow file, and open space.

A Discussion of B-Trees
Catalog and extents files are organized into B-trees, a structure that allows for optimum read speeds.

Both of these files contain only data forks; there are no resource forks. The location of the start of the catalog and extents B-tree is contained at the beginning of the MDB and is stored in memory.

This illustration offers a rough diagram of what the disk structure of the catalog and extents files look like:

Disk structure of the catalog and extents files

A directory, which consists of the catalog B-tree and the extents B-tree, keeps track of file locations (as well as other information). The catalog B-tree contains a unique entry for every file, specifying its name, attributes, location, and other information. It functions as an index or a table of contents for the disk. The extents B-tree contains information about file fragments.

The bottom level of a B-tree structure is occupied exclusively by leaf nodes. A catalog file leaf node can contain four different types of records, one of which is the file thread record. A file thread record provides a link between a file and its parent directory. It enables the File Manager to find the name and directory ID of the parent of a given file.

B-tree structures are complex. If one becomes damaged, erroneous information is read by the File Manager and the referenced files can also become damaged. This is why it is vital to run Disk First Aid or similar utilities on a regular basis.

Newton Print Pack: HP LaserJet print solutions

I have an Apple MessagePad and an HP LaserJet printer. How can I print from the Apple MessagePad to the HP LaserJet?
This article has been archived and is no longer updated by Apple.
You have two possible options:

1- Use the "Choose Network Printer" option in Newton OS 1.0 and 2.0.
2- Use the Newton Print Pack

Use the "Choose Network Printer" option in Newton OS 1.0 and 2.0

All Apple MessagePads have a built-in PostScript/AppleTalk driver, very similar to the Mac OS printer driver "LaserWriter8". This means any AppleTalk-based networked laser printer is compatible with the Apple MessagePad. Some HP LaserJet printers have PostScript and AppleTalk built-in, and almost all models can be upgraded to support these features. HP Technical Support recommended checking the startup page for individual printers.

The Apple MessagePad functions as a LocalTalk device and supports several physical connections, so a serial cable can be used for a direct connection. LocalTalk connectors allow the Apple MessagePad to print to any supported printer on the AppleTalk network.

Use the Newton Print Pack

LaserJet printers with a parallel port can print from an Apple MessagePad using the Newton Print Pack. The Newton Print Pack is sold separately, and only has some specific LaserJet models lists. However, any Hewlett-Packard PCL-based printer should work with the Newton Print Pack.

The Newton Print Pack provides both a physical connection (serial to parallel conversion) and a PCL driver for the NewtonOS.

Troubleshooting note:

If you are trying to print to an HP LaserJet that you believe has PostScript/AppleTalk support, and you cannot see it in the "select a Printer" window, try printing directly to the printer with a serial cable. Sometimes an AppleTalk networking problem prevents the Apple MessagePad from seeing the printer properly.

Macintosh 5200/5300/6200/6300: Repair Extension Program (1/97)

The pointer on the screen of my Power Macintosh 5200/75 computer seems to freeze when I am working in different applications. The color hue also seems to change over time. What can I do?

This article has been archived and is no longer updated by Apple.

**** Note: This Repair Extension Program expired June 28, 2002. ****

Apple has identified the causes for the issues you describe and has created a Repair Extension Program to address them. This is NOT a product recall. Rather, it is a program designed to resolve the sporadic freezing and color hue changes on your computer.

Quality is a top priority at Apple, and this repair program addresses certain quality issues that have surfaced with these products. Apple is putting these repair programs in place as part of the company's goal to provide a high level of customer satisfaction.

ISSUES ADDRESSED
==========
The Repair Extension Program for Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers addresses two key quality issues:

1) System freezes caused by specific, known component issues that have been identified by Apple.

2) Sudden or intermittent changes in the monitor's color hue on Power Macintosh and Performa 5200 and 5300 series computers due to a particular cable.

MODELS INCLUDED
==========
* Power Macintosh 5200/75 LC, 5300/100 LC
* Macintosh Performa 5200, 5215, 5300
* Macintosh Performa 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290, 6300

*Note:
The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.

REPAIRS INCLUDED IN PROGRAM
==========
The Repair Extension Program will include some or all of the following, as appropriate, for a particular computer:

* Check the logic board and replace as appropriate.
* Check revision of the unit and replace a cable to correct the sudden or intermittent changes in color hue.

IMPORTANT NOTES
==========
* System freezes or video issues can occur for reasons unrelated to the component problems described above. Any such issues would not be covered by this Repair Extension Program.

* If your computer is affected by either of the two specific issues identified above, call 1-800-SOS-APPL (in the United States) or contact an Apple-authorized service provider (outside the United States) to schedule your system for repair.

* This program will remain in effect for 7 years.

Acrobat or Adobe Type Manager: Substitution Fonts Missing

This article discusses missing substitution fonts in Acrobat or Super Adobe Type Manager.

This article has been archived and is no longer updated by Apple.

Symptom

An alert box appears with the following error message:

> "The Substitution fonts necessary for Acrobat or Super Adobe Type Manager are missing. Please reinstall either software package."

Solution

Reinstall Adobe Acrobat Reader, which installs the proper substitution fonts and should correct this error.

Acrobat Acrobat Reader can be found on the Mac OS install CD that came with your computer. It is also available from Adobe's Web site at http://www.adobe.com.

WorldScript: Component Names & Version History Questions

This article discusses the differences between "WorldScript Updater", "WorldScript Pieces Install", and "7.5.1 WorldScript Updater".

Also, why the WorldScript Power Adapter extension is installed by the System 7.5.3 installer, when the rest of the required software (when using WorldScript) is not?

This article has been archived and is no longer updated by Apple.

Different Names For The Same Thing

"WorldScript Updater", "WorldScript Pieces Install", and "7.5.1 WorldScript Updater" are all the same thing. The next WorldScript Update is expected to have only one name.

Worldscript Updater Versions

There are two versions of the "Worldscript Updater" currently available, version 1.0 and version 1.0.1. Version 1.0 is currently posted online. New machines, such as the Power Macintosh 5400/120, include version 1.0.1, which should be used in place of version 1.0.

The changes in 1.0.1 are as follows:

Version 1.0	Version 1.0.1
InputBackSupport (7.5.1)	InputBackSupport (7.5.3)*
WorldScript I (7.5.1)	WorldScript I (7.5.2)**
WorldScript II (7.5.1)	WorldScript II (7.5.1)***

* Version 7.5.3 of InputBackSupport includes changes for the Korean Language Kit (KLK) support.

** Version 7.5.2 of WorldScript I fixes a bug that occurred when used with Adobe Type Manager and fixes a problem in the Hebrew and Arabic Setting control panels.

*** Version 7.5.1 of WorldScript II was not revised for version 1.0.1.

Why The WorldScript Power Adapter Is Always Installed

The WorldScript Power Adapter extension includes patches that improve overall printing performance. These improvements are independent of Language Kit software. This is why it is installed by the System 7.5.3 installer while the rest of the required Language Kit/Worldscript software is not. The name of this extension may be misleading, except that it also includes some WorldScript enhancements.

LaserWriter 12/640 PS: Text on envelopes smears

I am printing envelopes using a LaserWriter 12/640 PS printer and some of the text on the envelopes is getting smeared. How can I prevent this?
This article has been archived and is no longer updated by Apple.
There will be some level of smearing when you print envelopes. Smearing occurs where the envelope is thickest, most commonly appears near the edge of the envelope. In order to minimize the amount of smearing, you should avoid printing close to the edge of the envelopes.

LaserWriter 12/640 PS: Duplex Unit Constantly Jams

I have a LaserWriter 12/640 PS printer with the optional duplex unit attached. I am having a problem with paper constantly getting jammed in the duplex unit. How can I correct this?
This article has been archived and is no longer updated by Apple.
Make sure that the duplexer paper guide and connector clips are installed correctly. The instructions for installing the duplex printing unit are on pages 133-141 of the LaserWriter 12/640 PS User's Guide. These instructions are also listed below for your convenience.

Installing the Duplex Printing Unit
==========

With the optional duplex printing unit, you can print on both sides of the paper (often called duplex printing or two-sided printing). You can only duplex print from the paper cassettes. You cannot duplex print from the multipurpose tray.

Note: The duplex printing unit requires a minimum of 12 MB memory in the printer. For instructions on adding printer RAM, see pages 152-158 in your LaserWriter 12/640 PS User's Guide.

If you want to	You need this much printer memory
Turn on PhotoGrade or use the duplex printing option	12 MB
Turn on PhotoGrade and duplex print on all size paper (except legal)	20 MB
Turn on PhotoGrade and duplex print on all size paper (including legal)	24 MB

Follow these instructions for installing the LaserWriter 12/640 PS duplex printing unit.

Before you install the duplex printing unit:

- The printer must be turned off and the power cord unplugged.
- The printer must be disconnected from your computer or network.

The duplex printing unit adds approximately 2 inches to the height and 4 inches to the depth of the LaserWriter 12/640 PS. Begin by selecting a location for the LaserWriter 12/640 PS that provides enough room to accommodate the increased height and depth of the printer.

If you intend to keep the printer in its current location, make sure that adequate room will be available for opening the top cover and the duplex printing unit door, and maintaining the printer. You will also need to temporarily move the LaserWriter 12/640 PS from its current location to place the duplex printing unit in its place. When moving the printer, be sure to place it on a strong, flat, and, stable surface that can support its weight.

IMPORTANT:
You must remove the optional 500-sheet cassette and feeder from the LaserWriter 12/640 PS if it is already attached. The duplex printing unit must be installed between the LaserWriter 12/640 PS and the 500-sheet cassette and feeder. For instructions on removing the 500-sheet cassette and feeder, see "Removing the 500-sheet Cassette and Feeder" later in this chapter.

1) Turn off and unplug the printer, and disconnect the network cables.
2) Unpack the duplex printing unit and remove any packing materials. Set aside the small package of items.
3) Lift up the back end of the duplex printing unit and slide the metal brace onto the post.

The brace is located on the left side of the duplex printing unit near the back.

4) Unpack the duplex printing unit key.

5) Remove the three covers located in the back of the printer. Remove the two top covers by inserting the key into the side of the covers and pushing gently on the key (the covers will snap off). Remove the bottom cover by inserting the key into the bottom side of the cover and pushing downward (you may need to use some force to remove this cover.)

IMPORTANT: Be careful when removing the covers so that they do not fall inside the LaserWriter 12/640 PS.

6) Place the bottom cover and the duplex printing unit key in a safe place in case you need them in the future.

If you decide to remove the duplex printing unit, use the cover to prevent dust and other material from getting inside the printer.

7) Place the duplex printing unit where you want the LaserWriter 12/640 PS to be located.

Orient the duplex printing unit so that its tray and the printer's multipurpose tray and paper cassette will be on the same side when the printer is attached.

8) Insert the paper guide for the duplex printing unit into the opening in back of the printer.

Hint: There are two tabs on the bottom of the paper guide that fit into slots in the back of the printer. When inserting the paper guide, slide it back and forth to easily locate these slots.

The paper guide helps direct the paper to the duplex printing unit.

9) Insert the locking connectors into the slots located on the bottom of the paper guide and push the connectors until they snap into place.

The locking connectors secure the paper guide to the printer.

10) Lift the LaserWriter 12/640 PS, position it directly over the duplex printing unit and gently lower the printer until it sits evenly on the duplex printing unit.

As you lower the printer, align the corners of the printer directly over those of the duplex printing unit.

11) Remove the cassette from the printer and the tray from the duplex printing unit.

12) Insert the four locking connectors into the slots located on the front and back of the printer and duplex printing unit.

The locking connectors secure the printer to the duplex printing unit.

13) Insert the cassette into the printer and the tray into the duplex printing unit.

14) Gently close the duplex printing unit door until it latches into place against the printer. If the door does not close easily, check to make sure the brace is not locked in place.

15) Reconnect the power cable to the printer and reconnect the printer to the network, then turn on the printer.

16) Configure your printer to use the duplex printing unit.

LaserWriter 12/640 PS: Duplex Option Dimmed

I installed the optional duplexer on my LaserWriter 12/640 PS printer, but the duplex option is dimmed. How do I use the duplex option?
This article has been archived and is no longer updated by Apple.
In order to use the optional duplex accessory, you must have a minimum of 12MB of RAM in your LaserWriter 12/640 PS printer. The table below shows the options available depending on the amount of RAM you have installed. The LaserWriter 12/640 PS printer uses industry standard 72-pin SIMMs (70ns or faster). The Tech Info Library article titled "LaserWriter 12/640 PS: Memory Configurations" contains a complete list of possible memory configurations.

RAM Installed	Options Available
4MB (Standard)	None. You cannot access either PhotoGrade or duplex printing.
12MB	You can enable either PhotoGrade OR duplex printing.
20MB	You can enable both PhotoGrade and duplex printing. Duplex printing is available up to US letter.
24MB and greater	You can enable both PhotoGrade and duplex printing. Duplex printing is available for all paper sizes including US legal.

Note: Additional memory also enables you to download additional fonts and provides greater document caching.
Published Date: Feb 20, 2012

LaserWriter 12/640 PS: Memory Configurations

This article contains the possible memory configurations of the LaserWriter 12/640 PS printer.
This article has been archived and is no longer updated by Apple.
The LaserWriter 12/640 PS printer ships with 4MB of RAM. Installing additional memory provides additional features.

RAM Installed	Options Available
4MB (Standard)	None. You cannot access either PhotoGrade or duplex printing.
12MB	You can enable either PhotoGrade OR duplex printing.
20MB	You can enable both PhotoGrade and duplex printing. Duplex printing is available up to US letter.
24MB and greater	You can enable both PhotoGrade and duplex printing. Duplex printing is available for all paper sizes including US legal.

Note: Additional memory also enables you to download additional fonts and provides greater document caching.

RAM Upgrade Specifications
To increase the printer's RAM, purchase SIMMs with the following specifications:

SIMM Dimensions

- Length: 107.95 mm +/- 0.20 mm (4.25 in. +/- .008)
- Height: 25.53 mm (1.005 in.) maximum

SIMM Sizes and Speeds

SIMM Size	Configuration	Speed	Connector type
4 MB SIMM	1 M X 32 bit (one 4 MB bank)	70 ns or less	72-pin
8 MB SIMM	2 M X 32 bit (two 4 MB banks)	70 ns or less	72-pin
16 MB SIMM*	4 M X 32 bit (one 16 MB bank)	70 ns or less	72-pin
32 MB SIMM*	8 M X 32 bit (two 16 MB banks)	70 ns or less	72-pin
* Must have a 2 KB row (11 bit x 11 bit) refresh configuration. 16 MB SIMMs with a 4 KB row (10 bit X 12 bit) refresh configuration are not compatible with the printer.			

Installing RAM
Your printer comes with 4 MB of RAM installed in Bank A/B. The table below lists RAM configurations you can use.

Amount of Memory (megabytes)	Bank C/D (left slot)	Bank A/B (right slot)
4 MB	0 MB	4 MB
8 MB	4 MB	4 MB
	0 MB	8 MB
12 MB	4 MB	8 MB
	8 MB	4 MB
16 MB	8 MB	8 MB
	0 MB	16 MB
20 MB	4 MB	16 MB
24 MB	8 MB	16 MB
32 MB	16 MB	16 MB
	0 MB	32 MB
36 MB	4 MB	32 MB
40 MB	8 MB	32 MB
48 MB	16 MB	32 MB
	32 MB	16 MB

64 MB	32 MB	32 MB

Note: Pages 152-158 in the LaserWriter 12/640 User's Guide provides detailed instructions on installing additional memory in your LaserWriter printer.

LaserWriter 8.4: Read Me Document

This article contains the LaserWriter 8.4 Readme document released in 1996-06-14.

This article has been archived and is no longer updated by Apple.

About Your Apple LaserWriter Printer Software for the Mac OS.

This document contains some important reminders and some information about your Apple LaserWriter Printer Software for Mac OS-based computers. You may want to print this document and keep it for future reference. The topics are:

* Desktop PrintMonitor Version 2.0

* Apple Printer Utility Version 2.1

* LaserWriter 8 Printer Driver Version 8.4

Desktop PrintMonitor Version 2.0

New Features in Version 2.0

* Desktop printer icons can be moved off the desktop and into folders.
* A printer menu located on the right-hand side of the menu bar provides a convenient means to switch the user's default printer (custom install).
* A control strip module with functionality identical to the printer menu is provided for PowerBook systems and other systems employing the Control Strip software.
* Enhanced user interface.

Hints and Shortcuts

* The Desktop Printers folder in the Apple Menu provides a convenient shortcut to desktop printers. This is especially helpful if you have moved your desktop printer icons off the desktop.
* Command-L key combination is a shortcut equivalent to the Set Default Printer command in the Printing menu.
* Holding down the Option and Shift keys makes the Hold and Resume buttons function as Stop Print Queue and Start Print Queue.
* To print additional copies of a file, you can select the spool file waiting in the print queue and choose Duplicate from the File menu.

Creating Desktop Printers

To create a desktop printer, select a printer in the Chooser and click the Create/Setup button. If you have System 7.5 or later, you can create multiple desktop printers from within the Chooser, but if you're running an older version of system software, you can only create one desktop printer per Chooser session.

System Software Requirements for Desktop Printing

Desktop printing requires System 7.1 or later of the Macintosh Operating System (Mac OS). If you have System 7.0 or earlier and you want to use desktop printing, you can upgrade your Mac OS-based computer to use a later version of system software. Contact your Apple-authorized dealer.

Using Desktop PrintMonitor on a Non-English System

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an earlier version of the PrintMonitor. Later versions of the PrintMonitor are not replaced.) You have three choices:
* Use PrintMonitor 7.1.2 (or a later version).
* Obtain a set of installation disks for the printer software in the language of your system software from your Apple-authorized dealer and install it.
* Upgrade your system software to System 7.5.1 and install the printing software again. An English language version of the Desktop PrintMonitor software is installed.

Using the Desktop Printer Menu and the Printer Selector Control Strip

The desktop printer menu extension can be installed using the Custom Install option.

The Desktop Printer menu appears on the right-hand side of your menu bar. It will normally appear to the immediate left of the Guide menu. The Desktop Printer menu lists the names of all active desktop printers. A check mark is displayed next to the name of the default printer. Selecting the

name of a printer from this list makes the printer the new default.

The Printer Selector control strip module is installed only on computers that already have control strip software installed. The Printer Selector adds an item to the control strip that provides functionality identical to the Desktop Printer menu.

Support and Compatibility Information

* Some third-party printers do not support desktop printing. If your printer is not an Apple product, and no desktop printer icon is created after you select your printer in the Chooser, it is likely that your printer does not support Desktop PrintMonitor. Please contact the vendor of your printer to see if there is a version of the driver that is compatible with Desktop PrintMonitor.

* When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

* Desktop PrintMonitor supports drag-and-drop printing for all files that cause the Print Command in the File menu to become enabled. Since clipping files do not enable the Print command, drag and drop printing is not supported for them.

* Apple's Fax Sender software is not supported by Desktop PrintMonitor. Fax Sender is fully functional when Desktop PrintMonitor is installed, however, it does not get the benefit of Desktop PrintMonitor's features. When you select Fax Sender in the Chooser you will not have a default desktop printer until you choose a printer icon and select "Set Default Printer" from the Printing menu.

* Spool files and desktop printers must use the same version of the LaserWriter 8 driver. You may encounter errors if you drag spool files that were created with one version of LaserWriter 8 to a desktop printer created with another version of the LaserWriter 8 driver.

Tips for Desktop Printing Troubleshooting

Error message "-192" or "15"

* Problem: After installing Desktop PrintMonitor and restarting your Mac OS computer you see error messages "-192" or "15" when you try opening files or folders in the Finder. This may occur when Now Startup Manager's preferences file has become corrupted.

Solution: Restart your computer with extensions disabled (hold down the Shift key while restarting), delete Now Startup Manager's preferences file, and restart the computer again with extensions enabled. Important: Before deleting your Now Norton Startup preferences, you may want to record them or write them down before you delete this file.

Desktop printer cannot be found

* Problem: When you try to print, your spool files are moved to the Trash and an alert is displayed saying that the desktop printer could not be found.

Solution: There are two likely solutions to this problem. First, it is possible that your desktop printer has somehow become damaged. To fix this, drag the desktop printer icon to the Trash and reselect the printer in the Chooser. A new desktop printer icon will be created.

Second, your printer software may not be using a file format that is completely compatible with Desktop PrintMonitor. If your printer software is not published by either Apple Computer or Adobe Systems, it is possible that it is not making proper and legitimate use of PrintMonitor. If this is the case, your printer software will not work properly with Desktop PrintMonitor. The only resolution to this problem is to disable Desktop PrintMonitor and use old PrintMonitor.To print the documents you were working on follow these steps:

1. Empty the Trash.
2. Go to the Chooser and turn off background printing.
3. Print documents again.

To correct desktop printing:

4. Drag the desktop printer to the Trash.
5. Go to the Chooser and turn background printing back on.
6. Create a new desktop printer.

Not enough memory message when dragging files to desktop printer

* Problem: When you drag documents created by different software applications to your desktop printer icon, a message is displayed indicating that there is not enough memory to continue.

Solution: You may not have enough memory available to launch all of the software applications corresponding to the documents you have selected. You can resolve this situation by printing your documents individually or in smaller groups.

Options dimmed in Printing menu

* Problem: "Get Printer Info" and "Change Setup" appear in your Printing menu, but can't be selected.

Solution: These are two new functions supported by LaserWriter v8.4. If these or other items in the menu appear dimmed and cannot be selected, it is because you are using a version of the printing software that doesn't support their respective functions.

Apple Printer Utility Version 2.1

The Apple Printer Utility program works with all Apple PostScript Level 2 printers.

Printing the Font Sample List

Duplicate fonts in the printer's ROM, RAM or hard disk, may not print on the font sample sheet and font totals may be incorrect. However, these fonts are available and will print correctly on any documents printed by the user. Note: the hard disk option is not available for all Apple printers.

Working with a Large Number of Downloaded Fonts

If you plan on working with a large number of downloaded fonts, you will need to increase the memory allocation for the Apple Printer Utility. To do this, quit the Apple Printer Utility, select its icon and choose Get Info from the File menu. Increase the memory in the Preferred Size box, then close the Get Info window. The amount of memory required grows dynamically as the number of fonts in the printer increase. Increase the Apple Printer Utility's Preferred Size memory by 100K to 500K and try printing again.

Working with Kanji Systems

The script mode changes to Kotoeri when clicking into an input field. To recover from this problem select a one-byte script from the script menu in the upper right corner of the screen.

Working with Kanji/Japanese Fonts

Downloading Kanji fonts is not a supported feature of this software and program errors may occur. Increase the Apple Printer Utility's Preferred Size memory by the size of each Kanji font you want to download.

Downloading PostScript Fonts on a GX System With the Apple Printer Utility

When GX is installed, any PostScript fonts (often called Type 1 fonts) in the Fonts folder are converted to GX fonts, and the original PostScript fonts are copied to a new folder called *Archived Type 1 Fonts* which is created in the System Folder. If you want to download these fonts to your printer using the Apple Printer Utility, you must send the fonts in the *Archived Type 1 Fonts* folder, not the GX-converted versions in the Fonts folder. Downloading GX fonts that were not previously Type 1 fonts and converted by GX works correctly.

Removing Fonts From a Hard Disk Attached to a Printer

This paragraph is relevant if you are using a printer that will have a hard disk drive attached to it. The LaserWriter 12/640 PS does not support a hard disk drive attachment.

If a font is downloaded to both the printer's RAM and the printer's hard disk with the same name, and you remove the font on the hard disk, the RAM font will also be removed. If you remove the RAM font, the font on the hard disk will not be removed.

LaserWriter 8 Printer Driver Version 8.4

The software includes version 8.4 of the Apple LaserWriter 8 printer driver, which works with many Apple LaserWriter printers. This section contains information about LaserWriter 8 and information on using it with several of the printers.

What's New in Version 8.4

LaserWriter 8.4 provides a new user interface that is simpler and easier to use. It also provides single-pass printing for foreground print jobs, more background printing options, and more layout options.

Larger Print Area

Some printers support both US Letter and US Letter Small paper sizes. To prevent text from clipping or wrapping to the next line on different printers, use US Letter Small. To get the widest possible margins from your printer model, use US Letter.

Using PostScript Fax

PostScript Fax is an option for the LaserWriter Select 360, the LaserWriter 16/600 PS, and the LaserWriter Pro 810. If you use a PostScript Fax option with any of these printers, you should use LaserWriter 8f version 8.2.3f. PostScript Fax is no longer supported with LaserWriter drivers 8.3.x and beyond. See the section "How To Get Updated Printer Software"at the end of this Read Me for information on obtaining LaserWriter 8f version 8.2.3f if you don't already have it.

Using Color Matching

When ColorSync 2.0 is installed and the ColorSync Profiles folder contains printer profile(s), there are two options in addition to color/grayscale output:

* PostScript Color Matching/Printer's Default is the preferred color-matching choice. When you are printing to a PostScript Level 2 printer, and it is efficient to let the printer do most of the work, this option is a good choice.

* ColorSync Color Matching is an alternative color-matching selection. It invokes the ColorSync system software to perform color matching for the printed document, matching your monitor and printer's profile and sending the correct color information to the printer. With ColorSync Color Matching, most of the work is done by your Macintosh.

Here are some tips on using color matching:

* Color output will vary depending on the application you are using.

* Documents that use ColorSync 1.0 embedded profiles convert to the profile set up in the ColorSync 2.0 System Profile control panel.

* When you print with PostScript Color Matching selected and ColorSync 2.0 is not installed, the driver uses the Apple 13" RGB Standard profile.

* Application programs that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT file corrects the problem.

PPD Files

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, you need to go through a simple setup procedure. When selecting your printer for the first time, or after installing an additional option, click the Create/Setup button in the Chooser. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

If you get an error about the preferences file when you choose an option that is specific to your printer, you may have an outdated PPD file. You should contact the vendor of your printer for an update.

Creating EPS Files

You can create an encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

* Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, you may create an extremely large file.

* If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.

* When you create EPS files with preview information included, other programs that create their own PostScript code may not display the EPS file accurately on the screen.

Using the LaserWriter 8 Driver With the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.5.1 or later.

Using QuickDraw GX Fonts on a non-QuickDraw GX System

If you are using the QuickDraw GX versions of the fonts Hoefler Text or Skia with a non-QuickDraw GX system, you may encounter line-layout problems on screen or with your print-outs.

Using the LaserWriter 8 Driver With Applications

Some programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that may result in printing problems. If you experience problems with an application, please contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some applications. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

* Foreground vs Background Printing: LaserWriter 8.4 offers both foreground and background printing. In foreground, LaserWriter 8.4 doesn't spool the file being printed. An application may fail when printing in the foreground if the application assumes the driver will make a spool file.

When printing in the foreground you may experience problems with these applications: Persuasion, Photoshop, PowerPoint 4.0, Excel 5.0, Quicken, PageMaker 6.0, ClarisDraw, and Claris Impact.

If you experience problems with foreground printing, change to background printing and try again.

* Color output will vary depending on the application you are using.

* With many application programs, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.

* Some programs may print in color even when Black and White mode is selected.

* Programs that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT corrects the problem.

* Tray Selection: Applications that don't utilize LaserWriter 8.4's new capabilities have some limitations with tray selection when printing from Finder. To work around these problems, print from within the application and contract the vendor of the application.

Adobe Acrobat 2.1

* Acrobat retains the settings used for one printout and applies these settings to subsequent print jobs, unless options are reset by the users.

Adobe Illustrator 5.5

* Multiple-page documents may not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

Adobe Type Manager 3.9

* Documents may sometimes generate PostScript errors when printing outline fonts frm a Macintosh 9500 using ATM 3.9. This can be fixed by replacing ATM 3.9 with an earlier version.

Aldus Freehand 4.0 & Freehand 5.0

* Documents do not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

Aldus PageMaker 5.0

* Documents that have been set up using a page layout from the Layout pop-up menu may not print correctly with the Print-Option command; use the Print command with PageMaker's Thumbnail option.

* When using a page layout from the Layout pop-up menu with the Print-Option command, the document will be printed in reverse order.

* Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
* You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus SuperPaint 3.5

* Rotated or filled polygons print as solid gray objects.
* Gradient fills may not print when copied into other programs.

Canvas 3.5.2

* When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if you use the Geneva, New York, or Monaco fonts.

ClarisDraw 1.0

* Some shapes that contain gradients may not print correctly.

CricketPresents 2.1

* You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

DeltaGraph Pro 3.0.4

* Printing with Unlimited Downloadable Fonts may cause some elements to be shifted and fonts to substitute Courier.

FileMaker Pro 2.1

* When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Informed Designer/Manager 1.4.2

* Do not print documents that contain JPEG images in Black and White mode; your system will restart.

* When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

MacDraw Pro 1.5

* Rotated text within a frame that is placed in another application may not print correctly.

Microsoft Excel 5.0

* Colored horizontal cell borders will often not appear in the printout. This happens with any color printing option and on most printers.

* When you select Page Setup, Excel displays its own dialog box. Click the Options button to open the Page Setup dialog box generated by the LaserWriter driver. Most of the settings in Excel's window match the corresponding option in the driver's window. However, the scaling size may be different in the two dialog boxes. The size displayed in the Excel window is the size that will be used when you print from Excel.

Microsoft PowerPoint 3.0

* Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0

* Printing documents that have rotated objects with rounded corners results in a PostScript error.

Microsoft Works 4.0

* Works 4.0 color print outs may not match what appears on your screen. Experiment with the color options to determine which one generates the best printout for your needs.

Microsoft Word 6.0

* Each section of a document is treated as a separate file when printed.

Netscape 2.0.1

* Netscape may print a pale gray background to an older LaserWriter printer.

* When printing a multiple-page document, Netscape may print below the margins on the intermediate pages.

* Graphics that seem to be transparent on screen will be printed on your documents.

Painter 3.0

* When you print using the Invert option, images do not print inverted correctly.

QuarkXPress 3.3.1

* Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
* Some imported JPEG files may not print correctly.

RagTime 3.2

* You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0

* Use ReadySetGo! version 6.0 or later with the LaserWriter 8 printer driver; earlier versions will not work.
* With the Unlimited Downloadable Fonts option selected, you may not be able to print complex documents.
* Documents that use pen patterns will print patterns as solid gray.

How to Get Updated Software

Apple Software Updates are available on CompuServe (GO APLSUP), America Online (keyword: applecomputer), and on the Internet at:

LaserWriter 12/640 PS: Acceptable Paper Sizes & Weights

What paper sizes and weights can I use in the LaserWriter 12/640 PS?
This article has been archived and is no longer updated by Apple.
The LaserWriter 12/640 supports US Letter, A4, B5, Executive and US Legal sized paper in the standard (250 sheet) cassette. The multipurpose tray can hold 80 sheets of standard US Letter paper and other paper sizes from postcard to US Legal. An optional 500 sheet cassette is available that supports US Letter, A4, and US Legal. An envelope cassette that can automatically feed up to 50 envelopes is also available.

The LaserWriter 12/640 PS supports 16 to 28 pound laser quality bond (60-90g/m^2) in the paper cassettes and up to 50 pound (190g/m^2) stock when fed manually through the multipurpose tray and exited through the face-up output tray. This printer also accepts most textured and colored stock, medium-weight photocopier transparencies, and laser labels. Envelopes can be printed from the multipurpose tray or from the optional envelope cassette.

The paper you use should not scorch, melt, transfer material, or release hazardous emissions when heated to 200 C (393F) for 0.1 seconds.

Paper type and size:

Paper Type	Size
US Letter	8 1/2 x 11" (215.9 x 279.4 mm)
US Letter Small	8 1/2 x 11" (215.9 x 279.4 mm)
US Legal	8 1/2 x 14" (215.9 x 355.6 mm)
US Legal Small	8 1/2 x 14" (215.9 x 355.6 mm)
A4	8.27 x 11.69" (210 x 297 mm)
A4 Small	8.27 x 11.69" (210 x 297 mm)
A5	5.84 x 8.26" (148 x 210 mm)
Executive	7 1/4 x 10 1/2 (184.2 x 266.7 mm)
B5	7.17 x 10 1/2" (182 x 257 mm)

Envelope sizes and weights:

Envelope	Weight	Size
Comm 10	24 lb	4 1/8 x 9 1/2" (104.7 x 241.3 mm)
Monarch	24 lb	3 7/8 x 7 1/2" (98.4 x 190.5 mm)
EuroPostcard	50lb	4.13 x 5.83" (105 x 148 mm)
DL	80g/m^2	110 x 220 mm
C5	90g/m^2	162 x 229 mm

RealAudio: Number of Simultaneous Streams

This article describes the number of simultaneous streams RealAudio supports on Apple Internet Software Solution server computers.
This article has been archived and is no longer updated by Apple.
The RealAudio software which shipped with the Apple Internet Software Solution has a 5 user license. The following are excerpts from the Administration Guide that come with the product:

Streams
The RealAudio Server and the accompanying encoding application enable you to create and deliver RealAudio content. The number of simultaneous users who can listen to content sent from your server at any given time is referred to as the "number of streams." The number of streams a server can deliver depends upon three factors: the type of RealAudio Server you have, the power of your Server computer, and the bandwidth between your Server and the Internet (each audio stream requires 10 KB per second of network bandwidth).

The maximum number of simultaneous audio connections your server can support is five. This entry allows you to set a limit less than or equal to this number. To specify a different value, enter it into the Audio field. The maximum number of connections cannot usefully exceed the maximum number that the bandwidth of your Internet connection will support.

LaserWriter 12/640 PS: Paper Sizes & Imageable Area

This article lists the page sizes and imageable areas for the LaserWriter 12/640 PS printer.

This article has been archived and is no longer updated by Apple.
The LaserWriter 12/640 PS printer supports the following page sizes and imageable areas:

Paper Type	Physical Page Size (points)	Imageable Area (points)
Letter	612 x 792	587.52 x 767.88
Lettersmall	612 x 792	562 x 742
Legal	612 x 1008	587.52 x 983.88
Legalsmall	612 x 1008	562 x 958
A4	595 x 842	572.16 x 817.8
A4small	595 x 842	545 x 792
A5	420 x 595	399.36 x 570.84
B5 (JIS)	516 x 729	491.52 x 704.88
Executive	522 x 756	499.2 x 732.48
EuroPostCard	284 x 420	272.64 x 391.50

Envelope Type	Physical Size (points)	Imageable Area (points)
COM-10	297 x 684	272.64 x 656
Monarch	279 x 540	257.28 x 512
C5	459 x 649	433.92 x 621
DL	312 x 624	288 x 596

Notes:

- The fractions are due to conversion from pixels to points.
- To convert from points to inches divide the number by 72 (1 inch = 72 points).

LaserWriter Printable Area Margins

- Left = 4.0 mm (0.157 in or 11.34 points)
- Right = 4.0 mm (0.157 in or 11.34 points)
- Top = 4.0 mm (0.157 in or 11.34 points)
- Bottom = 4.0 mm (0.157 in or 11.34 points)
- For heavy paper (Postcard and Envelopes) the top margin is 6.00 mm.
- Maximum printable line: 208 mm (8.19 in) standard mode
- The default paper size is lettersmall.

Network Assistant 4.0.x: Sys Information Report Maximum Width

I am using Network Assistant to create a System Information report for the Macintosh computers on my network. I have a maximum of 630 pixels that can be used for the report. How can I efficiently predetermine the items I want to select for a report and stay within the 630 pixel maximum?
This article has been archived and is no longer updated by Apple.
The maximum width of the System Information report is determined by the resolution of your monitor. When the screen resolution is 640 X 480 the maximum width of the report is 630 pixels. If the screen resolution is set to 1024 X 768 the maximum width of the report is 1,014 pixels.

The workstation is always the first field in the report. When you generate a new report, this field along with the report window require 167 pixels. When the monitor resolution is set to 640 x 480, you have 463 Pixels for the remaining fields.

Since you are not going to be able to get all the fields into one report, a good strategy would be to generate reports with like fields. Multiple reports can be left open for on screen viewing.

You can also print or export the report to a text file. If you want to know more about printing or exporting a report please refer to Part 3 in the Apple Network Administrator Toolkit manual page 55 "Printing and Exporting to a text file".

The table below shows the number of pixels each field uses:

Field	Pixels	Field	Pixels
System SW Version	75	Mouse Connected	75
Built-In Memory	65	Keyboard Connected	75
Virtual Memory	65	Printer Type	130
System SW Memory	75	Printer Version	65
RAM Disk Size	75	Printer Name	130
Free Disk Space	75	Network Type	75
Total Disk Space	75	Appletalk Version	75
File Sharing	60	Appletalk Zone	130
Processor	85	Appletalk Network #	75
Monitor Size	85	Appletalk Node #	75
Monitor Setting	110	TCP/IP Address	110
2nd Monitor Size	85		
2nd Monitor Setting	110

Network Assistant 4.0.x: Talk - Requires Dual Channel Sound

Will the "Talk" feature in the Apple Network Administrator Toolkit work with all Macintosh computers?
This article has been archived and is no longer updated by Apple.
The "Talk" feature in the Apple Network Administrator Toolkit requires a Macintosh with dual channel sound capabilities that can record and playthrough sound at the same time.

The "Talk" feature will not work with the systems listed below:

Macintosh Classic
Macintosh Classic II
Macintosh Color Classic
Macintosh Color Classic II
Macintosh SE/30
Macintosh IIci
Macintosh IIvi
Macintosh IIvx
Macintosh LC
Macintosh LC II
Macintosh LC III
Macintosh LC 475
Macintosh LC 520
Macintosh LC 550
Macintosh LC 575
Macintosh Quadra 605

Macintosh Performa 200
Macintosh Performa 250
Macintosh Performa 275
Macintosh Performa 400
Macintosh Performa 405
Macintosh Performa 410
Macintosh Performa 430
Macintosh Performa 450
Macintosh Performa 460 Series
Macintosh Performa 475
Macintosh Performa 476
Macintosh Performa 520
Macintosh Performa 550
Macintosh Performa 560
Macintosh Performa 570 Series
Macintosh Performa 600 Series

Macintosh PowerBook Duo 200 Series
Macintosh PowerBook Duo 2300 *
Macintosh Duo MiniDock
Macintosh Duo Dock
Macintosh Duo Dock II
PowerBook Duo Dock Plus

* Although the Macintosh PowerBook Duo 2300 is able to record and playthrough sound simultaneously, the Talk feature is disabled on this system due to a software issue discovered late in the process.

Macintosh Computers: Available Options for lpr Printing

This article describes software that allows a Macintosh computer to print using lpr/lpd over an Ethernet network.
This article has been archived and is no longer updated by Apple.

LaserWriter 8.5.1 Driver Adds Support for IP Printing

With LaserWriter driver 8.5.1 and later you can print to IP-capable Apple LaserWriters using the LPR protocol. The minimum system requirements for LPR printing with LaserWriter 8.5.1 are:

- a Macintosh computer with a 68030 processor
- System 7.5 or later

Download LaserWriter 8.5.1 or later software from Apple Software Updates at http://www.apple.com/swupdates/. The LaserWriter 8.5.1 driver can be found within the Older Software Download section.

Energy Saver Sleep Settings: Stored in Preferences Not PRAM

This article discusses where the settings for Energy Saver sleep and default sleep time are stored.
This article has been archived and is no longer updated by Apple.

Energy Saver sleep settings

Energy Saver sleep settings on PCI-based Macintosh computers are stored in the Energy Saver Preferences file, not parameter RAM (PRAM). The Energy Saver Preferences file is located in the Preferences folder within the System Folder.

Energy Saver default sleep time

Moving or discarding the Energy Saver Preference file and restarting the computer resets the Energy Saver control panel to the default sleep time of 30 minutes.

Additional information

With some Mac OS versions, the Energy Saver control panel may place an alias of itself in the Startup Items folder if no preference file exists. Once the control panel is opened, the alias is removed from the Startup Items folder and a preference file is created. Mac OS 9 and later creates a default preference file without opening the control panel at system startup time.

Published Date: Feb 20, 2012

Energy Saver Modes: Different Sleep Modes Explained

If I choose Sleep from the Special menu on my computer, it powers down my monitor and the monitor cools down. However, if I use the timed delay sleep mode in the Energy Saver control panel, the video signal disappears, but the monitor never cools. Why?
This article has been archived and is no longer updated by Apple.
There is a difference in the way the two sleep functions work. Choosing the Sleep mode from the Special menu puts the monitor into a low-power state, but using the Energy Saver software merely blanks the video with composite and vertical sync. still present.

The Energy Saver Control Panel was designed this way so that you would not have to wait a long time for the display to warm up from a cold start if the Display sleep was set separately at under 30 minutes.

Below is a table showing the video signals in the various modes.

Pin	Signal	Description	W/Video	Sleep Menu	Energy Saver
1	RED.GND	Red vid. ground	GND	GND	GND
2	RED.VID	Red vid. signal	Video	No video	No video
3	/CSYNC	Comp. sync. signal	*Sync.	No sync.	Sync.
4	SENSE0	Monitor sense 0	--	--	--
5	GRN.VID	Green vid. signal	Video	No video	No video
6	GRN.GND	Green vid. ground	GND	GND	GND
7	SENSE1	Monitor sense 1	--	--	--
8	+12V	12-volt from computer	Sync.	No sync.	No sync.
9	BLU.VID	Blue vid. signal	Video	No video	No video
10	SENSE2	Monitor sense 2	--	--	--
11	GND	CSYNC & VSYNC ground	GND	GND	GND
12	/VSYNC	Vertical sync.	*Sync.	No sync	Sync.
13	BLU.GND	Blue video ground	GND	GND	GND
14	HSYNC.GND	HSYNC ground	GND	GND	GND
15	/HSYNC	Horizontal sync.	Sync.	No sync.	No Sync.

Note:
Bullets (*) indicate where the differences are in the two sleep functions.

Going Into a True Sleep Mode (No Power)

Here is one method you can use to have the display go into a true sleep mode (no power).

Step 1
Open the Energy Saver control panel

Step 2
Set the System sleep option to the minimum value (30 minutes).

Step 3
If you want the display to go into a low-power sleep mode (loss of video only) then select display sleep and set the time for under 30 minutes. If

you want the display to go into a true sleep mode (loss of power), deselect display sleep and have the system sleep set at 30 minutes or greater. If you have an option for never, all three options for sleep including the display are set for never.

Step 4
Close the Energy Saver control panel

The CPU sleep blanks all Video, Horizontal and Vertical Sync, and Composite Sync. With the display sleep function selected and set at under 30 minutes, you lose only video and composite sync. The display will not lose power until the CPU goes to sleep.

Network Assistant 4.0.x: Control Window Behavior

This article contains questions and answers concerning Network Assistant's Control Window behavior.
This article has been archived and is no longer updated by Apple.
Question: Should the user be getting a full screen view when trying to control a single workstation from the multiple view observation window, or is documentation incorrect?

Answer: The screen you will be controlling will fill the 640 x 480 "observing" window, not the whole screen unless your administrator's station has only a 640 x 480 screen. Here, the manual is correct.

Question: When you can see a partial desktop is there a way to scroll around to observe or control the entire desktop?

Answer: No.

The Network Administrator Toolkit (ANAT) Read Me says that if you view a workstation with a smaller monitor, you will see only part of the shared screen. Also, if you share, control or observe a workstation that has a larger display (or bit depth greater than the administrator display) then you will see only part of the shared display. This can be an issue in that you may not see the Hard Disk of the remote Macintosh. A possible workaround would be to type the name of the hard disk and use the Finders "open" command. This may allow you to see the contents of the window if the window is not off the viewable display.

Question: Can I use other applications on my computer while I am controlling another computer?

Answer: No. The documentation states in Section 3 page 84, "You cannot use other applications on your workstation while using the control feature."

Question: What are the requirements for the administrators workstation monitor?

Answer: If you share, control or observe a workstation, the administrators workstation monitor should have an equal or higher resolution than the remote workstation.

Question: Are there any restrictions for the workstation monitor?

Answer: You cannot observe, control or share a display that is displaying millions of colors. If the colors on the workstation monitor are set to millions, you can use the "Change System Settings" feature to adjust colors below millions.

Network Assistant 4.0.x: Using the Network Performance Report

This article comes from the Apple Network Administrator Toolkit (ANAT) manual and describes how the information from the Network Performance Report can be used.
This article has been archived and is no longer updated by Apple.
The Network Performance Report includes information that can be use to evaluate the performance of your network. Here are some suggestions for using the Network Performance Report:

- The number of routers between your workstation and another workstation can affect the time the packets take to return. When you evaluate the times for a workstation, you should compare them to the times for a workstation in the same area of the network or with the same number of intervening routers.
- If the number of routers is not what you expect, there may be a network issue.
- If the maximum time for a packet to return from a workstation is significantly greater than the times for other workstations in the same area of your network, there may be a workstation issue.
- If a single workstation has many lost packets, there may be a problem with the network connection to that workstation.
- If several workstations in the same area of the network have many lost packets, there may be a network connection issue or an intervening router or bridge issue.

Published Date: Feb 20, 2012

Network Assistant 4.0.x: Interpreting Status Messages

This article describes what the Network Assistant, part of the Apple Network Administrator Toolkit (ANAT) workstation, status messages mean and how to respond to them.
This article has been archived and is no longer updated by Apple.
The Workstation Status window shows you the name and the status of each workstation in a list of workstations. Usually the status is the name of the application program running on each workstation, but other messages may appear in the Status column.

If a message appears in red, the last command you tried to execute on a particular workstation failed. These messages remain in the Status column for about 30 seconds, or until you perform another command on the workstation.

Access denied

The password for this workstation is no longer valid. If you know the new password for the workstation, choose Workstations from the Setup menu and use the Workstations dialog box to remove the workstation from the list then add it to the list again, entering the new password when requested.

Applications are open
You tried to replace the System Folder or delete all of the other items on a workstation's hard disk when an application was open on the workstation. You must first quit all of the open applications on the workstation. Ask the user to quit all of the applications, or choose Quit Applications from the Manage menu to quit the applications. You can also choose Control from the Interact menu, then quit any open applications.

Application not found

You tried to open an application or a document of an application that is not installed on the workstation. Use the Copy Items command to copy the application to the workstation. (Make sure that your licensing agreement allows you to copy the application.)

AVP: Channel XX

The workstation is displaying TV channel XX using the Apple Video Player.

Command failed

The last command failed to execute on the workstation. This may be because of the applications that are open on the workstation. Ask the user to quit all of the applications, or choose Quit Applications from the Manage menu to quit the applications. You can also choose Control from the Interact menu, then quit any open applications. After you quit the applications, try the command again. If the command still fails, try restarting the workstation.

Command not authorized

You do not have permission to perform the command you tried on the workstation. Before you can use the command, either you or the user must change your access privileges on the workstation using Network Assistant Security. You may have permission to perform other commands on the workstation.

Communication error

Network Assistant was unable to send the last command to the workstation because the workstation is not operating properly or there was a high level of network activity. Create a Network Performance Report for this workstation and several workstations near it to determine whether there are issues communicating with this particular workstation. If the report indicates that all the workstations are performing at the same level, try the command again. If the command continues to fail, try restarting the workstation. If this issue occurs often, there may be a issue with your network.

Copying Items

This message appears when items are being copied to a workstation using Network Assistant. If the message is dimmed, the Copy Items or Copy Hard Disk command is being executed from another administrator's workstation.

Deleting Items

This message appears when items are being deleted from a workstation using Network Assistant. If the message is dimmed, the Delete Disk or Delete Selected Items command is being executed from another administrator's workstation. The workstation would not be available for other commands until it has finished deleting the items.

Disk Full

You tried to copy items to the workstation, using the Copy Items or Copy Hard Disk command, and it doesn't have enough free disk space for the

new items. To determine how much free disk space is available on the workstation, create a System Information Report. If you want to delete items from the workstation, you can create a Software Search Report and delete any unnecessary items. You can also choose Control from the Interact menu, then delete items from the workstation's hard disk.

File transfer error

An error prevented you from copying items to this workstation. Restart the workstation and try the command again. If this issue continues, use the Disk First Aid application (available on the Disk Tools disk or the system software CD-ROM that came with your computer) to check the workstation's hard disk.

Generating Report

This message appears when Network Assistant is creating a report that includes the workstation. If this message is dimmed, the report is being created from another administrator's workstation. The workstation would not be available for other commands until the report is complete.

Incompatible hardware

You tried to copy system software to a workstation that cannot support this software. You can copy the System Folder from a 680XX workstation only to other 680XX workstations. You can copy the System Folder from a Power Macintosh only to other Power Macintosh computers.

Incompatible printer

You tried to update printer settings on a workstation that has printing software different from that on your workstation. You can update the printer settings only on workstations that have the same printing software as your workstation. For example, if your workstation has QuickDraw GX installed, the other workstation must have QuickDraw GX installed.

Item exists

You tried to copy an item to a location on the workstation that has an item with the same name. After you cancel the copy command, this message indicates which workstations already have the item. Create a Software Search Report to find out more information about the item. You can then delete or replace it.

Item not found

You tried to open or delete an item that could not be found on the workstation. If you want to open the item on the workstation, choose Copy Items from the Manage menu to copy the item to the workstation.

Item in use

You tried to delete or replace an item on the workstation when the item is open or in use by an application. Ask the user to close the item or quit the application, or choose Quit Applications from the Manage menu to quit the application. You can also choose Control from the Interact menu, then close the item or quit the application. After you have closed the item or quit the application, try the command again. If the command continues to fail, try restarting the workstation.

Locked Screen

This message appears when a workstation's screen is locked using Network Assistant. Choose Lock Screen to unlock the screen. If the message is dimmed, the screen was locked from another administrator's workstation.

Modal dialog on screen

A dialog box appears on the workstation's screen and must be closed before the command can be performed on the workstation. Ask the user to close the dialog box. You can also choose Control from the Interact menu, then close the dialog box. Once the dialog box is closed, try the command again.

Monitor setting invalid

You tried to change the monitor settings for a workstation (using the Change System Settings command) to a number of colors that is not supported by that workstation.

Network Assistant open

Certain commands, such as Restart, Control, and Share Screen, cannot be executed on a workstation where Network Assistant is open. Ask the user to quit Network Assistant.

Not enough memory

There is not enough free random-access memory (RAM) on the workstation to execute the last command. Many of the commands you can perform on another workstation using Network Assistant require some memory on the other workstation. For example, sharing a screen can require several hundred kilobytes of free memory. To free memory on the workstation, ask the user to quit all open applications, or choose Quit Applications from the Manage menu to quit the applications. You may be able to choose Control from the Interact menu, then quit open applications. After you have quit the applications, try the command again.

Old Assistant software

This message appears when a workstation has a version of the Network Assistant workstation software that is older than the version of Network Assistant you are using. You must install the new version of the workstation software on the workstation before you can administer it.

Rebuilding Desktop

This message appears when the workstation's desktop database is being rebuilt using Network Assistant. If the message is dimmed, the Rebuild Desktop command was executed from another administrator's workstation. The workstation would not be available for other commands until rebuilding the desktop database is finished.

Screen: name

This message appears when the screen of workstation name is being displayed on this workstation's display. Choose Share Screen to stop sharing the screen on the workstation. If the message is dimmed, the Share Screen command was executed from another administrator's workstation.

Screen sharing active

Certain Network Assistant commands cannot be executed on a workstation that is currently using screen sharing. Before you can use this command, you must choose Share Screen from the Interact menu to stop screen sharing on the workstation.

Slow network connection

Your network connection does not support screen sharing, controlling, or observing. To use these features of Network Assistant, the workstations must be connected to Ethernet or another network of similar performance.

Sound hardware in use

You tried to talk to a workstation where an application is recording a sound using the computer's sound input hardware. Ask the user to stop recording sound on the workstation, then choose Talk from the Interact menu again.

Talk not supported

You tried to talk to a workstation that does not have a built-in microphone or does not allow you to play a sound while it is recording a sound. You can still use the announce feature of Network Assistant with the workstation.

Unable to delete item

The command to delete an item failed for an unknown reason. You may be able to choose Control from the Interact menu, then delete the item. If this fails, use the Disk First Aid application (available on the Disk Tools disk or the system software CD-ROM that came with your computer) to check the workstation's hard disk for issues.

Unavailable
This message appears when Network Assistant is unable to communicate with a workstation; for example, if the workstation is turned off. The message also appears in these cases:

- If the Network Assistant software has been removed from the workstation
- If there is an issue with the workstation's network connection
- If the workstation has moved to a different zone on the network
- If the workstation's Macintosh name has been changed

To fix these issues, perform the following procedures:

1. Open Network Assistant Security on the workstation to determine whether the Network Assistant software is installed correctly. If the software is not installed correctly, a message appears when you open the program telling you that there is a issue.

2. Open the Chooser on the workstation to see if the workstation is connected to the network and to verify that the workstation is in the zone it was in when you added it to the workstation list. If the workstation is in a different zone, choose Workstations from the Setup menu and use the Workstations dialog box to remove the workstation from the list then add it to the list again.

3. Open the Sharing Setup control panel on the workstation to verify that the Macintosh name has not changed since you added it to the

workstation list. If the workstation's Macintosh name has changed, choose Workstations from the Setup menu and use the Workstations dialog box to remove the workstation from the list, then add it to the list again. If you cannot identify the issue or the workstation continues to be unavailable, try restarting the workstation.

Network Assistant 4.0.x: Monty Python‘s Pythonizer Screen Saver

The Network Assistant, part of the Apple Network Administrator Toolkit (ANAT), seems to have a issue with Monty Python's Pythonizer Screen Saver. If a workstation is setup to be administered by Network Assistant, the workstation's status will show as 'Unavailable" when the screen saver is activated.
This article has been archived and is no longer updated by Apple.
Every 30 seconds, the computer running the Network Assistant application will poll the network to verify the availability of workstations configured under Network Assistant. Any workstations that fail to answer this "are you there" request will be marked unavailable. As the request is continually delivered, correcting for the workstation's inability to respond will automatically make it available again after a subsequent status request is answered.

It is possible (though uncommon) that an application may delay, prohibit, or otherwise interfere with other background processes, such as the process that allows the workstation to respond to this status request. Some applications preempt these background processes in order to allow the application to perform optimally for the user, though in such cases they will usually provide user-definable options to "allow background processes" or "monitor system activity," and the like. Check with the manufacturer of your software to confirm this possibility.

Finally, it could be that the software allows background processes, but is simply conflicts with the Network Assistant.

Network Assistant 4.0.x: Copying a Hard Disk

This article contains questions and answers about copying a hard disk using Apple Network Assistant.
This article has been archived and is no longer updated by Apple.
In addition to the steps below, Apple recommends that you download and install the Network Assistant 4.0.4 update, available from technical document **120050**.

Question: I have a two identical computers, and I am trying to copy the hard disk from one computer to another using the Apple Network Assistant, part of the Apple Network Administrator Toolkit (ANAT). I'm choosing All other items in the Copy Hard Disk dialog box. The target computer has a 400 MB hard disk; the information I am trying to copy is 390 MB. When I try to copy, I get a message that there is not enough space on the target disk to copy. What is wrong?

Answer: Make sure your target computer does not have virtual memory turned on. Virtual memory allocates space, for its use, on the hard disk in the amount set in the Memory control panel. Turn off virtual memory and restart; this should let you copy to the target computer.

Question: When using Network Assistant's "Copy Hard Disk" feature, it stops responding at the "Connecting" phase when copying the System Folder if: Network Assistant was opened from a mounted server volume or a floppy disk.

Answer: Open Network Assistant from the workstation hard disk instead of a mounted volume or floppy disk.

Macintosh Computers: Cause of CD-ROM Drive Vibration

This article describes a vibration that may be felt or heard when playing a CD in an 8X or faster CD-ROM drive.
This article has been archived and is no longer updated by Apple.
This behavior is not related to a particular computer model. Rather, it is related to the speed of the CD-ROM drive in the system.

CD-ROM drives running at 8x and faster spin CD-ROM discs very quickly. Because of the high rotational speed, CD-ROM discs with artwork or a label on one side are unbalanced and can cause the computer to vibrate. For example, the label on the CD-ROM disc may be noticeably thicker on one side than the other.

This vibration affects very few CD-ROM discs and does not damage your computer or the CD-ROM disc itself, but you should be aware of the vibration in case it occurs.

Note: This can affect all 8x or faster drives.

LaserWriter 12/640 PS: Paper jam light remains on

I had a paper jam in my LaserWriter 12/640 PS printer, however, after clearing the jam by following instructions in the manual, the jam light remains on. What is wrong?
This article has been archived and is no longer updated by Apple.
Check the following two places again because it is easy to miss jammed paper in these locations.

- Look carefully in the duplexer by removing the duplex tray and pivoting the vertical duplexer portion away, then look in the lower rear portion (removing the 250 cassette will also help in improving visibility).
- Remove the black diverter (it has two white clothes pin type clips on it) and look into the exit of the fuser region (WARNING: it may be hot in this region) for a potential accordion style paper jam. After removing the jammed paper from the fuser region, put the black diverter back into position with the two white clothes pin type clips.

LaserWriter 12/640 PS: Communication Switch Settings

This article contains the settings for the communication switch on the back of the LaserWriter 12/640 PS printer.

This article has been archived and is no longer updated by Apple.
The following table shows the default communication settings.

Normal (in) Switch Position

Port	Network Protocol	Mode	Default
LocalTalk	LocalTalk	PostScript	PostScript
Ethernet	EtherTalk	PostScript, off	PostScript
Ethernet	NetWare	PostScript, PCL5, Auto, off	Auto
Ethernet	TCP/IP	PostScript, PCL5, Auto, off	Auto
Parallel	TBCP	PostScript, PCL5, Auto, off	Auto
Parallel	Normal	PostScript, off	PostScript
Parallel	Raw	PostScript, PCL5, Auto, off	Auto

Reset (out) Switch Position

Port	Network Protocol	Mode
LocalTalk	LocalTalk	PostScript
Ethernet	EtherTalk	PostScript
Ethernet	NetWare	Auto Select
Ethernet	TCP/IP	Auto Select
Parallel	Parallel	Auto Select

Note: When the communication switch is set in the Reset position, a startup page is printed each time the printer is turned on and the Extended Job Status settings are removed.

LaserWriter 12/640 PS: Paper Weight for Duplexer

The specifications in the LaserWriter 12/640 PS User's Guide for paper weight are confusing. The User's Guide, in a section about the duplexer, mentions 16-24lb paper is supported from the cassette and 16-32lb from the manual feed slot. The page listing the specifications of the LaserWriter lists 50lb paper through the manual feed slot.

Does the LaserWriter 12/640 PS printer support a different range of paper depending on where the paper is feed from? Also, does the duplexer support irregular paper sizes if my application does?
This article has been archived and is no longer updated by Apple.
The LaserWriter 12/640 PS User's Guide is a little confusing. Here are the correct specifications for paper used with this printer.

Printer from paper cassette (either 250 or 500 sheet feeder): 16lb to 28lb

Printing Duplex: 16lb to 28lb

Printing from Multipurpose Try to optional Face Up Tray: 16lb to 50lb

Printing from Multipurpose Try to Face Down Tray: 16lb to 28lb

Duplexer Paper Size Support

The duplexer supports letter, legal and A4 paper sizes. These sizes are supported by the engine and LaserWriter driver software. Any other sizes will likely cause jamming due to timeouts and handling problems.

Apple Products: Multihoming and Multinode Support

This article contains information about the implementation of multihoming and multinode support in Apple products. This is an advanced technical article provided for informational purposes only. Apple will not provide assistance with interpreting or understanding this information.

Questions answered in this article:

What is meant by the terms multihoming and multinode support?

Which Apple products include multihoming or multinode support?

How does the network connectivity for the DOS and Mac OS environments on the enhanced PCI-based Power Macintosh computers differ from previous Macintosh computers using DOS or PC Compatibility Cards?

If I have a PC Compatibility card installed in an enhanced Power Macintosh**, can I install an additional network adapter card for use in the DOS environment?

This article has been archived and is no longer updated by Apple.

Question: What is meant by the terms multihoming and multinode support?

Answer: Multihoming is the term applied to the capability to communicate using more than one network interface (card), at the same time, using the same protocol. In such a situation, the different network cards can each be connected to different zones and have different addresses, but each must be using the same protocol, such as TCP/IP, AppleTalk, and so on.

Multinode support (often referred to as Single link multi-homing), however, is the capability to communicate using multiple network protocol addresses through a single network interface (with different datalink addresses) using a single protocol.

	Network Interface Cards	**Hardware Addresses**	**Protocol Addresses**	**Protocols**
Multihoming	Multiple	Different	Different	Same
Multinode	Single	Different	Different	Same

Question: Which Apple products include multihoming or multinode support?

Answer:

Multihoming Support

Open Transport 1.1 introduced AppleTalk multihoming support to developers at the API level. This change allowed developers to re-write existing applications to take advantage of this feature.

With the release of Open Transport 1.1, AppleShare 4.2.1 incorporated AppleTalk multihoming support. With AppleShare 4.2.1, you can install multiple network interface cards into the server allowing users to connect to volumes and servers with the same name in different zones, allowing multiple network interfaces to be active simultaneously.

By supporting multiple network connections, multihoming support provides additional "pipelines" to the server, which increases the amount of network traffic that can reach the server. This enables servers to support more clients, to offer greater total performance, and to increase the reliability of mission critical applications.

Please note that multihoming does not bridge or route those network segments into a LAN. The network segments will not see each other by being connected to this one computer, but clients on the unique network segments will all see the AppleShare server.

AppleShare IP 5 and 6 also take advantage of multihoming. Note that multihoming support is still limited to AppleTalk.

The Apple Internet Router v3.0 modifies the Classic AppleTalk stack to allow multihoming. A re-write of the router is required to use the built-in AppleTalk multihoming capabilities of version 1.1 of the Open Transport/AppleTalk stack.

The ARA Client supports AppleTalk multihoming for a single limited case: two ports only--one LAN and one serial, in both Classic and Open Transport network configurations.

Multinode Support

- Open Transport 1.3 introduced single link multihoming (Multinode support), a mechanism by which Open Transport can support multiple IP

addresses on the same hardware interface. Synonyms for this feature include IP Aliasing, Secondary IP address support, IP Masquerading, "Multihoming", and IP Multinode support. This is useful for sites like Internet Service Providers (ISPs), that want to give each of their clients a distinct IP address, without requiring separate computers for each address. Web server software packages or server plug-ins that utilize this feature can offer virtual domain support that supports all web browsers.

- The ARA Personal Server uses AppleTalk multinode capability in both the Classic and Open Transport/AppleTalk protocol stacks and is compatible with both network systems.
- The ARA Multiport Server uses AppleTalk multinode capability in both the Classic and Open Transport/AppleTalk protocol stacks and is compatible with both network systems.
- The Apple IP Gateway modifies MacTCP to allow TCP/IP multinode capability using Classic networking. A re-write of the IP Gateway is required to use the TCP/IP built-in multihoming capabilities that are planned for future Open Transport releases. Open Transport 1.1 does not include TCP/IP multinode support.
- Starting with the Enhanced PCI-based Power Macintosh computers**, and later with the PowerMacintosh G3 computers, built-in Ethernet hardware allowed PC Compatible cards and the Mac OS environment to share the built-in Ethernet interface, therefore allowing simultaneous network connections in both environments. Each environment uses a separate physical layer address. Depending upon the capabilities of each protocol stack being used in a given environment, multinode support may or may not be available. For example, you can connect the DOS and Macintosh environments to the same network using the same protocol (such as TCP/IP).

This configuration could also be loosely defined as multihoming because even though the Mac OS and DOS environments use the same network controller protocols, they appear as separate hardware addresses on the network. Essentially, one physical network interface appears as two.

To further describe the full capabilities of these advanced Apple systems, the implementation of a protocol stack in the Mac OS or DOS environment may itself include multinode support. For example, the TCP/IP protocol stack installed in the DOS environment may support assigning multiple IP addresses to a physical interface using the primary hardware address. In this type of configuration, a Macintosh computer with the enhanced Ethernet controller, Open Transport 1.1 or later and a PC Compatibility Card can accept connection to three or more IP addresses.

Note: By default, Open Transport/TCP can only be configured to use one port at a time. IPNetLink, a utility from Sustainable Softworks, http://www.sustworks.com/~psichel, removes this limitation.

Tenon's MachTEN, http://www.tenon.com, and Vicom's SoftRouter and SurfDoubler products, http://www.vicomtech.com, also allow a Macintosh to use two or more ports concurrently with TCP/IP.

Question: How does the network connectivity for the DOS and Mac OS environments on the enhanced PCI-based Power Macintosh computers differ from previous Macintosh computers using DOS or PC Compatibility Cards?

Answer: In other Macintosh computers that use DOS or PC Compatibility Cards, you do not have multinode or multihoming support. Instead, you only have one effective instance of an TCP/IP protocol stack. You can be connected using either the Mac OS or DOS environment, but you cannot be connected using both environments simultaneously.

Question: If I have a PC Compatibility card installed in an enhanced Power Macintosh** or a Power Macintosh G3, can I install an additional network adapter card for use in the DOS environment?

Answer: No. The installed PC Compatibility Cards are hard-coded to use the built-in Ethernet interfaces. However, you can add an additional network card to provide additional network services, such as AppleTalk for the Mac OS. The Mac OS and DOS environments would then use the built-in Ethernet for TCP/IP, and the Mac OS could use the Ethernet card for AppleTalk.

Even though you are providing another network interface for the computer to use, you do not get any network performance advantage by doing this. However, this is a viable solution if the DOS and Mac OS environments need to be physically located on different networks.

****Note:** Following are the Enhanced Power Macintosh computers:

- Power Macintosh 7200/90 (Europe ONLY)
- Power Macintosh 7200/120
- Power Macintosh 7300 series
- Power Macintosh 7600 series
- Power Macintosh 8500/132
- Power Macintosh 8500/150
- Power Macintosh 8500/180
- Power Macintosh 8600 series
- Power Macintosh 9500/150
- Power Macintosh 9500/180MP
- Power Macintosh 9500/200
- Power Macintosh 9600 series

LaserWriter 12/640 PS: Printing two-sided letterhead paper

I am using letterhead stationary with a LaserWriter 12/640 PS printer. I have the duplexer installed, and sometimes need to print on both sides of the letterhead stationary. When I do, the letterhead ends up at the top of page 2 instead of page one. How can I get the letterhead on page one?

This article has been archived and is no longer updated by Apple.
When printing using the Duplex Printing Unit to print on both sides of the page, the printer is designed to print in the reverse order.

For example, a two page document prints page 2, then page 1. Four page documents print in the following order; page 2, page 1, page 4, then page 3.

When printing letterhead, position the paper so the letterhead is facing down and towards the back of the printer. This makes the letterhead appears on the top of the first page, instead of page two.

If you print both single-sided and double-sided documents, you can use the built-in multipurpose tray, you should use the 250-sheet cassette for single-sided paper, and the Multipurpose tray for double-sided.

Network Assistant: How to Get Software Versions

I am using the Network Assistant application which is part of the Apple Network Administrator Toolkit (ANAT), and need the software version information about one of the workstations. When I select the Software Version menu item from the Reports menu, a window reports, "This report displays version information for software installed on (name of remote workstation)". However, the window only lists the software installed on my local computer.

How do I get information about the workstation that I selected?
This article has been archived and is no longer updated by Apple.
In this window, is a Get Report button. Click on one of the software items in the list then click Get Report, and the version information from the remote workstation will be returned. The main window will only list software located on the local computer.

Cyrillic Lang Kit: Does It Follow Stnrd Keyboard Layout?

Does the phonetic transliterated keyboard layouts used by the Russian language in the Cyrillic Language kit follow the same standard set by the American Teachers of Slavic and Eastern European Language (ATSEEL) or the American Association for the Advancement of Slavic Studies (AASSS)?

This article has been archived and is no longer updated by Apple.

ATSEEL and AAASS have not yet officially agreed upon a recognized standard set of keyboard layouts. However, ATSEEL's Ad Hoc Committee on Standardization of Computer Keyboards for Cyrillic does have a suggestion for keyboard layout usage.

Apple has included as shareware on the CD, Matvey Palchuk's keyboard layout which is based on the work of ATSEEL's Ad Hoc Committee. Since, there was no agreed upon standard at the time Apple's Cyrillic Language Kit was released, it was decided that this was the most appropriate approach for Apple to take.

LaserWriter Printers: Renaming and Turning Off Startup Page

I have a PostScript Apple LaserWriter and would like to change the name that shows up in the chooser under "select a LaserWriter". Also, I would like to turn off the startup page.
This article has been archived and is no longer updated by Apple.
In order to change the LaserWriter name, your LaserWriter printer needs to be a network PostScript printer and its current name is listed in the Chooser when selecting the LaserWriter or LaserWriter GX icon. You cannot change the name of the LaserWriter Select 310, which is a PostScript printer, because it is not a networkable printer, and does not broadcast a name through AppleTalk.

To change the name of the printer you will need either a copy of LaserWriter Utility or Apple Printer Utility. These utilities are on the first disk of the printer disk set, or you can install them with the custom install feature. If you are running system 7.5.x, you can custom install either utility directly using the system 7.5 installer.

Using LaserWriter Utility To Rename a Printer

To access the printer using LaserWriter utility, you must already have your LaserWriter properly configured in the Chooser. The easiest way to determine if your printer is properly configured is to print to the printer. If you can print to the LaserWriter printer, then it is properly configured.

1. Launch the LaserWriter Utility. The LaserWriter Utility tries to make a connection to the current printer when the initial screen appears. If the connection is successful, the splash screen disappears and three menus appear in the Menu bar. If the LaserWriter Utility does not make a connection, make sure you have the proper printer selected in the Chooser, and verify that you can print to the printer.
2. Choose Name Printer from the Utilities menu.
3. Type the new name for the printer.
4. Click the Rename button.

Using LaserWriter Utility To Turn Off The Startup Page

1. Launch the LaserWriter Utility. The LaserWriter Utility tries to make a connection to the current printer when the initial screen appears. If the connection is successful, the splash screen disappears and three menus appear in the Menu bar. If the LaserWriter Utility does not make a connection, make sure you have the proper printer selected in the Chooser, and verify that you can print to the printer.
2. Choose Set Startup page from the Utilities Menu. A dialog appears allowing you to select Startup page on or off.
3. Choose if you want the Startup page on or off.
4. Click OK.

Using Apple Printer Utility (1.x)

To access the printer using Apple Printer Utility, you must already have your LaserWriter properly configured in the Chooser. The easiest way to determine if your printer is properly configured is to print to the printer. If you can print to the LaserWriter printer, then it is properly configured.

1. Launch the Apple Printer Utility. A window appears with a list of printers. This is similar to the way printers appear in the Chooser.

2. Select the printer you want to connect to.

3. Click the Open Printer button. A status window appears informing you that it is checking the status of your LaserWriter printer. After this is complete, a window with all the printer information appears. The information is subdivided into two sections, printer information and printer preferences.

4. Click the triangle next to printer preferences to set the startup page or rename the printer.

Note: Steps 5 through 7 explain how to rename a LaserWriter printer. Steps 8 through 10 explain how to change the startup page status. Continue only if you wish to perform these actions.

To rename the LaserWriter printer:

5. Click the triangle next to Name. The name of the current printer appears.

6. Type over the current name of the printer.

7. Click the Send button at the top of the window. Changes will not be made unless you click the Send button.

To change the Startup Page status:

8. Click the triangle next to Startup Page. Most printers will have a check box for Print a startup page each time the printer is turned on.

9. Click the check box to change the status. An X in the box indicates a startup page prints when the printer is powered on. The default is to generate a startup page.

10. Click the Send button at the top of the window. Changes will not be made unless you click the Send button.

Note: Some printers such as the Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS have more than one test page. You can select which pages, if any, you want to print at startup.

Using Apple Printer Utility (2.x)

To access the printer using Apple Printer Utility, you must already have your LaserWriter properly configured in the Chooser. The easiest way to determine if your printer is properly configured is to print to the printer. If you can print to the LaserWriter printer, then it is properly configured.

1. To access the printer using Apple Printer Utility, first ensure you have a working connection to the printer. Next, launch the Apple Printer Utility application. A window appears with a list of printers. This is similar to the way printers appear in the Chooser.

2. Select the printer you want to connect to.

3. Click the Open Printer button. A status window appears informing you that it is checking the status of your LaserWriter printer. After this is complete, a window with all the printer information appears. The information is subdivided by category.

Note: Steps 4 through 6 explain how to rename a LaserWriter printer. Steps 7 through 9 explain how to change the startup page status.

To rename the LaserWriter printer:

4 . Click the triangle next to Name. The name of the LaserWriter printer appears.

5. Type over the current name of the printer.

6. Click the Send button to send the new name to the printer. Changes will not be made unless you click the Send button.

To change the Startup Page status:

7. Click the triangle next to Startup Page. A check box for Print a startup page each time the printer is turned on appears.

8. Click the check box to change the status. An X in the box indicates a startup page prints when the printer is powered on. The default is to generate a startup page.

9. Click the Send button at the top of the window. Changes will not be made unless you click the Send button.

Note: Some printers such as the Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS have more than one test page. You can select which pages, if any, you want to print at startup.

Drive Setup: Common Reasons Why it Cannot Update Driver

This article describes reasons why Drive Setup options many not be available (options are dimmed) on both SCSI and IDE drives.
This article has been archived and is no longer updated by Apple.
The update driver option may be dimmed because of the following:

Insufficient disk space to install a driver
The driver cannot be placed on the drive without sufficient space in the first part of the hard drive. Once created, the size of partitions cannot be safely changed. They must be removed and recreated. This requires erasing your drive. Be sure to back up all data before erasing.

Mac OS X Disk Utility did not install Mac OS 9 drivers
If you choose not to install Mac OS 9 disk drivers when using the Mac OS X disk utility, space will not be allocated on the disk for Mac OS 9 drivers. See technical document 107285, "**Macintosh: Computer Can Start Up From Mac OS X But Not From Mac OS 9**".

The hard disk was formatted with a third-party utility
Drive Setup will not attempt to update the drivers on a device being controlled by a third party driver. A reason for this, is to not replace a security driver which may have moved vital data on the hard disk. The next time the user starts the computer, the hard disk may now be corrupted and unusable.

The installed driver is newer than the version supplied in Drive Setup
Check the version of the hard disk driver by selecting the hard disk and choosing the Get Info command in the File menu. The Info window will show the version information for the driver in the Where field. For instance, a drive formatted with Apple's Drive Setup might show:

Macintosh HD, Bus 0, SCSI ID 0, (v8.0.4)

The driver version is listed between the parentheses. If the version is newer than the version of the driver installed by Drive Setup, Drive Setup will not be able to update the driver. You do not want to place an older version of the driver on the hard disk so the update option is disabled in this circumstance.

For additional information on updating the driver see the following article:
Article 22167: "**Apple Hard Disk Driver Matrix**"

You can refer to the last two digits of the driver version number to determine whether the version of Drive Setup will have a newer driver. For example, if in the Get Info window, the driver version number is 8.0.5 and the version of Drive Setup is 1.0.4, Drive Setup will not update the driver (.0.5 is newer than .0.4).

Some PCI-based Power Macintosh computers shipped with Drive Setup 1.0.4 and with hard disks that contain SCSI driver version 8.0.5. Driver version 8.0.5 has fixes specific to the Power Macintosh 9500/200 and Workgroup Server 8550/200. The 9500/200 and Workgroup Server 8550/200 ships with a Drive Setup Updater program that will let users update their SCSI driver to version 8.0.5 after formatting with Drive Setup 1.0.4. If either the 9500/200, or 8550/200 is reformatted using Drive Setup, the driver installed will be listed, when performing a Get Info, as version 8.0.4.

The Drive Setup Updater when used to update the driver to version 8.0.5 will still be listed, in Get Info, as 8.0.4 -- the driver itself gets updated, but the version string does not. Other PCI-based Power Macintosh computers, like the Power Macintosh 7600 and 8500, may also ship with hard disks that have driver version 8.0.5. Drive Setup 1.0.4 will not update these drivers resulting in the update option being dimmed.

Do not be concerned with Drive Setup 1.0.4 not being able to update the driver on computers other than the Power Macintosh 9500/200. Due to manufacturing efficiency, the 8.0.5 version of the SCSI driver is being installed on all SCSI hard disks. If you are not using a Power Macintosh 9500/200, there is no harm in formatting the hard disk with Drive Setup 1.0.4 and having the driver revert to version 8.0.4. Also, there is no need to format a hard disk and revert to driver version 8.0.4 just because the update option in Drive Setup is dimmed.

PowerBook Password Security
If you are using a PowerBook, you need to first disable the password protection feature in the Password Security control panel. Password security prevents Drive Setup from updating the driver.

Media Not Partitioned
The first IDE drives installed in Macintosh computers were initialized with the Internal HD Format 1.x utility, and did not have partitioning information. Drives that show "Where: Macintosh HD, AT_0" in the volume's Get Info window are such drives. IDE drives partitioned with Drive Setup include partition information. This is why Apple's Internal HD Format utility does not recognize newer IDE drives. For more information search for the following articles:

- article 18360: **"Internal HD Format: Cannot See IDE Drives"**
- article 15826: **"Macintosh Desktop & PowerBook Computers: IDE Hard Drive"**

TA21731_Drive_Setup_Common_Reasons_Why_it_Cannot_Update_Driver.pdf

When a volume is selected in Drive Setup, the application looks for partition information on the hard disk. If it finds this partition information, the option to update the disk's driver is available. If this partition information is absent, you have to re-initialize the hard disk to properly format it to include this partition information in order to access the other options.

WARNING: Reformatting or re-initializing your hard drive erases all information on your disk. Make sure you have a backup of all files you may have created and any pre-installed software that came with your computer.

You are strongly encouraged to run Disk First Aid (or equivalent 3rd party utility) before updating the hard disk's driver. If the utility program cannot repair the damage, then update the driver. Updating a corrupted disk's driver could lead to data loss, so backup all data before updating the driver.

If updating the driver fails to correct the issue, then you may need to reformat the hard drive. Again, backup all data, as reformatting the hard drive will erase all data.

The latest version of Drive Setup is available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

The following computers should use the Drive Setup program:

- All computers with PowerPC or PowerPC G3/G4 microprocessors
- Macintosh LC 580 series
- Macintosh LC 630 series
- Macintosh LC 630 DOS Compatible
- Macintosh Quadra 630 series computers
- Macintosh Performa 580 series computers
- Macintosh Performa 630 and 640 series computers
- PowerBook 150 series computers
- PowerBook 190 series computers

All other computers should use Apple HD SC Setup.

NOTES:

- Drive Setup does not work with PowerPC Upgrade Cards. You can use Apple HD SC Setup to update your driver or initialize a disk, but you need to turn off the PowerPC upgrade card before using Apple HD SC Setup.
- PowerBook 150 computers do not need to update the internal hard disk driver. That driver is contained in your computer's ROM. If you try using either utility program to update the driver, nothing will happen.

When to Update Hard Disk Drivers: General Tips

When should I use the update driver function of my disk formatting software?
This article has been archived and is no longer updated by Apple.
All Macintosh hard disk drives contain a small partition containing low level drive support code that are loaded into memory at start-up time to support the functions of the hard disk.

If your hard disk does not mount on the desktop normally, updating the driver with a formatting utility, such as Drive Setup or HD Setup from Apple, may be the solution.

You are strongly encouraged to run Disk First Aid (or equivalent 3rd party utility) before updating the hard disk's driver. If the utility program cannot repair the damage, then update the driver. Updating a corrupted disk's driver could lead to data loss, so backup all data before updating the driver.

If updating the driver fails to correct the issue, then you may need to reformat the hard drive. Again, backup all data, as reformatting the hard drive will erase all data.

As a general rule, you should use the same formatting utility to update the drivers as you used to format the disk originally. If you are updating drivers with a different utility, you should backup existing data when possible and consult the vendor of the new utility to see if their new driver can safely replace the old drivers. Drives with multiple partitions could be at risk of data loss.

LaserWriter 8.x: Changing the Default Paper Size

This article explains how to set the default paper size in the Page Setup dialog box.

This article has been archived and is no longer updated by Apple.
To set the default paper size selection:

1. Choose Page Setup from the File menu.
2. Choose the desired default paper size (and any other settings).
3. Hold down the Option key while you click OK. A dialog "Save the current Page Setup settings as the default settings?" appears.
4. Click Save.

Note: If you reinstall the Mac OS or your printing software, you may need to reset the preferred default settings.

As different printers have different physical margin limits, if you created a document that was close to the margin limits that would print on one printer, that document might get cropped when printed on another. The US Letter Small, US Legal Small, and A4 Small page sizes were developed to help avoid possible Page Layout issues.

Additional Information

A drawback to these "safe" paper sizes is that you loose about 5 mm on each margin. Nevertheless, the additional printable area is rarely used and a document formatted to fit this "small" size prints the same on any printer. Those who need to print to a larger printable area can select A4 or US Letter, and make it the default for all print jobs.

Prior to the creation of US Letter Small and A4 Small, the printable area for US Letter and A4 was in fact the same as for US Letter Small and A4 Small. Some customers, however, selected US Letter or A4 in conjunction with an option "Larger Print Area" that gave them larger margins, and this size is now the same size as the present "US Letter" or "A4" sizes.

Selecting US Letter or A4 requires more printer memory for an area of margin that is rarely used when printing standard business documents. This causes slower print times as well as prevents some complex documents from printing if the printer runs out of memory. Therefore, the default is (and has always been) the smaller margin area.

Note: Paper size options are obtained from the printer's PPD. If a particular paper size is not listed in Page Setup, for instance US Letter or US Legal Small, it may not be an available option for that printer.

CD-ROM Discs: Joliet & Romeo Name Definitions

When creating compact discs using CD-R drives, you may encounter the names Joliet and Romeo. This article discusses these file naming conventions noting the implications for Apple DOS and PC Compatibility cards.
This article has been archived and is no longer updated by Apple.
After the release of Windows 95, Microsoft developed two variations of the ISO-9660 format, named Romeo and Joliet.

Joliet File-Naming Convention

When you choose Joliet, two file lists are maintained on the compact disc. The first file list is for long Windows 95 filenames (up to 64 characters). The second file list is for DOS-compatible filenames that are truncated from the Windows 95 filenames. The way this works for the second file list is that the first six or seven letters of each long filename are used, with the tilde(~) added at the end. A unique number appears after the tilde to prevent duplicate filenames.

Romeo File-Naming Convention

The Romeo file naming convention is used only on Windows 95 or Windows NT computers. Do not use Romeo if you want to read the compact disc on operating systems other than Windows 95 or Windows NT. When you choose Romeo file naming convention during the writing of a CD session, only one file list is maintained on each CD. The Romeo file naming convention uses long Windows filenames (up to 128 characters).

Romeo Format Compatibility

The Romeo format is not currently compatible with the PC and DOS Compatibility Cards. Most Joliet formatted CD-ROM discs are compatible provided the programs used recognize the second short-name file list that was created.

PC Compatibility Cards and CD-ROM Disc Support

ISO-9660 Only: Apple PC Compatibility cards were designed to support only the ISO-9660 CD-ROM format. Whether a particular driver is 16-bit or 32-bit is irrelevant.

No Apple Update for Romeo and Joliet: There will probably not be an Apple update for Romeo compatibility or for Joliet CD-ROM discs that do not function correctly. If Romeo and Joliet were incorporated into an ISO standard, then it is possible that a Mac OS CD-ROM driver could allow these discs to work. Microsoft would have to submit these as standards, they would have to be accepted, and then a CD-ROM driver vendor (or Apple) would need to update their software to accommodate the new standard.

Real Mode (16-bit) versus Protected Mode (32-bit): The PC Compatibility cards all access the drives (floppy, CD-ROM, and hard drive) in Real or DOS Compatibility Mode. There are some programs (usually programs that are Windows 95-only) that require Protected Mode drivers. Unless these programs have a Real Mode compatible version, they will not work with the PC Compatibility cards. Apple has no plans at this time for Protected Mode drivers for the PC Compatibility cards.

Using Incompatible CD-ROM discs: For CD-ROM discs that are neither Romeo or Joliet or ISO-9660, you may be able to set them up as shared drive in PC Setup. An example of this would be a CD-ROM disc recorded as a High Sierra format disc (the precursor to ISO-9660). Mac OS can read this format. Anything that Mac OS can read should be able to be mounted as a shared disc.

Iomega Zip Drive: Purpose of Iomega Guest Application

This article describes the Iomega Guest application included with Iomega Zip drives.
This article has been archived and is no longer updated by Apple.
Iomega Guest is a utility that allows you to temporarily use a Zip drive on a Macintosh computer without having to install the Iomega Driver in the System Folder. Running Iomega Guest provides the same access to your Zip drive as having the Iomega Driver permanently installed as an extension--it allows you to read files from a Zip disk, write files to a Zip disk, and run the Tools or other software from your Zip disks. The only difference is that when using the Guest program to provide access to your Zip drive, the Iomega Driver does not load automatically each time you start or restart the Macintosh.

Why use Iomega Guest?

There are many reasons to use Iomega Guest:

* If you want to use a portable Zip drive on multiple computers, but you do not want to install the full Iomega software package.

* If you want to start your Macintosh computer with the extensions disabled, but you still want access to you Zip drive. This is particularly useful when troubleshooting.

* If you do not want to install the Iomega Driver permanently in order to reduce the chances of extension conflicts.

How to use Iomega Guest

* To use the Guest program on you own computer, for instance if you have installed Iomega software but are starting your computer with the extensions disabled, simply open the Iomega Tools folder and double-click the Guest icon.

NOTE: You must have the drive connected to the computer before running Guest. Also, the Iomega driver is not installed permanently on a Macintosh computer using this connection method.

Alternative to loading Iomega Guest

An alternative to loading Guest is to simply to have a Macintosh formatted Zip disk inserted when you start your computer. Macintosh-formatted Zip disks contain a driver which will automatically run when the computer starts. To use this simply alternative:

1. Insert a Macintosh formatted Zip disk into the Zip drive.
2. Start the computer following your normal startup procedures.
3. Once your Macintosh has started with the Zip disk inserted, you will be able to use your drive just like any other removeable drive on your system.

NOTE: The Iomega driver is not installed permanently on a Macintosh using this connection method.

Troubleshooting

* The following message may appear when you are attempting to run the Iomega Guest utility, "
The driver version 5.0.1 is loaded and ready to run your drive(s)." This message generally indicates that the Iomega Driver is already loaded. Since the Iomega Driver is already loaded, you do not need to use the Iomege Guest utility. In this case, you need only to close the message dialog box and access the Zip drive.

Note: This information comes directly from the online Iomega Guest Help manual, which was included with your Macintosh computer.

Iomega Zip Drive: Tools FAQ

This article contains frequently asked questions about using the Tools application included with Iomega Zip drives on some Macintosh computers.

Questions in this FAQ

1) How can I change a PC-formatted Zip disk to Macintosh format?

2) How can I change the password on a protected Zip disk?

3) How can I change the Zip drive sleep time?

4) How can I password protect a Zip disk?

5) How can I read/write protect a Zip disk?

6) How can I repair a Zip disk?

7) How can I unprotect a protected Zip disk?

8) How can I write protect a Zip disk?

9) What does Disk Protection do for me?

10) If I use Disk Protection, can someone else bypass it and access files on my Zip disk?

11) What is the difference between Erase and Erase with Surface Verify?

12) What happens if I forget my password for a Zip disk?

This article has been archived and is no longer updated by Apple.

1) Question: How can I change a PC-formatted Zip disk to Macintosh format?

Answer: You can change a PC-formatted Zip disk to a Macintosh format by erasing the disk. If you are not using PC Exchange, you can use Erase Disk from either the Finder or the Tools application to change the disk format.

NOTE: If you are using PC Exchange, you must use Erase or Initialize Disk in the Tools application program to change the disk format. PC Exchange will not allow the format to be changed when using the Finder.

If you need to change a Macintosh-formatted Zip disk to a PC format, use the Tools program on a PC to reformat the disk.

2) Question: How can I change the password on a protected Zip disk?

Answer: To change the password on a protected Zip disk you must know the current password. Then, follow the steps below.

1. Insert the disk for which you want to change the password.
2. Click on the disk icon in the main Tools window.
3. Click on the Change Disk Protection tool.
4. Select Change Password from the Disk Protection Options window.
5. Enter the current disk password, and then enter the new password you want to use.
6. When prompted, retype the new password to confirm it.
7. Close the Disk Protection Options window.

NOTE: You must close any open files and quit all applications running from a disk before you can change its password. If the disk is being shared, you must first turn off sharing. After you have changed the password, you can turn sharing back on.

3) Question: How can I change the drive sleep time?

Answer: There are two ways to change your drive sleep time:

Iomega Drive Options Control Panel

1. Open the Control Panel folder and double-click Iomega Drive Options.

2. Select the drive on which you want to change the drive sleep time.
3. Using the up and down arrows, change the Drive Sleep Time to your desired length of time. You can change the period of inactivity before drive sleep occurs from a minimum of 1 minute to a maximum of 60 minutes.
4. Press Save to implement the changes you have made.

Note: If you do not want to save the changes, choose Don't Save instead.

Tools Menu

1. Select the disk icon in the main Tools window for the drive where you want to change the drive sleep time.
2. Click on the Set Drive Options tool.
3. You will see the current sleep time setting for the selected drive in the drive options window.
4. Use the slide bar to set the sleep time you desire to use, then click on the Set button at the bottom of the Drive Options window.

4) Question: How can I password protect a Zip disk?

Answer: The Tools application provides two options for protecting your Zip disks: Write protection and Read/Write protection.

If you wish, you can use a password when you write-protect a disk. When you do this, no one can write files to the disk or change files on the disk without first using the password you have assigned.

When you read/write protect a disk, you must assign a password. In this case, no one can access any information on the disk without first using the password. This means that if you forget the password, there is no way to recover the information on the disk.

NOTE: You must close any open files and quit all applications running from a disk before you can protect it. If the disk is being shared, you must first turn off sharing. After you have protected the disk, you can turn sharing back on.

Follow these steps to assign password protection to a disk:

1 - Insert the disk you want to protect with a password.
2 - Click on the disk icon in the main Tools window.
3 - Click on the Change Disk Protection tool.
4 - Select the type of protection you want to use (either Write Protection or Read/Write Protection) from the Disk Protection Options window.

CAUTION! If you forget the password for a Read/Write protected disk, the data on the disk cannot be recovered (even by Iomega!).

5 - Follow the prompts to assign the password you want to use.

5) Question: How can I read/write protect a Zip disk?

Answer: You can use Tools to read/write protect a Zip disk. When you do this, you must assign a password that will be required before anyone can access any information on the disk. Take care to use a password you will not forget. If you forget the password, there is no way to recover the information on the disk. In order to use the disk at all, you will have to reformat it, which will destroy all files on the disk.

NOTE: You must close any open files and quit all applications running from a disk before you can read/write protect it. If the disk is being shared, you must first turn off sharing. After you have protected the disk, you can turn sharing back on.

Follow these steps to read/write protect a Zip disk:

1. Insert the disk you want to protect.
2. Click on the disk icon in the main Tools window.
3. Click on the Change Disk Protection tool.
4. Select Read/Write Protection from the Disk Protection Options window.
5. Follow the prompts to assign the password you want to use.

CAUTION! If you forget the password for a Read/Write protected disk, the data on the disk cannot be recovered. Because the actual disk protection mechanism is secured in the drive hardware and is not software-based, it cannot be bypassed using other software programs.

6) Question: How can I repair a Zip disk?

Answer: If a Zip disk begins to develop read/write errors, it is probably due to bad sectors on the disk. You can use Erase Disk with Surface

Verify in the Tools application to repair a disk that has developed read/write errors due to bad sectors. However, this will erase all data on the disk. To save the information on the disk, copy all files to another disk before you repair the disk.

Follow these steps to repair a disk that has developed read/write errors:

1. Copy all information on the disk you need to repair to another disk.
2. Insert the disk you want to repair.
3. Open the Tools application.
4. Click on the disk icon in the main Tools window.
5. Click on the Erase Disk tool.
6. Select the Erase Disk with Surface Verify option.

CAUTION: All of the information on a disk is lost when a disk is erased. Make sure that any information you may need has been copied before you erase the disk.

7) Question: How can I unprotect a protected Zip disk?

Answer: Tools offers two options for unprotecting a protected Zip disk: Temporarily Unprotect and Remove Protection. Note that if the disk is protected with a password, you must use the password in order to use either unprotect option.

* Temporarily Unprotect gives you temporary access to a protected disk. When you temporarily unprotect a write-protected disk, it will be automatically write-protected again when ejected. If you temporarily unprotect a read/write-protected disk, you must restart your Mac to restore protection.

* Remove Protection completely removes either write protection or read/write protection.

NOTE: You must close any open files and quit all applications running from a disk before you can unprotect it. If the disk is being shared, you must first turn off sharing. After you have unprotected the disk, you can turn sharing back on.

Follow these steps to unprotect a protected disk:

1 - Insert the disk you want to unprotect.
2 - Click on the disk icon in the main Tools window.
3 - Click on the Change Disk Protection tool.
4 - Select the unprotect option you want to use (either Temporarily Unprotect or Remove Protection) from the Disk Protection Options window.

CAUTION: If you temporarily unprotect a read/write-protected disk, you must restart your Mac to restore protection.

5 - If prompted for a password, enter the current password for the disk.

8) Question: How can I write protect a Zip disk?

Answer: Iomega Zip disks can be write protected using the Tools application instead of a mechanical write-protect switch. Write protection means anyone can read or copy files from the disk, but no one can write files to the disk or change files on the disk without first removing the write protection. If you wish, you can assign a password that must be used in order to remove the write protection. (This is a great way to make sure your kids cannot accidentally overwrite your important information.

NOTE: You must close any open files and quit all applications running from a disk before you can protect it. If the disk is being shared, you must first turn off sharing. After you have protected the disk, you can turn sharing back on.

Follow these steps to assign write protect a Zip disk:

1. Insert the disk you want to protect.
2. Click on the disk icon in the main Tools window.
3. Click on the Change Disk Protection tool.
4. Select Write Protection from the Disk Protection Options window.
5. If desired, select the password option and follow the prompts to assign the password you want to use.

9) Question: What does Disk Protection do for me?

Answer: This tool increases your Zip disk protection options beyond the functionality provided by a conventional write-protect tab. Disk Protection allows you to set write protection that acts just like that from a physical write-protect tab or switch, but it also allows you the option of assigning a password that must be used to remove the write protection. Or you can set read/write protection to make highly sensitive data

completely unreadable by anyone who doesn't know the password you assign. Other options allow you to temporarily unprotect a disk or remove protection completely if desired.

10) Question: If I use Disk Protection, can someone else bypass it and access files on my Zip disk?

Answer: If you set either read/write protection or write protection with a password, no one can remove the protection without using the correct password. Because the actual disk protection mechanism is secured in the drive hardware and is not software-based, it cannot be bypassed using other software programs.

11) Question: What is the difference between Erase and Erase with Surface Verify?

Answer: Erase in Tools works just like Erase from the Finder. Choosing this option quickly erases the header information on a disk, allowing the rest of the data on the disk to be overwritten with new data as you work. Erase with Surface Verify is a longer format that erases the entire disk and verifies the integrity of the entire disk surface. If a disk develops read/write problems, use Erase with Surface Verify to repair it. (CAUTION: All information on a disk is lost when the disk is erased, so make sure you copy any information you need before erasing the disk.)

12) Question: What happens if I forget my password for a Zip disk?

Answer: If you forget the password for a write-protected disk, you can use the Finder to copy the data on that disk to another disk, then use Erase with Surface Verify to erase and reclaim the protected disk. If you forget the password for a disk that is read/write-protected, the data on the disk cannot be recovered in any way. In order to use the disk again, it must be reformatted using Erase Disk with Surface Verify, and all data on the disk will be lost.

Iomega Zip Drive: Troubleshooting FAQ

This article contains frequently asked questions about troubleshooting Iomega Zip drives and disks, with answers to those questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Why does the Iomega driver appear crossed-out at system startup time?
2. Why doesn't the Zip disk icon appear on the desktop?
3. Why does a disk with flashing "?" appear at system startup time?
4. Why would the startup process fail after the Iomega driver is loaded?
5. How can I test for possible conflicts with my Zip drive?
6. Why is my Zip disk ejected immediately when inserted?
7. What would cause a Zip disk to fail to erase or format?
8. Why won't the Zip disk eject when the disk icon is dragged to the Trash?
9. What would cause the Zip drive to have intermittent read/write errors?
10. When I attempt to use the iomega Tools applications an error message appears stating that "... Tools cannot load/run..." What is causing this?
11. What does the light on the front of the Zip drive opening indicate?
12. How can I verify that my Zip drive is properly connected?
13. Zip disks do not appear on the desktop or eject, and the green status light is flashing. What can I do to remedy this?
14. Writing to a Zip 100 disk in my Zip 250 drive seems very slow. Is this normal?

Question 1: Why does the Iomega driver appear crossed-out at system startup time?

Answer: After the Iomega Driver is installed on the computer's startup disk, it normally loads at system startup time. If the driver is installed in the startup disk's Extensions folder, but is unable to load successfully, a red X appears over the Iomega driver extension at system startup time.

If the Iomega driver does not load at system startup time, but you are still able to access your Zip drive, a non-Iomega driver may be loading before the Iomega driver and taking over control of the Zip drive.

To identify the driver that is controlling the Zip drive, select a Zip disk icon in the Finder, then choose Get Info from the File menu. The driver appears in parentheses at the end of the line titled Where.

If a non-Iomega driver is controlling the Zip drive, try the following steps to eliminate the conflict:

- Make sure no disks other than the startup disk are inserted when you turn on the computer. A disk formatted using a non-Iomega driver could be loading that driver onto the system.
- Try renaming the Iomega driver so that it loads earlier. (These types of files are loaded in alphabetical order.)

If you intend to use a non-Iomega driver to control the Zip drive, you should remove the 5.0.1 Iomega driver from the system.

Note: Non-Iomega drivers may not provide full functionality for the Zip drive. (For example, a non-Iomega driver may not support Zip disk protection.)

Question 2: Why doesn't the Zip disk icon appear on the desktop?

Answer: One of the following suggestions should solve this:

- Shut down the entire system (the computer and everything connected to it). Restart the system, making sure the computer is the last device turned on.
- Open the Iomega Guest program.
- Make sure a Zip disk is fully inserted in the drive. A Zip disk icon can only appear on the Desktop when a disk is inserted.
- If the Iomega driver is installed on your startup disk, make sure it is loading successfully. If the driver is correctly installed but does not load at system startup time, follow the steps in question 1.
- A non-Iomega driver may be trying to control the Zip drive. Follow the steps in question 1.

Question 3: Why does a disk with flashing "?" appear at system startup time?

Answer: This indicates that the computer cannot find a startup disk and is often due to a hardware issue. Try the following:

If you are using a Zip disk as the startup disk, make sure it is fully inserted in the drive before turning on the computer, and that you hold down the Option key at system startup time. Also make sure there are no disks in the computer's floppy disk drive.

If this does not resolve the situation, test the computer by disconnecting all external SCSI devices and restarting from the hard drive or from the CD-ROM disc that came with the computer.

Question 4: Why would the startup process fail after the Iomega driver is loaded?

Answer: This can be caused by hardware conflicts or by conflicts with non-Apple or third-party control panels or system extensions.

- If you identify a conflicting system extension, remove it from the system.
- Make sure the Iomega driver is correctly installed on your startup disk.

If you cannot identify a conflicting system extension and the driver is correctly installed on your startup disk, test for a source of conflict by following the steps in question 5.

Question 5: How can I test for possible conflicts with my Zip drive?

Answer: Use the following steps to determine the source of a conflict that prevents successful startup:

1. Turn off system extensions by pressing and holding down the Shift key while the computer starts up. (You should see the note "Extensions off" or "extensions disabled" if not, repeat step 1.)

2. Load the Iomega driver manually by double-clicking on the Iomega Guest utility. If the Guest program installs the driver successfully, it suggests that there is a conflict with a non-Apple control panel or extension.

If you encounter conflicts between the Iomega driver and non-Apple control panels or system extensions, you must first try to identify the control panel or extension that is causing the conflict and then remove it from the system.

Question 6: Why is my Zip disk ejected immediately when inserted?

Answer: There are two likely possibilities:

A Zip disk may be immediately ejected if the format on the disk is bad and PC Exchange is running on the Macintosh computer. You may or may not see a dialog box indicating that disk initialization failed. If you can see the dialog box, click on the default button. If you cannot see the dialog box, just press the Return key and your system returns to normal. To fix the format on the Zip disk, first turn off the PC Exchange control panel. Then reformat the disk using Erase Disk with Surface Verify in the Tools program. You can also perform an Erase Disk with Surface Verify from the Finder by holding down the Option key when you start the format. Make sure you hold down the Option key until the format begins.

A Zip disk may be immediately ejected if the capacity of the disk being inserted is higher than the drive can support. For example, if your computer is equipped with a 100 MB Zip drive, the highest capacity Zip disk it would be able to read is 100 MB. If you insert a 250 MB Zip disk, the Zip drive would eject it because it is unable to read it. Internal Zip drives that come with Macintosh computers (as of 1999-10) are 100 MB drives.

Question 7: What would cause a Zip disk to fail to erase or format?

Answer: Difficulties with formatting Zip disks are usually due to a conflict caused by a non-Apple control panel or system extension.

If you cannot identify or resolve the conflict, try turning off system extensions while formatting Zip disks, and follow these steps:

1. Hold down the Shift key and restart your computer. Make sure you hold down the Shift key until you see the message saying extensions are disabled or off.

2. Open Iomega Guest to load the Iomega driver.

3. Openb the Iomega Tools program.

4. Insert a Zip disk and click the Erase or Initialize Disk button. Select the options you want to use and click OK.

If this procedure works, you should use it whenever you erase or format Zip disks. If the disk still does not format, try formatting a different disk. If you are able to format the second disk, it indicates that the first disk may be bad.

Question 8: Why won't the Zip disk eject when the disk icon is dragged to the Trash?

Answer: Try the following suggestions:

- If the disk icon is still on the desktop, drag it to the Trash again.
- Try restarting the computer. The disk may lock in the drive if the system has stopped responding or "crashed."

Question 9: What would cause the Zip drive to have intermittent read/write errors?

Answer: If read/write errors occur only with a specific Zip disk, reformat the disk using Erase Disk with Surface Verify.

Question 10: When I attempt to use the iomega Tools applications an error message appears stating that "... Tools cannot load/run..." What is causing this?

Answer: The Tools program is unable to run if:

- you try to run Tools and the Iomega driver is not loaded on the system.
- you try to run a version of Tools different from the version of the driver currently loaded on the system.
- you try to run Tools and the Iomega driver is unable to find any supported Zip drives.

Question 11: What does the light on the front of the Zip drive opening indicate?

Answer: The light provides information that may be helpful when troubleshooting.

After inserting a Zip disk, look for an amber light in the lower right corner of the Zip drive opening. There should be some initial blinking, but after the disk has become available on the desktop, the light should not blink. If the light continues to blink, it could suggest:

Slow blinking amber light

- check installation of software
- check SCSI connection of hardware
- hardware malfunction (communication)

Fast blinking amber light

- check Zip disk for mis-alignment
- check Zip disk for damage
- hardware malfunction (media detection)

Question 12: How can I verify that my Zip drive is properly connected?

Answer: Here is a procedure to verify that the Zip drive is properly connected and getting power:

1. Shut down the computer.
2. Disconnect all external SCSI devices from the computer.
3. Start up from the CD-ROM disc that came with your computer. (Hold down the 'c' key on the keyboard to start up from the disc)
4. Once the system has started up, open the Drive Setup application.
5. After scanning the SCSI bus, Drive Setup should list the hard drive, the CD-ROM drive and the Zip drive. The Zip drive should be listed as "<not supported>" at SCSI ID 5.

Question 13: Zip disks do not appear on the desktop or eject, and the green status light is flashing. What can I do to remedy this?

Answer:

Try the following:

1. Choose Shut Down from the Special menu.
2. Reset the Parameter RAM (PRAM) described in article 2238: "**Macintosh: How to Reset PRAM and NVRAM**".
3. After resetting the PRAM, use the Startup Disk control panel to reselect your startup disk.
4. You should now see the Zip disk on the desktop, and you should be able to eject it.
5. If the situation persists, try the suggestions listed in the answer to Question 2.

Question 14: Writing to a Zip 100 disk in my Zip 250 drive seems very slow. Is this normal?

Answer: According to Iomega technical document #30146 "**Why does my Zip® 250 drive slow down when I write large files to a 100MB Zip disk?**" this is normal. See the Iomega document for complete details.

LaserWriter 12/640 PS: Configuring TCP/IP for Text or PCL

I am trying to print a PCL file to my LaserWriter 12/640 PS printer from my UNIX workstation. Every time I try, it does not print the file correctly. I can print PostScript files correctly. Why?
This article has been archived and is no longer updated by Apple.
When Apple Computer shipped the LaserWriter 12/640 PS printer, the TCP/IP port interpreter was set for PostScript only. You need to change this to either PCL or Autoselect.

Determining TCP/IP Configuration

1. Print a startup page.
2. Look at the upper right corner for the TCP/IP field.

The TCP/IP field has the interpreter's setting.

Changing the TCP/IP Configuration

If the LaserWriter 12/640 PS printer has either a Mac OS or Windows computer attached, you can use the Apple Printer Utility (Mac OS), or LaserWriter Utility for Windows software to change the interpreter to either Autoselect or PCL.

If you do not have a Mac OS or Windows computer connected to the LaserWriter 12/640 PS, follow these steps to set the printer to autoselect:

1) Configure your UNIX workstation to print PostScript as described in its manual.

2) Ensure the LaserWriter 12/640 PS communication switch is depressed (this is the normal setting).

3) Change the setting using PostScript. Below is PostScipt code to the printer to change the settings.

```
%=============================================================
% Begin PostScript code
%
%!PS
(%LPR_NV%) <</Interpreter /AutoSelect >> setdevparams
%
% End PostScript code
%=============================================================
```

4) Restart the printer.

Resetting the LaserWriter 12/640 PS to PostScript Only

To reset the printer to PostScript only, follow these steps:

1. Press and hold the communications switch, so it is in the up position.
2. Restart the printer.
3. Release the communications switch.

The LaserWriter 12/640 PS TCP/IP port is now set to PostScript.

Macintosh Infrared: Is It IrDA Compatible?

Does the built-in infrared technology used in the PowerBook 190, 1400, 2400, 3400, 5300, PowerBook G3 and G3 Series, PowerBook (FireWire), PowerBook G4, and iMac support the IrDA (Infrared Data Association) standard? If so, can I use them to communicate with my Newton MessagePad or other IrDA device?
This article has been archived and is no longer updated by Apple.

PowerBook 190, 5300, and 1400

The PowerBook 190, 5300, and 1400 series computers are not IrDA-compliant. Hence, these computers will not work with third-party devices which are IrDA compliant, such as some of Apple's MessagePad devices and some Hewlett Packard printers. Instead, these products use a protocol named IRTalk.

The infrared implementation used in these PowerBook computers is designed to share information with other infrared-equipped PowerBook computers and the Farallon Air Dock (a wireless LocalTalk file sharing solution). The Apple IR File Exchange transfer rate is 230.4kbs, the same as LocalTalk.

PowerBook 3400, PB 2400, and PowerBook G3 and G3 Series

The PowerBook 2400, 3400, G3 and G3 Series computers are IrDA compliant. Additionally, they have the option to switch to the IRTalk protocol via the Infrared Control Panel. These computers can communicate with other IRTalk-capable devices (such as other PowerBook computers), using either the IrDA or IRTalk protocol.

Note: PowerBook G3 Series computers support IrDA 1.1 with speeds up to 4 Mbps.

While the PowerBook 2400, 3400, G3 and G3 Series computers have the hardware necessary to communicate with other IrDA compliant devices such as the Apple eMate 300 or the Newton MessagePad 2000, at this time Apple does not have a software solution to communicate with them.

For information about whether the 2400, 3400, G3 and G3 Series computers can communicate with other IrDA compliant devices, contact the manufacturer of the device.

iMac

There are several versions of the iMac computer. The first two versions (referred to as revision A and revision B) were colored Bondi Blue. The next version (referred to as revision C) was introduced in January 1999 and came in five different colors.

Revision A and B iMac computers support IrDA, but not IRTalk. Revision C iMac computers do not support infrared communication of any type.

For additional information see the following articles:

- Article 30707: "**Macintosh: Printing to a PostScript Printer via IrDA**"
- Article 30861: "**PowerBook: Printing to an IrDA Printer**"
- Article 58012: "**iMac: Infrared Communications**"

For general information on IrDA, see **http://www.irda.org**

PowerBook G3 Series (Bronze Keyboard)

PowerBook G3 Series computers are IrDA compliant. This is the first PowerBook model which does not support IrTalk. Any older PowerBook model, which can only communicate with IrTalk, will not be able to connect to the PowerBook G3 Series (Bronze Keyboard) models.

Note: See PowerBook 3400, PB 2400, and PowerBook G3 and G3 Series information listed above.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

PowerBook (FireWire)
The PowerBook (FireWire) supports IrDA.

PowerBook G4 and PowerBook G4 (Gigabit Ethernet)
The PowerBook G4 and PowerBook G4 (Gigabit Ethernet) support IrDA.

LaserWriter 12/640 PS: Legal-Sized Pages Printing Issues

Questions

1. We have a LaserWriter 12/640 PS and are unable to select the face-up output tray when we print Legal-sized pages. When I attempt to select the Face-Up tray in the Print dialog, it is dimmed. We have tried various versions of LaserWriter 8 printer driver including the latest v8.4.2, and have also tried this with and without a duplexer. Is this a supported feature with Legal-sized pages?
2. I want to feed thick Letter stock through the 12/640's straight-through paper path and am using the multipurpose tray (set for Letter) as the input tray, and the face-up tray as output. When the 250-sheet cassette is set for Legal-sized paper, output is always directed to the face-down tray instead.

This article has been archived and is no longer updated by Apple.

Answers

1. The LaserWriter 12/640 PS User's Guide on page 184 "Selecting the output tray" states: "You cannot direct the output to face-up when duplex printing. You cannot direct U.S. legal-size paper to the face-up output." The face-up tray cannot accommodate a legal-sized page. Because of this, it was decided that limiting the face-up tray for use with legal-sized pages would be a more elegant solution than having the paper fall off the tray.

2. We have verified this problem with the LW 12/640, and have reported it to engineering, however there is an easy workaround (see below).

Workaround

Temporarily adjust the 250-sheet cassette for Letter size and your print jobs will now exit on the face-up tray if you specify it as the output tray.

The Hindi Learning Stack: Read Me

This article contains the Read Me file for the Hindi Learning Stack v1.0, which is included with the Indian Language Kit. This document provides information for installing and using the Hindi Learning Stack.
This article has been archived and is no longer updated by Apple.

What is the Hindi Learning Stack?
The Hindi Learning Stack 1.0 is a Hypercard application. It helps to teach the Hindi alphabet, especially to children. It also contains three games aimed at testing alphabet recognition skills.

The Hindi Learning Stack 1.0 contents
the Hindi Learning Stack 1.0 consists of the following files:
- Hindi Learning Stack 1.0
- Hindi Learning Stack
- Gaayab!!
- Hindi Learning Stack 1.0 Read Me

System Requirements
The Hindi Learning Stack 1.0 requires
- Macintosh Computer (Power Macintosh or 68K system)
- System 7.5 or better
- Color or gray scale monitor capable of atleast 256 colors / grays
- Display resolution of 640 by 480 pixels or better
- At least 6.5 MB of available RAM

Installing the Hindi Learning Stack
To install the Hindi Learning Stack, drag the the Hindi Learning Stack 1.0 folder from Indian Language Kit CD on to your hard disk.

Running the Hindi Learning Stack
Open the Hindi Learning Stack 1.0 folder and double-click on the Hindi Learning Stack 1.0 icon. A poem and background music will play while a welcome screen is being displayed. Click on the Hindi Learning Stack screen to continue. You will see the parrot (Sonu) and the girl (Monu) flying across the screen. Sonu and Monu will lead you to the first alphabet card.

Using the Hindi Learning Stack
The Hindi Learning Stack has two sections - Alphabet Teacher and the Games.

Alphabet Teacher
Alphabet teacher takes you through a series of alphabetical cards and teaches you the Hindi alphabet.

Each alphabet card has the following buttons at the bottom:
1. Left button - Goes to the previous alphabet card.
2. Music button - Toggles the background music on or off.
3. Help button - Gives a brief description of all buttons.
4. Games button - Plays Hindi Learning Stack games.
5. Main menu - Shows the main menu of all letters in the alphabet. Click on any letter to go directly to that particular alphabet card.
6. Right button - Goes to the next alphabet card.

Each alphabet card teaches two or three related alphabets. It includes the letter itself, simple words beginning with the alphabet and pictures of familiar objects. When you come into any alphabet card, Sonu will pronounce the letters of that card for you. Repeat the pronunciation by clicking on the letter or the word again. Try clicking on the picture objects or on Monu.

Hindi Learning Stack Games
The Hindi Learning Stack includes the following three games
1. Talking Tree Game (Batooni Paed)
2. Card game (Bataon to Jaane)
3. Find the missing alphabet game (Gaayab))

- Talking Tree game: You can play this game at three levels. The first level is simple. It displays a tree with 5 letters. You will be asked to click on a particular letter. Click on the letter that Sonu asks you to select. You receive 2 points for every correct answer, reflected in your final score. Levels 2 and 3 will display a tree with 10 letters. Be careful in level 3! You will lose 2 points for every wrong guess. Sonu will repeat the letter to be selected when you click on the repeat button. If you find it difficult to pick the right letter, click on the clue button and the Hindi Learning Stack will flash the alphabet card with the correct letter.

- Flashcards game: The Hindi Learning Stack will display 3 pictures for you. You will be asked to identify the picture for the letter or word displayed. You get 2 points for every correct guess.

- Find The Missing Letter game: The Hindi Learning Stack will display a sequence of letters, with one letter missing. Sonu will also give you five likely answers. You are expected to identify the missing letter.

After completing one round, the Hindi Learning Stack will start a new round for you. You may also click on the right arrow at any time to discard the current round and start a new round.

To finish using the Hindi Learning Stack application, click on the door icon in main menu or press <Command> + Q keys.

Devanagari Typing Shikshak: Read Me

This article contains the Read Me file for the Devanagari Typing Tutor, which is included with the Indian Language Kit.
This article has been archived and is no longer updated by Apple.

Installation

To install, drag the file Devanagari Typing Shikshak on to your hard disk. Make sure that the Indian Language Kit is installed prior to launching the tutor.

Minimal System Requirements

* Macintosh Computer (PowerPC or 68K)
* Indian Language Kit 1.0
* Monitor capable of 640 x 480 pixels or better

Features

The Shikshak teaches you to type using the Inscript keyboard (default keyboard layout for Indian languages).

The Shikshak organizes lessons in "practice sessions" and "drills." Before you begin a lesson, read the introduction which describes the keys, their location and the fingers you need to use to type them. The Shikshak shows a preview of the key to be typed. The key is shown highlighted. If the key to be typed is a shifted one, shift is also highlighted.

Once you have completed practicing keystrokes, you will be shown words to type, formed with the keys you have learned. The Shikshak beeps when an incorrect key is entered.

Once the drill is complete, a dialog box showing the accuracy and speed during the lesson is displayed.

Use the "View" menu option to navigate between the lessons. The "Next" and "Prev" menu items take you to the next or previous lesson from the current one. The "Go To..." menu item allows you direct access to any lesson of Shikshak.

Use the navigation buttons, "Next Lesson" and "Prev Lesson" (same as Next and Prev menu option), to go to the next or previous lesson from the current one. The "Start Drill" button ends the practice and starts the drill. Choose "Restart Drill" to start the drill again.

The keyboard shown in the Shikshak depicts the Apple Extended keyboard. Some keys are positioned differently on various Apple keyboards. One such key is the backslash (\\) key, positioned above the return key in the Extended keyboard. It is situated to the right of the space bar on Apple standard keyboards.

The Inscript keyboard provides various conjuncts on the shifted number row of the keyboard. The conjuncts are covered in the lessons which teach the required keys. These conjuncts can be typed using the individual letters which make them or using the shifted number key directly.

Extensions Compatibility

The Typing Shikshak has known incompatibilities with the Aaron extension. The most prominent is the disappearing of text in the drills. This incompatibility is not consistent.

Keys not covered by the Shikshak

Some keys of the Inscript keyboard have not been covered in this Shikshak. These keys are used in southern scripts or are not used very often in Devanagari. These letters, as per their ISCII reference are:

Vowel Sign O (southern scripts)
Vowel Sign AWE (Devanagari script)
Vowel Sign E (southern scripts)
Vowel O (southern scripts)
Vowel AYE (Devanagari script)
Vowel Sign AYE (Devanagari script)
Vowel RI
Consonant NGA
Vowel AWE (Devanagari script)
Consonant Hard Ra (southern script)
Vowel E (southern script)
Consonant NA (Tamil)
Consonant ZHA (Tamil & Malayalam)
Consonant Hard LA
Consonant JYA (Bengali, Assamese & Oriya)

Indian Language Kit: Which Scripts & Languages Supported?

This article discusses the scripts and languages supported by the Indian Language Kit.
This article has been archived and is no longer updated by Apple.
The different languages on your computer are supported by software known as the script system. A script system makes a character set available for a particular language, tells your computer which characters to display when you type, specifies the direction of text flow, and provides other information such as sort order, date, time, number, and currency formats. If you are working in English on your computer, your system uses the Roman script.

If you are working in an Indian language, your system uses one of the Indian scripts provided by this kit. The script system generates the complex combinations of characters used in Indian languages in response to different sequences of keystrokes.

The Indian Language Kit supports several North Indian scripts. These scripts have letters representing consonants and vowel sounds. Many North Indian scripts depict words with a bar above all of the letters in the word. Also, when two consonants are joined together, a composite letter--a consonant conjunct--is formed. So, although there are a relatively small number of letters, there may be many more consonant conjuncts for a particular script.

The Indian Language Kit supports three North Indian scripts. Devanagari, Gurmukhi, and Gujarati. The same script can be used by several languages if they share most of the same characters and behaviors. For example, Devanagari is used for four languages: Hindi, Marathi, Nepali, and Sanskrit. Gurmukhi for the Punjabi language; and Gujarati for the Gujarati language. So, the Indian Language Kit supports three different scripts and six different Indic languages.
Published Date: Feb 20, 2012

Indian Language Kit: Using Different Keyboard Layouts

I installed the complete version of the Indian Language Kit, but I am not sure which keyboard layout I should use. What is the differences among the several different layouts?
This article has been archived and is no longer updated by Apple.
The Indian Language Kit offers two different layouts--Inscript and QWERTY--for each of the three Indian language scripts it presently supports (Devanagari, Gujarati, and Gurmukhi). An additional layout, Nepalese, is also provided for the Devanagari script only. Choose the layout according to the script and language you are using.

Inscript
The default layout--Inscript--is available for all three scripts. Inscript uses the ISCII (Indian Script Code for Information Interchange) character set and is used for "normal" or phonetic typing. It is generally accepted as the standard Indian language keyboard layout as defined by an Indian standards organization in the Indian Government. It is optimized to be the fastest form of keyboard input for each script.

Using the Inscript layout, the computer combines these characters to form the large number of conjuncts used in Indian languages. This means that when you are typing in an Indian language, you do not have to search for the correct half-character sets to form a conjunct. When you type a certain sequence of consonants and vowels, the computer automatically generates the required character. Using the Inscript layout you can type the words according to how they sound, rather than how they finally appear on your screen. The computer automatically reorders vowels and consonants to produce the desired words in all three languages.

The default (Inscript) keyboard layouts for all three Indian language scripts also support the Roman script when you hold down the Option key.

QWERTY
The QWERTY keyboard layouts place Indian language characters on a QWERTY keyboard, in positions that correspond to Roman characters with similar pronunciation. They also provide a set of Roman numerals in the Option position. QWERTY is used primarily for Romanized typing.

Note: The QWERTY keyboard layout is used in the United States and displays the top-left keys on the keyboard in that order--Q W E R T Y. The Indian Language Kit currently does not provide a way to customize the layouts for AZERTY (French), QWERTZ (German and Swiss-French), QZERTY (Italian) or any other transliterated layout. Instead, use the Typing Tutor, included in the CD-ROM disc, to learn the Inscript keyboard.

Nepali
The Nepali keyboard layout is used only with the Devanagari script and is compatible with the mechanical keyboard layout used in Nepal. The Nepali layout was added for Nepali users used to the traditional Nepali typewriters and is simply a rearrangement of the other Devanagari layouts.

Layout Installation
If you install all the keyboards in the Indian Language Kit, they appear in this order in your Keyboards menu:

- Devanagari
- Devanagari QWERTY
- Nepali
- Gurmukhi
- Gurmukhi QWERTY
- Gujarati
- Gujarati QWERTY

Network Assistant 4.0.x: Copying Invisible Files

This article describes which invisible files Network Assistant can be copied from a hard disk.
This article has been archived and is no longer updated by Apple.
Network Assistant, part of the Apple Network Administrator Toolkit (ANAT), will not copy invisible files at the root (first) level of the hard disk. This includes the desktop folder, trash, temporary items folder, and others.

Network Assistant can copy invisible files that are not at the root level of the hard disk.

This article was published in the 18 February 1997 "Information Alley."
Published Date: Feb 20, 2012

Mac OS 7.6: System Requirements

What are the system requirements for installing Mac OS 7.6?
This article has been archived and is no longer updated by Apple.
The following computers can install Mac OS 7.6:

- Computers with PowerPC microprocessors
- Computers with 68040 microprocessors
- Computers with "32-bit clean" 68030 microprocessors. All computers with 68030 microprocessors are 32-bit clean except the Macintosh SE/30, Macintosh IIx, and the Macintosh IIcx.

In addition, to install Mac OS 7.6, a computer must have at least 8 MB of RAM (random-access memory). If your computer has less than 16 MB of built-in RAM, you must use virtual memory. (Mac OS 7.6 automatically turns on virtual memory when you install it.)

To install the recommended software, you need about 70 MB of free space on your hard disk. To install all the optional components, you may need up to 120 MB of disk space; if you install just the minimum set of system software, you may only need 40 MB. The exact amount of space needed varies for different computer models and hard disk sizes.

Laser Printers: Printing In Binary Data Mode

I have a Windows NT Server based network with a group of laser printers. I want to output print jobs in binary data format to the printers. I have not been able to find a way for Mac OS-based computers to print using binary mode. Can you help?
This article has been archived and is no longer updated by Apple.
By default, Mac OS-based computers communicate using ASCII data format mode. Although Mac OS-based computers do not have an option to print directly using binary data format mode, there is a way it can be done.

Using the LaserWriter 8 driver, you can save the PostScript file in binary data format. The resulting PostScript file can then be sent to the printer using the Apple Printer Utility or the LaserWriter Utility.

Power Macintosh: Setting up for Use Without a Monitor

This article explains how to set up a Power Macintosh computer so you can use it without a monitor.
This article has been archived and is no longer updated by Apple.
In some cases you may want to use a Power Macintosh computer without a monitor connected to it. For example, if the computer is an AppleShare IP server, running it without a monitor provides an additional level of security. Using a computer this way is sometimes called "headless" operation. Without a monitor, you can only administer the server using the remote administration software.

To use a Power Macintosh computer without a monitor connected to you it, you will need to connect a display adapter to make the computer behave as if a monitor were connected to it. You can use the monitor adapter that came with your computer if it was part of the accessory kit, or you can use a non-Apple adapter available from several third-party companies. Use the search keyword "monitor adapter" at the Macintosh Products Guide (http://www.apple.com/guide/) to find a third-party adapter. See Note 1.

For additional information on using a computer without a monitor connected to it, refer to these articles:
58186: "**Power Macintosh G3 (Blue and White): Video Adapter Necessary for Headless Operation**"
24417: "**Macintosh Server G3: Setting Up For Remote Administration**"

Apple Monitor Adapters

This table outlines the Apple monitor adapters for use with specific Power Macintosh computers.

Computer	Adapter	Availability
Macintosh Server G3		Included in accessory kit
Macintosh Server G3 (Blue and White)	part 922-3764	Included in accessory kit
Power Mac G4 (PCI Graphics) Power Mac G4 (AGP Graphics) Power Mac G4 (Gigabit Ethernet) See Note 2.	part 922-3764	Purchase from Apple Authorized Service Provider

Notes

1. You can also make a simple jumper plug to run a computer without a monitor connected to it. For additional information refer to article 15987: "**Macintosh Monitor Sense Codes: Technical Description".**
2. The Power Mac G4 (Digital Audio), Power Mac G4 (QuickSilver), Power Mac G4 (QuickSilver 2002), and Power Mac G4 (Mirrored Drive Doors) computers do not require an adapter in Mac OS 9.
3. Most Power Macintosh computers not listed in the table above can be used without a monitor connected to them, and without a monitor adapter connected to the monitor port. If the computer does not work without a monitor connected to it, connect a monitor adapter to the computer's monitor port.
4. If you use the computer without a monitor connected to it, you should turn off any screen savers.

MacDNS: Recursive DNS Server or Not

This article discusses recursive lookup, recursive DNS servers, and MacDNS.
This article has been archived and is no longer updated by Apple.
In a "recursive" lookup, the DNS server is always expected to find the definitive answer for any query. Sometimes the response to a lookup is not the actual answer, but a pointer to another name server which might know the answer. A non-recursive DNS server simply returns this pointer, rather than the final answer. A recursive DNS server contacts the new name server and asks it the original question, and repeats the process until the answer is found.

MacDNS 1.0.x functions as a "forwarding" name server. In order to resolve a name which is outside of the domain(s) it serves, MacDNS forwards the request to a parent DNS server, which then performs a recursive lookup. Normally, this parent server is your ISP's DNS server. MacDNS does not perform the recursion itself. However, from the perspective of a DNS client, recursive service is delivered.
Published Date: Feb 20, 2012

MacDNS: Exporting Zone Files & Zone Transfers

This article explains how to export the zone files from MacDNS to a UNIX server.
This article has been archived and is no longer updated by Apple.
Zone transfers are used to propagate changes between domain name servers. Typically zone transfers occur on periodic basis controlled by timers at the secondary server. If your UNIX workstation is configured as a secondary server for this domain, it will automatically initiate zone transfers periodically. The zone transfer model uses a "pull" methodology governed by the secondary server rather than a "push" initiated by the primary server (MacDNS). Page thirty of the MacDNS Administrator's Guide provides some description of these timers.

On UNIX workstations, zone transfers can be initiated (that is "pulled") using the named-xfer command. To force an immediate transfer you can use a command like this:

named-xfer -z company.com -f /tmp/db.company -s 0 primary.company.com

This requests a transfer of zone files for the domain "company.com" from the domain name server named "primary.company.com". The -f option specifies that the resulting zone file will be saved in file named /tmp/db.company. The -s flag forces an immediate transfer since a serial number of zero will always be less than the primary server's zone file serial number and indicates that a zone transfer is needed to update the local copy.

If what is desired is merely an ascii file containing the zone file, this already exists in standard format on the workstation running MacDNS and can be copied as needed. By default this file bears the same name as the domain it contains entries for (for example, company.com).

Modem Control Panel: Modem Not Listed

This article describes what to do if a particular modem is not listed in the Modem control panel.
This article has been archived and is no longer updated by Apple.
Ideally, you should obtain a modem script from your modem vendor and place it in the Modem Scripts folder (System Folder:Extensions:Modem Scripts). The scrollable list of modems in the Modem control panel corresponds to the scripts in this location.

If you are unable to obtain a script from you modem vendor, you can request a recommended initialization string to use with PPP connections. With that connection script in hand you can use the following workaround:

1. Select "Null Modem 57600" in the Modem window of the PPP control (example: AT&F0) panel and close the window.
2. Select "Options" at the bottom of the PPP control panel.
3. Select the Protocol tab.
4. Place an "X" beside "Connect to a command line host" and beside "Use terminal window" and close this window.
5. Click "Connect". NOTE: At this point you have a terminal window and any text input from the keyboard will go directly to the modem after pressing the return key.
6. Enter the recommended initialization string from your modem vendor followed by the return key. The modem should respond with "OK" in the terminal window.
7. Enter the command string to dial your ISP's PPP server (example: ATDT9,555-1212).
8. Respond to the ISP server's prompts for username and password. If the login is successful, the terminal window will close and you will be prompted to save a connection script based upon the terminal window session.
9. To use this script for future PPP connections, select the "Options" button once again in the PPP control panel. This time in the Protocol section place an "X" beside "Connect to a command line host" and "Use a connect script".
10. Select the "Import Script" button.
11. Select the script saved in step 8 above and click "Open".

Subsequent PPP connection attempts will now use this custom script.

Apple Language Kit: Sending email In Other Languages

This article discusses using an Apple Language Kit with an email application and the associated obstacles.
This article has been archived and is no longer updated by Apple.
There are numerous obstacles to having multilingual email over the Internet which include:

1. The email application
2. Requirements for fonts or language kits to be installed
3. Gateways
4. The need for Unicode, 32-bit file systems

Here's why:

1) The e-mail application
With the possible exception of CyberDog, we are not aware of an Internet email program that is 2-byte font aware. A "closed" system (without Internet access) like QuickMail, may work properly if other requirements like fonts, language kits, gateways, and so on are met.

2) Requirements for fonts or language kits to be installed
The correct font is required to view the associated glyphs or characters. As an example, if the receiving font is missing a glyph (for instance, a "y"), then the word might appear "gl_ph" with a square (control character) or other character, based on various character mapping possibilities. Since different platforms map their fonts differently, another level of complexity gets added. Additionally, a secondary language script associated with a language kit like JLK may also be required. There's also setting a font like Osaka for JLK (in the Views control panel), so 2-byte filenames and folder names can be used by the Finder. For anyone who has used the Apple Language Kits, this should already be clear.

3) Gateways (This term means any intervening steps through which an email message passes--not the strict network definition.)
On a recent email test from Japan that we received, the KanjiTalk examples were corrupted by intervening gateways.

4) The need for Unicode 32-bit filesystems, which would (theoretically) support any font in filename space, and eventually across all major platforms.
The Mac OS today, as well as DOS/Windows, NeXTStep, OpenStep, and others may use 7-bit filesystems (with some variances). So the answer, ultimately, is to have files and directories on all platforms map to a common Unicode 32-bit name space which would allow for names to appear properly.

AppleShare IP: Simultaneously Mounting Two Servers Over TCP/IP

I have two AppleShare servers on my network. I can connect to either one individually just fine. However, if I try to log on to the second server after I already have a volume from the first server mounted, I get a message that I am already logged on.
This article has been archived and is no longer updated by Apple.
When the client connects to a new server, it checks to see if the server is already mounted. It does this by comparing server signatures. The server signature is an identifier which is unique to each server. If no signature is present it will check the server addresses and server names. If the server signature is the same, the client will think that you are trying to log into the same server again and will give you a choice of volumes from the original server.

The server signature is derived from the serial number, so if there is difficulty mounting two servers, check that each server is using a unique serial numbers.

If you are using AppleShare 6.0, 6.1, or 6.1.1, there is an issue which can prevent the server signature from being properly updated. This can come up if you change the serial number on the server, or if you are upgrading with an old User & Groups data file which has an AppleShare 4.x serial number. AppleShare 6.2 addresses this issue.

AppleShare IP 5.0: Mail Forwarding

This article describes how to set up an AppleShare IP mail server on separate Workgroup Server using only one AppleShare IP serial number.
This article has been archived and is no longer updated by Apple.
Follow the instructions below:

1. Setup the primary AppleShare IP server.
2. Create user accounts on this primary server.
3. For mail users, set Mail Forwarding to enable for each user to be installed on the second mail server. Type the DNS name for the second mail server in forwarding field. (Pages 205 to 210 of the AppleShare IP 5.0 Administrator's Manual describe this process in greater detail). Export the Users and Groups file and copy it for the second mail server.
4. Install the mail server plus the Web/File server options on the second mail server. Run the AppleShare Easy IP Setup program on this Mail server and use the same serial number as the primary AppleShare IP server. When prompted to start the servers, DO NOT DO SO.
5. Using the AppleShare IP Mail Admin application, manually start the AppleShare IP Manager application.
6. Import the previously created Users and Groups file.
7. Edit users with the IP Manager and enable mail for each user on this mail server.

AppleShare IP 5.0 and Multi-Launch Applications

This article describes how AppleShare IP 5.0 works differently from AppleShare 4.x with regard to multi-launch applications.
This article has been archived and is no longer updated by Apple.
AppleShare IP 5.0 works differently with multi-launch applications. AppleShare 4.x servers would let the server administrator set from one to 250 concurrent launches for any application, whether it supported multiple launches or not.

The Finder supports a file flag called "isShared" which reports if a program is designed to be launched by multiple simultaneous users. AppleShare IP Admin now looks at that field, and enforces its setting. To summarize:

AppleShare 4.x

- isShared Finder bit is ignored
- AppleShare Admin lets up to 250 concurrent launches (250 is the default)
- Concurrent launches are restricted to the number set in this AppleShare Admin panel

AppleShare IP 5.0

- isShared Finder bit is used to determine "configurability" of concurrent launches
- If bit is clear, AppleShare IP Admin cannot configure concurrent launches, only one launch is allowed
- If bit is set, AppleShare IP Admin can allow up to 250 concurrent launches

Mac OS 8: AppleShare IP 5.0 Memory Issue

I installed Mac OS 8.0 and AppleShare IP 5.0.x on my server. Now I cannot launch other applications even though my largest unused block of memory is enough to launch those applications. What can I do?
This article has been archived and is no longer updated by Apple.
AppleShare IP places its file memory cache in the Mac OS segment as listed in the About this Computer command under the Apple Menu. With Mac OS 8.0, the About this Computer allocation for Mac OS does not account for the cache AppleShare IP sets aside for its use. As a result, it appears a larger amount of memory is accessible in the Largest Unused Block than is actually available. The AppleShare IP file cache memory is in use, but is not accounted for in this window.

You need to adjust the cache allocated for other applications in the AppleShare IP Web & File Admin application. Open AppleShare IP Web & File Admin and choose Web & File Server Settings command under the Server menu. Select Cache from its pop-up menu and increase the memory allocated for other applications. Save the new cache setting before closing the window.

Note: This does not occur with Mac OS 7.6.x.

Power Macintosh G3: Ethernet Fails

This article describes a situation with a Power Macintosh G3 attached to an auto-sensing 10/100 MB Ethernet hub or switch, where the computer fails to attach to the network.
This article has been archived and is no longer updated by Apple.
A 10/100 MB auto-sensing hub polls the interface to determine the speed. In the process of the hub attempting to determine the interface speed, the Ethernet driver in the Power Macintosh G3 computers is performing a self diagnostic. Unfortunately the Ethernet driver completes the self diagnostic before the hub has determined the link speed and therefore determines that the network is down.

Products Affected
Power Macintosh G3 Desktop 233
Power Macintosh G3 Desktop 266
Power Macintosh G3 Minitower 233

Solution
Updating the Ethernet driver to Power Macintosh G3 Ethernet (Built-in) v2.0.4 will solve this issue. The driver Power Macintosh G3 Ethernet (Built-in) v2.0.4 is available on Apple Computer's software update locations.

This article can help you locate the software update mentioned here:

- Article 14724: "**Where To Find Apple Software Updates**" - Lists online services for free Apple software updates.

Power Macintosh G3: Does Not Have a Comm Slot

Does the Power Macintosh G3 have a Comm Slot?

This article has been archived and is no longer updated by Apple.

The Power Macintosh G3 comes with a modem slot on the Personality Card. This slot lets you install Apple's 56kbps modem card which is available as a build-to-order option. While this slot has the same dimensions as those found with Comm Slot II, it does not use Comm Slot II protocols. Comm Slot II cards other than Apple's 56kbps modem card will not work in the Personality Card's modem slot.

Internet Assistant 1.0 and Apple Remote Access 3.0 Incompatibility

This article discusses a compatibility issue with Internet Assistant 1.0 and Apple Remote Access (ARA) 3.0.
This article has been archived and is no longer updated by Apple.
There is a known incompatibility between Internet Assistant 1.0 that ships with Mac OS 8 and ARA 3.0. One of the symptoms is the lack of a CCL list. To resolve this issue, you need to upgrade Internet Assistant to version 1.0.3 which is available on Apple's Software Update locations.

This article can help you locate the software update mentioned here:

- Article 14724: "**Where To Find Apple Software Updates**" - Lists online services for free Apple software updates.

Published Date: Feb 20, 2012

Power Macintosh G3: Error in Apple Video Player on Second Monitor

This article discusses an issue with Power Macintosh G3 computers with multiple monitors using Apple Video Player.
This article has been archived and is no longer updated by Apple.
The Power Macintosh G3 desktop and minitower computers include an ATI 3D RAGE II+DVD Graphics Controller chip on the logic board to provide on-board video. Power Macintosh G3 computers use the audio/video card option to provide video in/out capabilities. The audio/video card works in conjunction with the on-board ATI 3D RAGE II+DVD Graphics Controller chip to provide video-in services.

When an application is trying to capture video on a monitor attached to a PCI video card, the ATI chip's services are not available and returns an error to the application (ie. Apple Video Player) requesting video-in services. This symptom can also occur if the menu bar is on the monitor attached to the PCI video card.

For this reason, Power Macintosh G3 users should always capture video on the monitor that is attached to the on-board video connector to avoid this error message. Addtionally, the menu bar should be on the monitor attached to the on-board video connector.
Published Date: Feb 20, 2012

Power Macintosh G3: A/V Personality Card Only Support Video Mirroring

This article discusses using the A/V Personality Card for video mirroring and issues associated with adding a second monitor.
This article has been archived and is no longer updated by Apple.
The A/V personality card that comes with some Power Macintosh G3 configurations can only mirror the built-in video port.

If you wish to add a second monitor (or TV) and use it as an extended desktop, that can be accomplished by the addition of a third-party PCI video out card.

Notes:
1) It is not necessary for the Power Macintosh G3 to have 4 MB SGRAM to do video mirroring. You can attach a TV or second monitor to the RCA video out jacks of the A/V Personality card and do video mirroring with only 2 MB SGRAM.

2) Power Macintosh G3 All-In-One models will also support video mirroring from the DB-15 port on the back of the computer. This port does not support extended desktop viewing.
Published Date: Feb 20, 2012

Mac OS 8.1: FM Radio Installation

After the Mac OS 8.1 Update, the installer reported it is unable to replace the Apple FM Radio application. I then reinstalled the software that came with my TV/FM Radio System, but when I opened Apple FM Radio I got the following error message, "The FM Radio Component in the Extensions folder is not the correct version."
This article has been archived and is no longer updated by Apple.
Mac OS 8.1 Update installs Apple FM Radio application v1.4.1 and FM Radio extension v1.2. (These versions are required by Mac OS 8.1.)
The Mac OS 8.1 Update installer will not install this Apple FM Radio software if the older versions have not been previously installed, or the software is not located where the installer expects to find them.

The Mac OS 8.1 Update installer looks in the follows locations for older versions of the FM Radio software:

- Apple FM Radio - in the Applications folder of the Hard Drive
- FM Radio - in the Extensions folder of the System Folder

Important: The Apple FM Radio application should reside at the root level of the Applications folder. If the Apple FM Radio application is not in this location, the Mac OS 8.1 Update installer will not find the application and will not update it.

If you do not have the original installation disks for the TV/FM Radio System, you can force the Mac OS 8.1 Update installer to install the correct version of Apple FM Radio and FM Radio by placing "dummy" files (not folders) in the locations specified above. Follow the steps below

1. Create two SimpleText documents.
2. Save one with the name "Apple FM Radio" and the other with the name "FM Radio Extension".
3. Put the "Apple FM Radio" file in the Applications folder, and the "FM Radio Extension" file in the Extensions folder.
4. These "dummy" files will then be replaced with the real software by the Mac OS 8.1 Update installer.

Also, the Mac OS 8.1 Update installer does not provide a new Apple FM Radio Guide file which has not been revised since the original version. If you need the FM Radio Guide file, it can be found on the install disks for the TV/FM Radio System.

Printers & Imaging: Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding Printers & Imaging, with answers to those questions.

Note: This document applies to Mac OS 9 and earlier.

If the questions below do not contain an answer to something you are looking for, you can continue to search for an answer by using the Search function here within the Knowledge Base or you can go to the **Older Apple Products** Discussions.

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. I have a Power Macintosh G3 computer running Mac OS 8.1, and a printer connected via LocalTalk to my printer port. However, when I click on the printer driver in the Chooser, the printer name does not show up in the Chooser. Why is the printer not seen?
2. Since installing Mac OS 8, I receive various desktop printing error messages. What is causing this and how can I resolve it?
3. I have a Color LaserWriter which has a background haze over the entire printable surface, I have changed toners, and photo conductor along with cleaning the transfer drum. What is causing this haze?
4. After installing Mac OS 8 or 8.1, when I try to scan an image with my Color OneScanner the computer freezes. Is the software not compatible with Mac OS 8.0 or later?
5. How can I connect multiple serial devices to my Macintosh when I have no serial ports available?
6. What communication mode do the switches on the back of my LaserWriter place the ports in?
7. My Color StyleWriter 2400 keeps giving me an error indicating that the waste ink tank absorbers are full and will not let me print. Why am I getting this error message and how do I correct it?
8. I am having problems printing to my LaserWriter using TCP/IP. Is there documentation that may assist me?

Question 1: I have a Power Macintosh G3 computer running Mac OS 8.1, and a printer connected via LocalTalk to my printer port. However, when I click on the printer driver in the Chooser, the printer name does not show up in the Chooser. Why is the printer not seen?

Answer: Removing or disabling the LocalTalk PCI extension should resolve the issue. For more information, refer to article 24476: "**LocalTalkPCI Extension: LocalTalk Printing Difficulties**."

Question 2: Since installing Mac OS 8, I receive various desktop printing error messages. What is causing this and how can I resolve it?

Answer: If you revive any of the following errors, follow the troubleshooting steps in article 24306: "**Mac OS 8: Desktop Printing Troubleshooting**."

- choose print and nothing happens or jobs hang in the queue
- choose print and get "printer not found" message
- choose print and get message "The file 'XXX' will be moved to the desktop because it is not a valid print file"
- setup printer in chooser and no desktop printer created (exception being StyleWriter 4000 series)
- -192 errors caused by desktop printing
- multiple desktop printers for same printer created on desktop
- "flashing" desktop printer icon (disappears and reappears)
- cannot create a desktop printer icon

Question 3: I have a Color LaserWriter which has a background haze over the entire printable surface. I have changed toners, and photo conductor along with cleaning the transfer drum. What is causing this haze?

Answer: The background haze is usually caused by a low humidity condition. Generally, the background will be grayish in color, however, the background haze color can be, predominately, any of the colors. To eliminate the background haze try to raise the humidity level with a humidifier. Also, keep the media you print on in the same room that you have the printer in.

Question 4: After installing Mac OS 8 or 8.1, when I try to scan an image with my Color OneScanner the computer freezes. Is the software not compatible with Mac OS 8.0 or later?

Answer: The issue you are describing is caused by Virtual Memory being set to On in the Memory control panel. The issue is resolved with the Dispatcher-Ofoto driver 4.2, described in article 21132: "**Dispatcher Software: Virtual Memory Issue**."

Question 5: How can I connect multiple serial devices to my Macintosh when I have no serial ports available?

Answer: There are third-party solutions that provide multiple serial ports, such as PCI and NuBus cards along with external hardware devices. Third-party solutions are supported by the manufacturer. Three third party manufacturers are:

- Momentum
- Silicon Valley Bus Company
- Keyspan

Refer to article 21119: **"Mac OS: Third-Party Software and Hardware Guide."** for help in searching for third-party solution:

- A

Question 6: What communication mode do the switches on the back of my LaserWriter place the ports in?

Answer: The communication mode is dependent upon which LaserWriter you have. To find out which communication mode the switch(s) place the ports in on various LaserWriter printers, refer to article 24318: "**LaserWriter: Communication Mode Switch Setting Articles**."

Question 7: My Color StyleWriter 2400 keeps giving me an error indicating that the waste ink tank absorbers are full and will not let me print. Why am I getting this error message and how do I correct it?

Answer: Before taking the printer to a service provider try clearing the EEPROM. Step by step instructions can be found in the following Knowledge Base articles.

- Article 17045: "**Color StyleWriter 1500, 2400 & 2500: Waste Ink Absorbers Full Error**."
- Article 21234: "**Color StyleWriter 2200: Resetting Waste Ink Amount**."

Question 8: I am having difficulty printing to my LaserWriter using TCP/IP. Is there any documentation that may assist me?

Answer: Yes, Knowledge Base article 20148: "**LaserWriter Printers: TCP/IP Solutions Guide**." may help resolve your issue.

Power Macintosh: MacIPX Errors

The two errors below may occur when using NetWare Client for Mac OS v5.11 with Power Macintosh computers:

1. When attempting to configure MacIPX on a Power Macintosh G3, the following error is reported: "Network interface Ethernet could not be selected due to error: -43 (0xffd5) please configure the Ethernet interface to ensure that the network driver can open properly."
2. When attempting to log in to the NetWare file server using the Novell Login Menu or mounting a volume through the NetWare Directory Browser, the following error is reported: "There may be a problem with your network connection or MacIPX may not be configured properly. Use the MacIPX control panel to configure MacIPX."

This article has been archived and is no longer updated by Apple.
The MacIPX Ethernet extension was updated to let MacIPX initialize normally when attempting to log into the NetWare file server.

The error message returned in item 2 above indicates that the MacIPX driver has not been opened. If you open the MacIPX control panel, you will see the Network Number and Node Number displayed as "N/A (driver not open)", which is normal after restarting the computer.

Note: NetWare is now owned by Prosoft Engineering. Refer to their website for additional information on updates.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

7.6 Device Mgr Server Update and Mac OS 8.x

Should I remove the 7.6 Device Mgr Server Update extension if I've upgraded my server to Mac OS 8 or 8.1? Is it essential to the operation of AppleShare IP (ASIP) 5.0.x?

This article has been archived and is no longer updated by Apple.

The 7.6 Device Mgr Server Update extension gets installed by ASIP 5.0.2 if the target system is Mac OS 7.6.x. The extension is not installed if the file server has Mac OS 8.0 or 8.1. If Mac OS 7.6.x is then updated to Mac OS 8.x, the 7.6 Device Mgr Server Update extension is not removed during the installation process. This extension also shows as part of the ASIP 5.0.2 package in the Extensions Manager. The functionality of this extension has been rolled into Mac OS 8 and 8.1, therefore you should remove the 7.6 Device Mgr Server Update extension.

Disk First Aid 8.1: What‘s New

This article describes the differences between Disk First Aid 8.1 and 7.2.4 and why version 8.1 larger than 7.2.4.
This article has been archived and is no longer updated by Apple.
Here are the differences between Disk First Aid 8.1 and 7.2.4:

- Disk First Aid 8.1 has been updated to support Mac OS 8.1's new Mac OS Extended Format.
- Disk First Aid 8.1 now incorporates the File Manager's built in verification and repair functionality called "MountCheck". By including the MountCheck code in Disk First Aid (DFA) 8.1, DFA guarantees that it will catch all the same things MountCheck finds during startup.
- Disk First Aid 8.1 is more thorough than Disk First Aid 7.2.4 at rebuilding directory catalogues if minor problems are found.
- Disk First Aid 8.1 now checks for custom icon problems for all folders, not just the root of the hard drive.
- Users can now mount a drive by double-clicking the drive's icon in Disk First Aid 8.1.
- Disk First Aid 8.1 includes more error messages than DFA 7.2.4.

To incorporate all of these updated features, Disk First Aid 8.1 has grown to about 156K in size for the version included on the Mac OS 8.1 CD. A smaller version of Disk First Aid 8.1 is included on the Mac OS 8.1 Disk Tools PPC disk which is around 96K. This version functions identically to the CD version but has compressed and reduced resources that enable it to fit on the Disk Tools disk.

QuickTime: Frequently Asked Questions

This document contains frequently asked questions (FAQ) regarding QuickTime in general, with answers to those questions. For FAQs about QuickTime 4, refer to the QuickTime 4 FAQ.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. How do you obtain support for QuickTime?
2. What is QuickTime Pro?
3. How do I obtain QuickTime Pro software?
4. What options do I have for ordering QuickTime Pro access keys?
5. How can I obtain a QuickTime CD-ROM?
6. If I am not completely satisfied with QuickTime Pro how do I get a refund?
7. I ordered a QuickTime Pro access key for the wrong operating system. How can I exchange my key?
8. I placed an order via the web and did not receive an email confirmation. What should I do?
9. I believe I was charged multiple times for a single transaction. What should I do?
10. My system disconnected while downloading QuickTime. How can I download the software without being charged again?
11. What should I do if my QuickTime Pro access key does not work?
12. Will the QuickTime installer remove any older versions of QuickTime?
13. What technical support resources are available for QuickTime (or QuickTime Pro)?
14. I've lost my access key for QuickTime Pro. Where can I find my key?
15. My credit card has been charged incorrectly. Who should I call?

Question 1: How do you obtain support for QuickTime?

Answer: You may call + 1 512 674 8700 to get complimentary installation and launch support. If you have recently purchased a Macintosh computer or a new Mac OS release, you may also be eligible to receive technical support with a toll free call. Refer to your in-box materials for support options included with your purchase. In addition to telephone technical support, Apple has extensive online support for QuickTime. Online support and other information for QuickTime can be found at these sites:

http://www.apple.com/quicktime
http://www.apple.com/support/quicktime/

Question 2: What is QuickTime Pro?

Answer: QuickTime Pro is the same software package as QuickTime (either downloaded or on CD-ROM). By entering a special "Pro Key" in the QuickTime Settings control panel, you unlock several new features to your existing software. See "QuickTime: Differences Between QuickTime and QuickTime Pro."

Question 3: How do I obtain QuickTime Pro software?

Answer: The QuickTime software can be downloaded from Apple's QuickTime site. QuickTime contains all the QuickTime Pro functionality, but the Pro features are locked out until you enter the access key.

Question 4: What options do I have for ordering QuickTime Pro access keys?

Answer: You can order through the the QuickTime Upgrade page and the Apple Store from most countries using a credit card. You can also call 1 (800) 676-2775 (a toll-free number) from the US and Canada using a credit card.

Question 5: How can I obtain a QuickTime CD-ROM?

Answer: Apple does not provide QuickTime on CD, it is only available as a software download.

Question 6: If I am not completely satisfied with QuickTime Pro how do I get a refund?

Answer: Refunds are not available for QuickTime Pro.

Question 7: I ordered a QuickTime Pro access key for the wrong operating system. How can I exchange my key?

Answer: You should contact Apple for assistance.

Question 8: I placed an order via the web and did not receive an email confirmation. What should I do?

Answer: If a Confirmation of QuickTime Pro Upgrade message was not displayed by your browser at the time of purchase, then your order did not go through successfully. You should place a new order. If a Confirmation of QuickTime Pro Upgrade message was displayed by your browser at the time of purchase and you have not received an email, it is likely we have the wrong email address. If you printed the confirmation message,

keep this for your files. It is adequate proof of purchase. If you did not print the confirmation and need to know your access key, call 1 (800)676-2775.

Question 9: I believe I was charged multiple times for a single transaction. What should I do?

Answer: Due to address verification problems on your credit card, it may appear that you were charged multiple times. If this happened, we apologize but the authorization should only remain for a day or two. Your card should only be charged once and for the correct amount.

Question 10: My system disconnected while downloading QuickTime. How can I download the software without being charged again?

Answer: There is no charge for downloading QuickTime. You are only charged for the access key(s). If your download did not complete successfully, then please download the software again.

Question 11: What should I do if my QuickTime Pro access key does not work?

Answer: Please verify that you have downloaded QuickTime and are entering the correct access key. Open your QuickTime Settings control panel, choose Registration from the popup menu, and enter your name and key exactly as they appear on your Confirmation of QuickTime Pro Upgrade message. Be sure you do not enter any additional characters, including spaces. Also note that QuickTime Pro access keys are case-sensitive.

Question 12: Will the QuickTime installer remove any older versions of QuickTime?

Answer: **Mac OS:** The QuickTime installer replaces your older versions. Your QuickTime plug-in is also replaced with the new backward compatible plug-in. If your QuickTime folder is in the root level, your original version of MoviePlayer or QuickTime Player is updated.

Windows: QuickTime 3 does not replace QuickTime for Windows 2.1.2 because older versions of titles and applications may depend on these files. QuickTime for Windows beyond version 3 does replace versions later than 2.1.2.

Question 13: What technical support resources are available for QuickTime (or QuickTime Pro)?

Answer: Apple offers a variety of support options for QuickTime.

Question 14: I've lost my access key for QuickTime Pro. Where can I find my key?

Answer: It is very important to retain a printed copy of your Confirmation of QuickTime Pro Upgrade message. If you need your access key, call 1 (800)676-2775.

Question 15: My credit card has been charged incorrectly. Who should I call?

Answer: If you ordered by phone, call 1 (800) 676-2775; they will investigate the charge. If you ordered through the World Wide Web, call your credit card company and have them investigate the charge.

Question 16: Can I purchase QuickTime Pro if there is no online Apple Store for my country?

Answer: Unfortunately there is no way to purchase QuickTime Pro in countries where there is no online Apple Store.

Apple Hard Disk: Driver Matrix

This article provides a table showing the SCSI or ATA (IDE Disk) driver version associated with the drive utility listed. This information is available by highlighting the hard disk and selecting Get Info under the File menu.
This article has been archived and is no longer updated by Apple.

Drive Utility Name	SCSI Driver	ATA (IDE disk) Driver
Drive Setup 2.0.7	v 8.1.4	ATA 0, v3.2.8
Drive Setup 1.8.1	v 8.1.4	ATA 0, v3.2.4
Drive Setup 1.8	v 8.1.3	ATA 0, v 3.2.3
Drive Setup 1.7.3	v 8.1.2	ATA 0, v 3.2.2
Drive Setup 1.7.2	v 8.1.2	ATA 0, v 3.2.1
Drive Setup 1.7.1	v 8.1.2	ATA 0, v 3.2
Drive Setup 1.7	v 8.1. 1	ATA 0, v 3.2
Drive Setup 1.6.1	v 8.1.1	ATA 0, v 3.14
Drive Setup 1.6	v 8.1.0	ATA 0, v 3.13
Drive Setup 1.5.1	v 8.1.0	ATA 0, v 3.13
Drive Setup 1.5	v 8.0.9	ATA 0, v 3.10
Drive Setup 1.4	v 8.0.9	ATA 0, v 3.0.8
Drive Setup 1.3.1	v 8.0.8	ATA 0, v 3.0.7
Drive Setup 1.3	v 8.0.8	ATA 0, v 3.0.5
Drive Setup 1.2	v 8.0.6	ATA 0, v 3.0.3
Drive Setup 1.1	v 8.0.4	--
Drive Setup 1.0.5	v 8.0.4	--

Apple Studio Display 15-inch LCD: No sound from external speakers

I have an Apple Studio Display 15" LCD, and I have connected external speakers to it. However, I am not getting any sound from the speakers. What am I doing wrong?

This article has been archived and is no longer updated by Apple.

The Studio Display will not provide audio output unless the display is in video mode. In other words, if you are using the 15-pin video connector and monitoring computer video output but not monitoring the C-video or S-video input , you will not get sound. For more information, consult page 50 of the Studio Display user manual.

If you are monitoring the C-video or S-video input, for example from a VCR, follow these steps:

1. Wire the audio output from the VCR to the audio input on the display.
2. Use amplified speakers connected to the audio output of the display.
3. Be sure the amplified speakers have power.

For more information on connecting external speakers and video devices to the display, as well as how to switch video modes, consult Chapter 5 of the Studio Display user manual.

QuickTime: Playback and Export of MPEG Video Files in QuickTime Player

QuickTime Player supports playback and export of different types of MPEG video files. This document details the MPEG video formats and how they are handled in QuickTime Player.
This article has been archived and is no longer updated by Apple.
The Moving Picture Experts Group (MPEG) is the name of a working group of the International Standards Organization (ISO). The MPEG formats standardized by the group are used for compressing and decompressing video and audio data in a digital format. MPEG files offer quality playback at much smaller file sizes than uncompressed video and audio files.

QuickTime is able to play standard MPEG-1, MPEG-2 (see Note 1) and MPEG-4 files. With QuickTime Player's Pro features unlocked (see Note 2), support is included for exporting MPEG-4 files.

- The MPEG-1 format was approved in 1991 and features quality approximating that of VHS video. Export and conversion of MPEG-1 video files is not supported in QuickTime.
- The MPEG-2 format is capable of very high quality, and is used for DVD-Video and digital television transmission. Apple's Final Cut Pro 4 and DVD Studio Pro include tools for encoding in the MPEG-2 format.
- The MPEG-4 format features scalable quality, and is ideally suited for audio and video streams over a wide range of bandwidths. MPEG-4 features the very high quality AAC audio codec.

Notes

1. Playback of MPEG-2 program and elementary streams is available via the QuickTime 6 MPEG-2 Playback Component, sold separately at the **QuickTime web site**.
2. A QuickTime Pro key unlocks export and media authoring capabilities in QuickTime Player. **Upgrade to QuickTime Pro**.

5500/6500 L2 Cache Disable Extension: What is it?

This article describes the software extension named "5500/6500 L2 Cache Disable" and whether it is needed on your computer.
This article has been archived and is no longer updated by Apple.
The "5500/6500 L2 Cache Disable" extension is obsolete and is no longer needed.

When the Power Macintosh 5500/225, 6500/225 and 6500/250 computers first began to ship in March, 1997, Apple received several reports of users having difficulty installing various software packages on their hard drive.

The symptom was typically an error message from an installer application stating that there was some kind of installation error. After a complete investigation, Apple found that a limited number of Power Macintosh 5500 and 6500 computers would experience this symptom depending on 256K L2 cache and logic board configuration.

During this investigation period, Apple distributed the "5500/6500 L2 Cache Disable" extension to temporarily disable the 256K L2 cache DIMM on the logic board until users could have their computer serviced by an authorized Apple service provider. This allowed users to install software on their computer without difficulty.

All Power Macintosh 5500/225, 6500/225 and 6500/250 computers in production after April, 1997 should not experience this issue. This issue can occur in only a small percentage of Power Macintosh 5500 and 6500 computers that fall within these serial number ranges:

- PM 5500 from TY705xxxxx to TY716xxxxx
- PM 6500 from XB708xxxxx to XB718xxxxx

Note: The L2 Cache Disbale Extension was removed from Apple Software Updates in May, 1998 and is no longer available.
Published Date: Feb 20, 2012

Mac OS 8: Internet Applications Require Certain Extensions

Internet application such as Internet Setup Assistant, a Web browser, or an email client require certain extensions. Error messages stating that files or extensions are missing indicate that certain extensions must be enabled or reinstalled.

This article has been archived and is no longer updated by Apple.

Symptom

Error messages appear when you open an Internet application such as Internet Setup Assistant, a Web browser, or an email client. The error messages state that one or more of these files or code fragments is missing:

- InternetAccessPPC
- SOM
- AppleScriptLib
- OTUtilityLib

Solution

This behavior may occur if you held the Shift key down at system startup time or if you chose the Mac OS Base Set of extensions in the Extensions Manager control panel, causing one or more extensions to be disabled.

1. Use the Extensions Manager to enable these extensions:
   - Internet Access
   - SOMobjeccts for Mac OS
   - AppleScriptLib
   - Shared Library Manager
   - Shared Library Manager PPC
   - all Open Transport extensions
2. Restart the computer.

If you still get error messages, the extension(s) may be unusable; perform a custom reinstallation of the affected extension(s).

PowerBook G3 Series: Menu Bar Items are Covered

This article discusses a menu bar viewing issue with PowerBook G3 Series computers, Now Up To Date, and Now Contact.
This article has been archived and is no longer updated by Apple.
After you install Now Up To Date and Now Contact, you may notice menu bar items are covered by other items or they are not drawn completely. To correct this situation, you need to turn the QuickContact control panel and QuickDay control panel off.
Turning off the QuickContact and QuickDay control panels should get the menu bar back to normal again. Another workaround is to turn off the clock using the Date and Time control panel.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

Apple Studio Display 15" LCD: PC Compatibility Card Error Message

This article provides a workaround to an error message with the Apple Studio Display 15" LCD and the PC Compatibility Card.
This article has been archived and is no longer updated by Apple.
There is an issue where you cannot use the APPLEVDO.INF file in the PC environment of a DOS Compatible Macintosh. The error message, "The specified location does not contain information about your hardware" appears. To correct this situation, copy the .INF file to a PC-formatted floppy, and when choosing have disk, point Windows to the floppy (A:) instead of the CD.

When the display is connected correctly and the software is installed in the Macintosh environment of the computer, the front controls are bypassed in favor of using the Monitors and Sound control panel. This is why you cannot access the built-in controls from the PC environment of the computer.

Temporarily disable the Monitors and Sound control panel by disabling the AppleVision extension, or disconnect the display ADB and start the Macintosh with the keyboard and mouse connected directly to the computer. Switch to the PC and adjust the display accordingly using the built-in controls on the front of the display. When finished activate the AppleVision extension, shut down, connect the ADB cabling, then restart.

Drive Setup 1.5: Read Me

Name: Drive Setup
Version: 1.5
Released: June 9, 1998

Requires:
Mac OS versions 7.6, 7.6.1, 8.0 or 8.1. If you are using a version of Mac OS prior to 7.6, it is not necessary to use Drive Setup 1.5 to update your hard disk drive.

Note: Drive Setup 1.5 was tested with and is supported with U.S. English System 7.1.2 through U.S. English Mac OS 8.1.

Description:
Drive Setup installs software (called a disk driver) that allows your computer to communicate with the hard disk. Use Drive Setup 1.5 to update your disk driver or to reinitialize a disk. Version 1.5 adds support for Power Macintosh G3 computers and fixes a bug where the write cache on some ATA drives was disabled following a restart. Please refer to the documentation included with this software for complete details.

Instructions:
This software consists of a self-mounting Disk Copy compressed image (.smi) file. Download this software to your hard drive and then double-click it to use it. You do not need Disk Copy to access .smi files.
This article has been archived and is no longer updated by Apple.
About Drive Setup 1.5

This document provides important information about Drive Setup 1.5.

Drive Setup installs software (called a disk driver) that allows your computer to communicate with the hard disk. Use Drive Setup 1.5 to update your disk driver or to reinitialize a disk. When you initialize a disk, all of its contents are erased. A version history is at the end of this document.

IMPORTANT: Using earlier versions of Drive Setup to update the driver can reintroduce issues resolved with Drive Setup 1.5

When to use Drive Setup 1.5

- Immediately after you set up your computer for the first time.
- Any time you install Mac OS versions 7.6, 7.6.1, 8.0 or 8.1 on your computer, you should use Drive Setup 1.5 to update the driver on your hard disk again. If you are using a version of Mac OS prior to 7.6, it is not necessary to use Drive Setup 1.5 to update your hard disk drive.

Note: Drive Setup 1.5 was tested with and is supported with System 7.1.2 through Mac OS 8.1.

At Ease and Drive Setup 1.5
If you are using At Ease 4.0, 4.0.1, or 5.0, and wish to update your hard disk driver using Drive Setup 1.5, please follow these steps before using Drive Setup 1.5. (If you are using At Ease 3.0 or earlier, these steps are not applicable.):

- Launch the At Ease Administration program.
- From the Security menu, choose System Settings.
- Make sure that the option "Prevent users from bypassing security by starting up from a floppy disk." is not selected.

Using Drive Setup 1.5 to Update a Hard Disk

This section describes how to use Drive Setup 1.5 to update your hard disk. You may have Drive Setup 1.5 on a CD or you may have downloaded Drive Setup 1.5 from an Apple Web site.

To use Drive Setup 1.5 to update your hard disk, follow these steps:

1. Back up your hard disk and turn off any hard disk security software. Using Drive Setup to update a hard disk driver with security software turned on may cause problems.

IMPORTANT: Apple strongly recommends that you make a copy of the information on your hard disk before you update the disk using Drive Setup.

2. Insert your system software CD in the CD-ROM drive and restart your computer using the CD.

To learn how to start up your computer using a system CD, see the user's manual that came with your computer.

3. Locate Disk First Aid on the CD and open the program.

4. Select your hard disk and click Repair.

Disk First Aid checks your hard disk and repairs problems it finds. For more information about Disk First Aid, see the user's manual that came with your computer.

5. When you're finished, quit Disk First Aid and restart your computer.

6. When your computer restarts, eject the system CD and use Drive Setup 1.5 as follows.

7. Open Drive Setup 1.5.

WARNING When Drive Setup opens, do not click Initialize. Doing so erases all the information on your hard disk.

8. Select your hard disk in the List of Drives list.

9. Choose Update Driver from the Functions menu.

IMPORTANT: If Update Driver is not available, your hard disk may be protected by security software. See the manual that came with the software to learn how to turn off security while you update the disk.

10. Click OK when a message appears telling you that you must restart your computer.

11. Quit Drive Setup when you see the message, "Driver update was successful."

12. In the Finder, choose Restart from the Special menu.

If you have problems or Drive Setup fails to update the disk, see the troubleshooting chapter in the user's manual that came with your computer.

IMPORTANT: If your computer has one or more previous versions of Drive Setup on the hard disk, Apple recommends that you replace these older version(s) of Drive Setup with version 1.5 of Drive Setup.

Recovering From Disk Problems

If, when you start up your computer using a system software CD, you see a message asking you to initialize your hard disk, do not click Initialize. It may be possible to recover the hard disk using Disk First Aid or another disk utility. To learn how to use Disk First Aid, see the troubleshooting chapter in the user's manual that came with your computer. If you are using another disk utility, see the manual that came with the software.

Initializing Your Hard Disk

If you need to initialize your hard disk, see the user's manual that came with your computer or the system software CD you are using to learn how to do so. When you are finished initializing and installing system software on your hard disk, use Drive Setup 1.5 to update your hard disk. See "Using Drive Setup 1.5 to Update a Hard Disk" earlier in this document.

Tips and Troubleshooting

* Update Driver command is dimmed

If the Update Driver command is dimmed, the desired disk is either not supported, or it's previously been updated with a non-Apple utility. If the disk isn't supported, check the instructions that came with your computer or disk to see if the manufacturer includes or recommends a disk utility, and use that utility to update the driver. If you have updated or formatted the disk with a non-Apple utility, you will need to use that utility again to perform the update. To ensure a successful update, obtain the latest version of the utility.

* Using Drive Setup with Energy Saver

Before you use Drive Setup to perform an extended operation, such as testing the disk, open the Energy Saver control panel and select Never for the Hard Disk Sleep option to prevent the hard disk from spinning down before Drive Setup is finished.

* Manually mounting volumes

TA21784_Drive_Setup_Read_Me.pdf

Drive Setup allows you to partition a hard disk into several volumes when you initialize the disk. You can also select whether or not to mount a volume automatically when you start up your computer by using the "Automount on startup" option. Beginning with Drive Setup 1.3, a more reliable method of mounting volumes automatically is being used, to ensure correct operation with virtual memory. You cannot use a disk utility program (for example, SCSI Probe version 4.3) to mount volumes manually if the program does not support the new way volumes are mounted. However, you can use Drive Setup to mount volumes manually.

* Reinstalling Additional Software

Some computers come with additional software installed. If you want to reinstall this additional software using the "restore" CD that came with your computer, quit Drive Setup before you reinstall the software. Icons will not appear on the desktop if Drive Setup is open when you reinstall the software.

* Waiting for initialization to complete

Sometimes Drive Setup indicates that it has finished initializing a disk when it has not completely finished. Wait for your new volumes to appear in the Finder before continuing.

Improvements to Drive Setup (version history)

* Version 1.5--Added support for Power Macintosh G3 computers. Fixes a bug where the write cache on some ATA drives was disabled following a restart.

* Version 1.4--Added support for Mac OS Extended format for Mac OS 8.1. Supports all Macintosh computers that are supported by Mac OS 8.1 as well as all computers supported by Drive Setup version 1.3.x.

* Version 1.3.1--Fixed a problem on ATA drives that in rare cases could cause the loss of files/hard drive after a shutdown with Mac OS 7.6.1 and 8.0 systems.

* Version 1.3--Updated to work with all Macintosh computers that are supported by Mac OS 8. Incorporates Mac OS 8 appearance. Takes full advantage of the increased throughput of Ultra SCSI-2 Fast/Wide drives.

* Version 1.2.5--Limited release for Power Macintosh Workgroup Servers 7350 and 9650. NOT RECOMMENDED for other computers. Superseded by later versions.

* Version 1.2.4--Updated to access drives with SCSI IDs greater than 7 (SCSI-2 Fast/Wide). Added the ability to repair a disk that is damaged by updating with Drive Setup 1.2.2 after initializing with Apple HD SC Setup 7.1.2 or earlier.

IMPORTANT Apple HD SC Setup should only be used with older 68k-based Mac OS computers.

* Version 1.2.3--Fixed a problem in which large reads and writes on the hard disks of Performa 6400 series computers could cause hangs. Added the ability to update from Apple HD SC Setup drivers.

* Version 1.2.2--Improved recognition of secured volumes. Made minor changes for compatibility with the Mac OS 7.6 Installer.

* Version 1.2.1--Limited release for a few Power Macintosh computers sold in some European markets. NOT RECOMMENDED for other computers. Superseded by later versions.

* Version 1.2--Includes SCSI MESH patch for PCI Power Macintosh computers. Added support for selected 68k-based Mac OS computers with internal ATA hard drives.

QuickTime 3: Routing MIDI Information

This article answers the following questions regarding QuickTime 3 and MIDI instruments:

- How do I route QuickTime MIDI information to a MIDI sound module or MIDI keyboard?
- The QuickTime Settings control panel only lists choices for "QuickTime Music Synthesizer" and "(No Synthesizer)." How do I add a new synthesizer configuration?
- How do I configure QuickTime to use my sound card for playing music and MIDI files, instead of using the QuickTime Music Synthesizer?

This article has been archived and is no longer updated by Apple.
You must first install a MIDI transport system in order to route QuickTime MIDI information to and from MIDI devices, or MIDI applications. Once installed, you will see additional pop-up menu choices for configuring the Synthesizer, MIDI port, and Channel options in the QuickTime Settings control panel.

NOTE: QuickTime 3 for Windows does not yet support MIDI output. As of June 1998, the QuickTime Music Synthesizer is the only available option.

The QuickTime Music Architecture supports MIDI input and output with the following MIDI transport systems:

- MIDI Manager developed by Apple Computer, Inc. **http://www.apple.com/**
- Open Music System (OMS) developed by Opcode Systems, Inc. **http://www.opcode.com/**
- FreeMIDI developed by Mark of the Unicorn, Inc. **http://www.motu.com/**

PowerBook G3 Series: Battery Adjustment

This article describes securing the battery in a PowerBook G3 Series computer.
This article has been archived and is no longer updated by Apple.
The batteries used in the PowerBook G3 Series require a slight push to get them to lock into place. You will hear a click as the battery locks in. To ensure that the battery is locked in place, try pulling the battery out by the bottom lip.

If the battery is not locking into position, perform the following simple procedure:

1. Place the PowerBook on its back on a soft surface to avoid damage to the case.
2. Using a T8 Torx driver, loosen the long screw on the front side of the PowerBook expansion bay half a turn. This is the screw directly under the release mechanism.
3. Remove and reseat the battery several times, ensuring that the battery locks into place.
4. Repeat if needed for the other expansion bay.

Replacement Caution: It is not necessary to remove any of these screws during this procedure. If you do remove them, the two long screws go in the outside holes on the front edge. Installing them in any of the other screw holes could cause the screws to push through the plastics or cause the plastic to dimple.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

ClarisWorks 5.0v2 Updater: Read Me for Macintosh

ClarisWorks 5.0v2 Update was released on June 24, 1998. It requires U.S. English 5.0v1 of ClarisWorks for Macintosh or Windows and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates .

Description: ClarisWorks 5.0v2 Updater will upgrade U.S. versions 5.0v1 to the current U.S. release, 5.0v2. This Updater WILL NOT update any international versions of ClarisWorks. ClarisWorks 5.0v2 is a maintenance release which addresses 23 bugs on both platforms. On Mac OS, the ClarisWorks application, HTML translator, and HTML config assistant are updated. On Windows, the application and HTML filter are updated. Please see the updated "Read Me" document included with this software for a complete list of issues addressed with this update.

This update includes the following:
* (Mac OS) In 5.0v1, the Microsoft Word 6 translator ("MS Word 6 Mac [MacLink]") would not appear in the list of available translators in the Open or Save As dialog boxes if Microsoft Word 6 was installed. It will now appear correctly.
* (Mac OS & Windows) Spaces that have been formatted with the underline style will now print correctly.

January 30, 1999: Apple released AppleWorks 5.0.3 Updater which updates U.S. versions of ClarisWorks 5.0v1 and 5.0v2 for Macintosh to the current U.S. release of AppleWorks 5.0.3 for Macintosh.
This article has been archived and is no longer updated by Apple.
ClarisWorks 5.0v2 Updater Read Me

Thank you for investing in Claris software. From time to time, we produce maintenance releases of our software. We'll add minor functionality, correct defects, or respond to customer requests. We'd like to make it as convenient as possible for you to obtain these new versions and enjoy their benefits.

Updates, in contrast to upgrades, contain few changes from the previous version. Instead of distributing the full, revised application, we can provide just the files necessary to incorporate the new functionality and fixes. When you run the accompanying Updater, it will combine your original ClarisWorks 5.0v1 files with the new changes to create new ClarisWorks 5.0v2 files.

The following files are updated with this updater:

1. ClarisWorks 5.0v1 application
2. Read Me - ClarisWorks 5.0 - document that describes general release information
3. HTML Translator (located in the Claris Translators folder)
4. HTMLConfig Assistant (located in the ClarisWorks Assistants folder)

This document provides information about:
I. Installing the ClarisWorks 5.0v2 Update
II. Problems and Issues Addressed in 5.0v2

I. INSTALLING THE CLARISWORKS 5.0v2 UPDATE

Before running the updater make sure all of your computer's System software extensions are turned off. To do this:

1. Save all open files and quit all of the programs running on your computer.
2. Hold down the Shift key on your keyboard.
3. Choose Restart from the Special menu.
4. Do not release the Shift key until the words "Welcome to Macintosh. Extensions off." appear on your screen.

IMPORTANT
Please note that if you have renamed your ClarisWorks application file to something other than 'ClarisWorks', this updater will not be able to update a file used to change Internet settings. Please make sure that your ClarisWorks 5.0v1 application file is named 'ClarisWorks' to ensure all files are updated correctly.

The ClarisWorks 5.0v2 Updater will upgrade U.S. versions of 5.0v1 to the current U.S. release, 5.0v2. This Updater WILL NOT update any international versions of ClarisWorks.

To update the ClarisWorks 5.0v1 product currently installed on your computer:

1. Double-click the "ClarisWorks 5.0v2 Updater" installer icon.
2. Read the Claris splash screen and click OK.
3. The ClarisWorks 5.0v2 installer will install the updater file on your hard disk and automatically launch it. The updater will search your hard disk for eligible files for updating. Note: Only ClarisWorks 5.0v1 may be updated using this updater. Earlier versions are not supported

by this updater.
4. Click Update. The updater will begin updating the selected 5.0v1 application. Once the updater is finished, the original 5.0v1 file is moved to the trash. Then click OK to quit and you can begin using the updated version of ClarisWorks.

II. Problems and Issues Addressed in 5.0v2

The ClarisWorks 5.0v2 Update corrects several minor problems with the initial release of ClarisWorks 5.0.

- In 5.0v1, the Microsoft Word 6 translator ("MS Word 6 Mac MacLink would not appear in the list of available translators in the Open or Save As dialog boxes if Microsoft Word 6 was installed on the computer. It will now appear in all cases.
- Spaces that have been formatted with the underline style will now print correctly in all cases.
- Curly quotes now appear correctly after section and page breaks.
- Outline styles can now be imported correctly when overwriting an existing style.
- Custom indents can now be applied correctly when editing an outline style.
- In 5.0v1, using the Print button from the Button Bar to print a spreadsheet would cause the cell grid, row, and column headings to be printed even if these options were turned off in the Display dialog box. Using the Print button now prints the file correctly as it looks on the screen.
- Documents can now be saved when ClarisWorks is run from a locked or read-only volume.
- When using a third-party Word Services-compatible spell checker, corrections are no longer misapplied to text on the previous line.
- 5.0v2 corrects a conflict with Spell Catcher which caused the scroll bars to disappear and the document unable to edit after Spell Catcher was run.
- Double-clicking on a file icon, when there are two similarly named files in the same folder, now opens the correct file.
- In 5.0v1, repeated copying and pasting of graphics within word processing files would sometimes result in insufficient memory alerts. This is corrected in 5.0v2.
- The Register ClarisWorks Assistant no longer runs automatically when the application is first launched.
- The combined 68K/PowerPC ("Fat") version of the application requires about 450K less memory than it did in 5.0v1.
- In 5.0v1 setting page numbering to begin with 0 would in some cases cause improper page ranges to be printed, and it was not possible to start a print job with the page numbered 1. 5.0v2 corrects these problems.

Mention of third party products and companies is for informational purposes only and constitutes neither an endorsement nor a recommendation.

ClarisWorks
ClarisWorks is being renamed AppleWorks and will be bundled with the forthcoming iMac computer.

LaserWriter 12/640 PS: IP Address Reads 0.0.0.0

My LaserWriter 12/640 PS printer's Startup Page reads that it has an IP address of 0.0.0.0 even though I've configured it via ping to have an IP address, and I can print to it over TCP/IP. Why does the Startup Page not show an IP address?
This article has been archived and is no longer updated by Apple.
If you configured your Laserwriter 12/640 PS printer's IP address with ping, RARP, or BOOTP and you can print to the printer through TCP/IP, the Startup Page will always report an IP address of 0.0.0.0. If the IP address is set using the Apple Printer Utility or telnet, the address will appear on the Startup Page and Configuration Page. However, the printer will not save configuration changes if the Communication switch is in the Reset (out) position, or when a serial cable is connected to its LocalTalk port.

More in-depth information follows, based on actual observations of the LaserWriter 12/640 PS printer:

Initial Factory Setup
TCP/IP default setting is enabled with the IP address set to 0.0.0.0.

When the LaserWriter 12/640 PS first starts up, it issues a RARP request and a BOOTP request every 5 seconds for approximately one minute.

If the printer receives no responses to these initial requests, it will not respond to ICMP echo or ARP requests and cannot be printed to with TCP/IP. However, the printer will accept an ICMP echo request when the destination Ethernet address matches its Ethernet address (ping assignment) - the printer will adopt the destination IP address as its IP address, and then will respond to ARP and echo requests and accept lpd print jobs. It will also report its new IP address through utilities and on the Configuration Page (but not the Startup Page).

Behavior On Restarting (TCP Port Enabled)
What happens depends on how the IP address was previously set:

- Initial factory setup (or reset via a utility to 0.0.0.0): described above.
- IP address previously set through ping assignment: the Startup Page shows the IP address as 0.0.0.0. The pinter issues RARP and BOOTP requests and will take a new IP address if a response is received. If no response is received, the IP address previously set through the ping assignment will be used.
- IP address previously set through RARP or BOOTP: the Startup Page shows the IP address as 0.0.0.0. The printer transmits RARP and BOOTP requests and will take a new IP address if a response is received. If no response is received, the IP address previously obtained through RARP or BOOTP is used.
- IP address set through Apple Printer Utility, Apple LaserWriter Utility for Windows, or telnet: the Startup Page shows the IP address as set by the utility. The printer will not transmit RARP or BOOTP requests. The IP address can not be changed through ping assignment. ICMP echo requests with a different target IP address are ignored.

Behavior On Restarting (TCP/IP Port Disabled)
In all cases the printer does not respond to ARPs or ICMP echo packets, and no packets in the IP protocol suite are transmitted by the printer. All indications are that IP is completely turned off. Whether the IP address is printed on the startup page and reported through the utilities depends on how it had been previously set:

- IP address previously set through ping assignment: the Startup Page shows the IP address as 0.0.0.0. Utilities show the address as the value previously set through ping assignment.
- IP address previously set through RARP or BOOTP: the Startup Page shows the IP address as 0.0.0.0. Utilities show the address as the value previously set.
- IP address set through Apple Printer Utility, Apple LaserWriter Utility for Windows, or telnet: The Startup Page and utilities show the IP address as set via the utility.

Behavior With DHCP
With a Windows NT server, per Microsoft's documentation, the DHCP implementation in version 3.5.1 Service Pack 5 only responds to DHCP requests and, BOOTP requests are discarded. If you are using DHCP on Windows NT version 3.5.1 Service Pack 5, devices using BOOTP will have to be assigned a fixed IP address. Microsoft indicates a subsequent version supports BOOTP, and should let IP addresses be picked from a range of addresses. In both cases, the address would be given an "infinite lease".

The RFC 1534 document describes how a compliant DHCP server should support BOOTP clients as described below:

> The format of DHCP messages is defined to be compatible with the format of BOOTP messages, so that existing BOOTP clients can interoperate with DHCP servers. Any message received by a DHCP server that includes a 'DHCP message type' (51) option is assumed to have been sent by a DHCP client. Messages without the DHCP Message Type option are assumed to have been sent by a BOOTP client. Support of BOOTP clients by a DHCP server is optional at the discretion of the local system administrator. If a DHCP server that is not configured to support BOOTP clients receives a BOOTREQUEST message from a BOOTP client, that server silently discards the BOOTREQUEST message.

If a DHCP server is configured to support BOOTP clients, it may be configured to supply static addresses, automatic addresses or both. Static addresses are those that have been previously assigned by a system administrator and are stored in a database available to the DHCP server. Automatic addresses are those selected by the DHCP server from its pool of unassigned addresses.

Since BOOTP clients may not be prepared to receive automatic addresses, the decision to allow a DHCP server to return automatic addresses must be under the control of the system administrator. If a DHCP server supports supplying automatic addresses to BOOTP clients, this feature must be configurable and the feature must default to off. Enabling of the feature must be the result of an active decision by the system administrator.

If a DHCP server returns a automatic address, the BOOTP client will not be aware of the DHCP lease mechanism for network address assignment. Thus the DHCP server must assign an infinite lease duration for automatic addresses assigned to BOOTP clients. Such network addresses cannot be automatically reassigned by the server. The local system administrator may choose to manually release network addresses assigned to BOOTP clients.

A DHCP server that supports BOOTP clients MUST interact with BOOTP clients according to the BOOTP protocol. The server MUST formulate a BOOTP BOOTREPLY message rather than a DHCP DHCPOFFER message (i.e., the server MUST NOT include the 'DHCP message type' option and MUST NOT exceed the size limit for BOOTREPLY messages). The server marks a binding for a BOOTP client as BOUND after sending the BOOTP BOOTREPLY, as a non-DHCP client will not send a DHCPREQUEST message nor will that client expect a DHCPACK message.

DHCP servers MAY send any DHCP Options to a BOOTP client as allowed by the "DHCP Options and BOOTP Vendor Extensions" RFC [2].

The BOOTP request packets issued by LaserWriter 12/640 PS printer correctly follow the BOOTP specification.

LaserWriter 12/640 PS: Stealing an IP Address

Can a LaserWriter 12/640 PS steal and attempt to use an IP address assigned to another node? I've heard one unconfirmed report suggesting this occurred, that a LaserWriter 12/640 PS acquired the address of another device, even though it was never assigned an IP address nor was being printed to over IP.
This article has been archived and is no longer updated by Apple.
What you describe could occur with a LaserWriter 16/600 PS with a pre-v3.0 IOP ROM which had a known bug. The LaserWriter 16/600 PS failed to check the BOOTP transaction ID and incorrectly accepted a broadcast BOOTP reply intended for another device, which should not occur to a LaserWriter 12/640 PS. The LaserWriter 12/640 PS was tested and confirmed to properly reject broadcast BOOTP packets not intended for itself.

Assuming there are no BOOTP or RARP servers on the network, an address could be acquired through ping assignment, but only a correct assignment because the LaserWriter 12/640 PS will not accept IP addresses through broadcast multicast ICMP echo requests.

It is possible a corrupt ARP table could cause an ICMP request to be generated that would cause the printer to accept the address. However, in order for this to occur the ARP table would have to associate the printer's correct 48-bit Ethernet address with the to-be-stolen IP address of another device which seems unlikely.

Based on the known characteristics of the LaserWriter 12/640 PS, Apple believes it is far more probable that the printer was inadvertently assigned an incorrect IP address through any method specified in the manual without the administrators knowledge.

Should the LaserWriter 12/640 PS retain IP addresses obtained through BOOTP or RARP when restarted? For more information please refer to Tech Info Library article #22217: "**LaserWriter 12/640 PS: IP Address Reads 0.0.0.0.**"

One way the printer could be perceived to steal IP addressees is as follows:

1. The administrator assigns an IP address to the printer through BOOTP or RARP.
2. The printer is restarted and stores the address in non-volatile memory.
3. The administrator decides to remove the printer from IP by removing the printer from the BOOTP or RARP server.

Mac OS: About the Euro Currency Symbol

This document describes Apple's support of the euro glyph, including answers to the following questions:

1. How do I type the euro symbol?
2. What character does it replace in the character set?
3. Which fonts have the euro glyph?
4. How do I print the euro glyph?
5. How is it encoded?
6. Where can I find more detailed, in-depth information?

This article has been archived and is no longer updated by Apple.

Figure 1 The euro symbol (glyph)

On 2001-01-01 twelve member states of the European Union replaced their national currencies with a single European currency called the euro. The European Commission, the EU's primary executive body, has created a symbol for the new currency. It is used to designate the euro in the same way as dollar, pound, and yen symbols are used. Because the euro symbol (or glyph) is not a part of the character sets used by computers and printers around the world, equipment manufacturers must revise or update their products to accommodate the new symbol's use.

Apple introduced support for the euro glyph in Mac OS 8.5. This, and future versions of the OS, including localizations for nations that are not part of the euro zone, support the euro glyph as well as any existing currency characters.

Question 1: How do I type the euro symbol?

Answer: See technical document 61586: "**Mac OS: How to Type the Euro Glyph (€)**".

Question 2: What character does it replace in the character set?

Answer: The international currency symbol. (See Figure 2 below.)

Figure 2: The international currency symbol.

Question 3: Which fonts have the euro glyph?

Answer: Under Mac OS 8.5:

- Apple Chancery
- Capitals
- Charcoal
- Chicago
- Courier
- Gadget
- Geneva
- Helvetica
- Hoefler Text
- Monaco
- New York
- Palatino
- Sand
- Skia
- Symbol
- Techno
- Textile
- Times

Question 4: How do I print the euro glyph?

Answer: When an application prints using the euro glyph in a given font, LaserWriter 8.6 switches to the Symbol font and prints the glyph in that font. PostScript Level 3 printers have the euro glyph in the Symbol font, and therefore present no special problems.

Printers having interpreters prior to Level 3 do not contain the euro glyph and to compensate, LaserWriter 8.6 downloads a euro glyph character and maps it into the resident Symbol font.

In either case, LaserWriter driver 8.6 (part of Mac OS 8.5) is required to print the euro glyph.

Question 5: How is it encoded?

Answer: The euro character is encoded in the Unicode Standard as U+20AC EURO SIGN, MacRoman Encoding decimal 219, hex 0xDB. For Symbol, the glyph has been added at Option-t (MacRoman Encoding decimal 160, hex 0xA0, previously unused).

Question 6: Where can I find more detailed, in-depth information?

Answer: For detailed and in-depth information about Apple's support for the euro, see Tech Notes 1140 and 1143. The following document can help you find the Tech Notes mentioned here: 24493: "**Apple Tech Notes: What They Are, Where To Find Them**"

For more information about the euro, consult the European Union's Web site at: **http://europa.eu.int/euro/**.

ClarisWorks 5.0 for Windows Updater: Installer Error

While using the ClarisWorks 5.0v2 Updater for Windows, I got the following error message, "Patch Error - Old File not found. However, a file of the same name was found. No update done since file contents do not match." What's going on?
This article has been archived and is no longer updated by Apple.
Here is what's happening. The updater asks you to locate the ClarisWorks application (executable) and later the HTML filter (html.f32). In the latter case, it chooses a default location, but gives you the option to click No. Clicking No causes the updater to search for an alternate location. Eventually you may find that you are presented with a standard looking Open dialog box, the updater still looking for the HTML filter. The Open button is available, even though the updater has most likely arrived at a directory that does not contain the filter, like the ClarisWorks application folder.

This scenario can be compounded in situations where you have multiple ClarisWorks installations (including previous versions of ClarisWorks), or have moved or renamed any ClarisWorks components or directories. If you click Open with the wrong directory chosen, the patch error will result. In such cases, the application is updated but not the filter.

The best remedy to this is make sure that the selected folder has an html.f32 file in it before clicking Open or OK. If you are unsure of the location of the HTML filter, it is recommended that you use Windows Find to locate it, make a note of its location, and then run the updater.

Power Macintosh G3: Network Assistant & Printer Share

After installing Network Assistant on my Power Macintosh G3-based computer, I get the following message when I try to enable printer sharing for my printer, "You must install the Printer Share extension to share you printer. Use the installer on the disks that came with your printer to install the software you need." What is wrong?

This article has been archived and is no longer updated by Apple.

Apple has discovered an issue with Network Assistant 2.0 and 3.01 and print sharing on Power Macintosh G3-based computers running Mac OS 8.1 with System Enabler 777 (v.1.0). If the Network Assistant Startup extension loads before the Printer Share extension on some Power Macintosh G3-based computers, they will not enable printer sharing.

Workaround

Move the Network Assistant Startup extension out of the Extensions folder to the System Folder. The Network Assistant Startup extension will then load after the Printer Share extension.

Note: This workaround will also eliminate the following false error messages generated by the combination of Network Assistant 2.0.x or 3.0.x with either of the following third party programs:

- FaxSTF: message "STFinit sys ext had an error loading the ACD1.drvr"
- InterAxcess/PrinterAxcess: message "This is an illegal duplicate copy of TCPAxcess. Please purchase more copies of TCPAxcess."

Power Macintosh G3: Locating Iomega Zip Driver on CD

This article explains where to find the Iomega Zip Driver on the Power Macintosh G3 Desktop and Minitower Software Install or Restore CD. This article has been archived and is no longer updated by Apple.
In the past, Power Macintosh G3 system software CD-ROM discs included the Iomega Driver extension in the Iomega folder on the compact disc. With the roll-in of Mac OS 8.1 into the Power Macintosh G3 product line, this extension was only installed into the System Folder's Extensions folder by the system software installer.

In August, 1998, Apple began shipping a newer Power Macintosh G3 system software CD-ROM disc for Power Macintosh G3 Desktop and Minitower Computers which includes the Iomega Driver extension.

The Software Install or Restore compact disc is titled: *Power Macintosh G3 Desktop and Minitower Computers Software Install or Restore*

The version and part number for this compact disc is listed as:

© 1998 Apple Computer, Inc.
SSW Version 8.1
CD Version 1.0
691-2008-A

If you would like to install just the Iomega Driver extension from the Power Macintosh G3 system software CD-ROM disc to the System Folder on the hard drive, it is located in the following folder path:

Power Macintosh G3->Full Install Pieces->Software Installers->System Software->Power Macintosh G3 Update->Parts->Iomega Driver

iMac: Transferring Files Modem to Modem

This article describes how to transfer files between two computers connected to each other via modem.
This article has been archived and is no longer updated by Apple.
Yes, you can connect two modems with a phone cable and transfer data, however, Ethernet is a much better way to transfer data if your older Macintosh is Ethernet capable.

Here are the steps to transfer files via modem using a data communications terminal program, in this case AppleWorks 5. It is also helpful to use a file compression program to create one single file for simplicity when sending. Here are the steps:

1. Connect both modems with a standard telephone cable.

2. In AppleWorks, open a new Communications document.

3. For both computers, under the Settings menu set the Connections Settings for:
Method: Serial Tool
Baud Rate: 57600
Parity: None
Data Bits: 8
Stop Bits: 1
Handshake DTR & CTS
Current Port : Internal (or appropriate port)

4. For both computers, under the Settings menu set or leave the default File Transfer Settings as:
Protocol: XMODEM Tool
Method: MacBinary
Transfer Options: Standard

5. On the receiving computer running AppleWorks, pull down the Edit menu and select Preferences. In the Topic for Communications click Receiving Folder and select a receiving folder.

6. Select Open Connection from the Session menu (this will let you type modem AT commands).

7. On the sending computer, type:
ATX3D

8. On the receiving computer type:
ATA

9. The modems should begin to negotiate and indicate a connection speed.

10. Once the modems are connected, select Send File from the Session menu on the sending computer.

11. Click the Send button from the Session menu and select the document's StuffIt archive file.

12. On the receiving computer, select Receive File from the Session menu.

The computers should start to send and receive the file via XMODEM.

iMac: Game Controller Support

I just installed a new game on my iMac and it does not work with the USB mouse.

This article has been archived and is no longer updated by Apple.

The iMac should support the game using the Apple USB mouse or a game controller as long as you have the proper system software extensions installed. Depending upon the version of the Mac OS installed on your iMac, you may need to download the current version of Apple Game Sprockets. You may search for the current version on the Apple Software Updates Web site at http://www.apple.com/swupdates.

iMac: Editing AOL Modem Initialization String for 33.6 Kbps Connection

This article describes how to modify an America Online (AOL) modem connection script to connect at slower speed such as 33.6 kilobits per second (Kbps).
This article has been archived and is no longer updated by Apple.
To modify a modem profile in AOL follow the steps outlined below:

1. Select the Setup button from the Sign On window.
2. Select the Expert Setup button from the AOL Setup window.
3. Select the location you wish to edit and select the Edit button.
4. Select the Modem Options button in the Edit Location window.
5. Select the Advanced Settings button in the Modem Options window.
6. In the Advanced Settings window, change the name of the modem to something you will be able to identify at a later time, for example, iMac Internal 56K (33.6 kbps).
7. The box labeled Configuration should contain the following string: "Q0E0V1X4S95=1"
   To force the modem to use V.34 (33.6 kbps maximum speed), add "+MS=11,1" to the end of the configuration string. The result should look like:
   "Q0E0V1X4S95=1+MS=11,1"

If you have never made a successful connection to America Online, the steps above will vary somewhat. Enter the Expert Setup mode and locate the button that allows modem settings to be edited.

Zip Drive: Reinstalling Software

This article explains how to reinstall Zip software after reinstalling System Software.
This article has been archived and is no longer updated by Apple.
After initializing the hard disk and reinstalling the System Software, the internal Zip drive no longer works. What happened?

Reinstalling the Zip software for your computer is a separate process. Here are the steps:

1. Drag the Iomega Tools folder from your Apple Macintosh CD to your hard drive. (The Iomega Tools folder is in the CD Extras folder on the CD.)

2. Drag both the Iomega Drive Options control panel and the Iomega Drive extension to the System Folder on your hard drive. You will be asked whether you would like to put these files in the appropriate locations. Click "OK".

3. Restart your computer.

MacDNS: Incoming Requests With Additional Domain Name

This article explains why an additional domain name may appear on incoming requests in the MacDNS log file.
This article has been archived and is no longer updated by Apple.
Incoming requests in the MacDNS log file may appear with the local domain name tacked on at the end (for example, "www.apple.com.mydomain.com".) This usually occurs due to the way the client application and TCP/IP are configured on the client end. If you try to look up a name that is not terminated with a dot, the client assumes that the name is not a fully-qualified domain name and appends the default domain name to the end before sending off the request.

If your DNS client is using MacTCP, try setting '.' as the default domain name; on the client machine, type a period in the box to the left of where you entered the IP address of the DNS server.

AppleShare IP: Setting Up TCP/IP On Standalone Network

This article discusses how to set up TCP/IP on a standalone network.
This article has been archived and is no longer updated by Apple.
First, make sure that Open Transport 1.1.2 and AppleShare Client 3.7 software are installed on each client in your network.

If you are planning to connect your network to the Internet, you must obtain your domain name and network address from an official internet registry. If you are not planning to connect your network to the Internet, you can still set up TCP/IP on your network without obtaining an official address. Note that if you plan on connecting to the Internet in the future, you would then need to change the configuration of your entire network, so you may want to go ahead and get an address assigned.

If you have determined that none of your computers will have external IP connectivity then you can assign IP address from the following blocks without consulting with any Internet registry:

10.0.0.0 - 10.255.255.255 (a Class A Network - 24 bits of address space)
172.16.0.0 - 172.31.255.255 (16 contiguous Class B Networks - 20 bits of address space)
192.168.0.0 - 192.168.255.255 (255 contiguous Class C Networks - 16 bits of address space).

[source: RFC 1597, "Address Allocation for Private Internets"]

An address with all host bits set to 0 refers to the network itself. An address with all host bits set to 255 is a broadcast address and goes to all hosts on the network.

Example - 192.168.0.0 refers to the Class C network 192.168.0. The address 192.168.0.255 is the broadcast address for the Class C network 192.168.0. Addresses 192.168.0.1 through 192.168.0.254 are addresses of individual computers on network 192.168.0.

Localtalk networks and hosts connected to your network through Apple Remote Access cannot carry TCP/IP traffic, only AppleTalk. If you want hosts using Localtalk to have TCP/IP access, it must be done by encapsulating TCP/IP within AppleTalk. This requires the use of a DDP-IP gateway, also known as a MacIP server. Apple IP Gateway is an example of a MacIP server.

AppleShare: Mounted Volumes Limits

This article explains how many volumes a Mac OS-based AppleShare client or an AppleShare server may safely mount and operate.
This article has been archived and is no longer updated by Apple.

AppleShare Clients

With pre-3.7 Clients, AppleShare is limited by AppleTalk to 20 server connections. You can mount more than 20 volumes, but you can connect with only 20 different servers.

With AppleShare Client 3.7 you can connect to about 250 different servers over TCP/IP and 20 over AppleTalk. The practical limit here is memory in the System heap. Each connection allocates about 10k of data structures for TCP/IP, or 4k for AppleTalk.

One of the causes of the long "pauses with the network arrows" is that the client must poll each mounted volume to see if the modification date has changed. The Client sends a GetVolParms command to each mounted volume every 10 seconds. The more volumes you have mounted the more polling takes place. Usually this is a very quick operation, but response time may vary.

AppleShare IP 5.0 Servers and the 3.7 Client have fixed this problem by adding Server Notifications. The 3.7 Client does not poll the Server. Instead, the Server notifies the Client when a volume has changed. This is one of the new things in AFP 2.2.

AppleShare Servers

In the case of a server mounting volumes from other servers, the limit is the same as above, although for best performance avoid keeping remote volumes mounted.

The maximum number of volumes is 50 in all versions since AppleShare 3.0. The maximum number of items that can be shared on these 50 volumes is 100 in AppleShare 4.2.1, AppleShare IP 5.0.x, and AppleShare IP 6.x. In previous versions of AppleShare it was 50.

Mac OS 8: Late Breaking Information

This article includes late-breaking information regarding Mac OS 8 (as of 1997-07-06).
This article has been archived and is no longer updated by Apple.

Installer Alias does not work to the Geoport/Express Modems Installer on the Mac OS 8 CD
The error: "The alias Installer could not be opened because the original item cannot be found" will appear if the icon is opened.

Workaround: The correct installer application can be found two folders down in: Net Install: Apple Telecom - Disk 1. Selecting the Installer alias, and choosing Get Info from the File menu will display the correct path.

Cannot Boot from Mac OS 8 CD When AppleTalk is Off
Some customers have reported that they are unable to boot from the Mac OS 8 Install CD. During the startup process, a dialog appears with the following message: 'Sorry, a system error has occurred. Bus Error Type 11. Restart with Shift key held down.' This issue is currently under investigation.

Possible Workarounds (Not all of them may be necessary):

- Make sure the computer is running from the startup disk. Activate AppleTalk (in the Chooser for classic networking, or in the AppleTalk control panel for Open Transport networking). With the Mac OS 8 CD in the CD-ROM drive, restart the computer while holding down the 'c' key.
- With the Mac OS 8 CD in the CD-ROM drive, startup your computer, while pressing the letter 'c' (or Command-Option-Shft-Delete if appropriate). When the Happy Macintosh icon appears, release all keys and hold down the Shift key until the screen appears with the 'extensions disabled' message.
- Using the Mac OS 8 CD, create a startup Disk Tools disk. To make a Disk Tools disk, open the Disk Tools folder on the Mac OS 8 CD, then open the Make Disk Tools floppies application. When you startup from the Disk Tools disk, you will then be able to run the Mac OS 8 Installer from the CD. (This will only work with Apple CD-ROM drives).
- Use the Extensions Manager to select a minimum (base) set of the Mac OS extensions. Boot from the hard disk and install from the Mac OS 8 CD. If the installer finds any issues with the hard disk, it will not be able to correct them.
- Clear the Parameter RAM (PRAM). After doing this, restart holding down the 'c' key to start up from the Mac OS 8 Install CD.

No Compatibility Issues With Mac OS 8 and Personal Web Sharing
The Read Me for Personal Web Sharing (posted separately on the Internet) incorrectly states that there are compatibility issues, and this misinformation has been posted on other web sites. There are no known incompatibilities with Mac OS 8 and Personal Web Sharing. There is no need to turn off Virtual Memory (VM), nor is there an issue with the PCI Enet driver.

Intermittent issue Copying a Large Number of Files in Low Memory Situation
Apple has identified an intermittent issue with Mac OS 8 relating to copying large number of files between volumes when memory is low. If memory is low and a very large copy is performed between two local volumes or a local volume and a shared volume, all items may not be copied correctly and no indication is given. The size of the copy necessary to produce the bug is related to how little memory remains when the copy is started but the issue most often occurs with copies of more than several thousand items. Apple is working on a fix for this issue.

Workaround: Make sure several megabytes of memory is available before starting a large copy and copy fewer files at a time. To verify that the issue has not occurred, compare the number of items in the result with that in the source. Select the source and result and select Get Info from the File menu. Compare the number of items shown in the Size field. If the number are the same, the copy finished correctly. Note that the total sizes may differ depending on the size of the source and destination volumes. Different total sizes do not indicate an issue with the copy.

Starting a 68040 computers from a CD-ROM using the c key depressed or "command-option-shift-delete" does not work when the SCSI-ID is 5

Typically, to start up using a bootable CD, holding down the "c" key or"command-option-shift-delete" will force the computer to ignore the default startup volume, and boot from the CD in the CD-ROM drive. This will not work on 68K computers if your CDdrive is set to SCSI-ID 5. The computer will chime, and display the sad Mac, which usually denotes a hardware issue.

Workaround: Select the CD as the startup disk in the Startup control panel or set the SCSI-ID to anything but 5 will work around this issue.
Note: internal CD drives shipped from Apple are not set to SCSI-ID 5.

In a pop-up window, selecting make alias or duplicate from the contextual menu (Control-click) will cause a system crash
Workaround: Selecting "make alias" from the menu, and using the contextual menu when not in a pop-up window work correctly. Option-dragging the file also works correctly.

Duplication of a folder with more than 20 items on a remote server can unexpectedly fail
When a folder with more than 20 items in it is duplicated, sometimes the copy will not complete, and no indication is given to the user. The copy failure can depend on the size of the files, and the order they are copied (which is dependent on the B-tree). The issue results in the process being

put to sleep, and thus neither computer is doing anything. Neither computer inoperative, and the copy can be terminated from the workstation by clicking the Stop button.

Workaround: Workarounds include copying the folder to another volume and back again; copying less than 20 files at a time; compressing the files into one large file, duplicating, and decompressing them again. Copying the folder to another volume will always work, the issue only occurs when duplicating some folders on another computer over a network.

MBDF virus infection can result in visual defects when the "System-wide platinum appearance" is turned off
On a virus infected computer with the System-wide platinum appearance check box unchecked in the Appearance control panel, visual defects such as issues in menus, menu items that were white turning grey when the mouse tracks over them. This indicates that the system has probably been infected with the MBDF virus. This virus causes no issues other than this color discrepancy, but should be removed by a virus removal utility.

Workaround: Use a virus utility to disinfect your computer.

Adobe Type Manager (ATM) v 4.0.2 Installation Instructions
The latest version of Adobe Type Manager, version 4.0.2, is included with Mac OS 8. Previous versions of ATM did not load properly when running the new QuickDraw GX Graphics extension. ATM version 4.0.2 addresses this issue.

Note: This version of ATM does not work with ATM Deluxe version 4.0. If you are running ATM Deluxe, do not install this updated version ATM 4.0.2.

To install ATM 4.02, you need to run the QuickDraw GX Installer located in the folder QuickDraw GX in the Software Installers folder. Here are the steps:

1. Double-click Install QuickDraw GX
2. From the main installer screen click on the Easy Install pop-up menu.
3. Select Custom Install.
4. Select ATM for QuickDraw GX.
5. Click the Install button.
6. At the end of the installation you will need to restart your computer.

Incorrect Version of Dial-up Application for MacLink Plus 9.0
The incorrect version of the automatic dial-up registration application for MacLinkPlus 9.0 was included on the Mac OS 8 CD.The International version was included instead of the U.S. version. U.S. customers who want to register MacLinkPlus 9.0 electronically can do so by visiting DataViz at: http://www.dataviz.com/register . Customers can also register by printing out the registration form, and mailing it to DataViz using the address found in the 'Contacting DataViz' file.

Mac OS Runtime for Java version 1.5 Now Available
Apple has released version 1.5 of the Mac OS Runtime for Java. This is a major update that includes performance enhancement technology that can run your Java applets and applications up to 10 times faster.

Now Utilities Not Fully Compatible with Mac OS 8
Now Software is evaluating the situation and will announce their plans in the near future. In the meantime, they recommend that you do not install Now Utilities with Mac OS 8 or if you do, that you do so at your own risk.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

- The Knowledge Base article titled "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

This article can help you locate the software update mentioned here:

LaserWriter 12/640 PS: Cannot change sleep mode timing

I have noticed that my LaserWriter 12/640 PS printer powers itself down into a sleep mode after every print job. It occurs about 5-10 seconds after the job finishes. I would like to change that. The LaserWriter Printer Utility software does not allow me to change the "sleep setting" on my LaserWriter 12/640 PS. I am able to change it on other Apple laser printers; how can I change the sleep setting on my LaserWriter 12/640 PS?
This article has been archived and is no longer updated by Apple.
The LaserWriter 12/640 PS engine (the fuser, scanner and other internal parts, not including the main controller board) goes to sleep 10 seconds after the completion of a job. This is a low-level sleep feature and is a built-in, static characteristic of that print engine. It cannot be changed by the Apple Printer Utility or by downloading PostScript code.

Note: The LaserWriter 12/640 PS is Energy Star compliant and is registered with the US Environmental Protection Agency (EPA) as such.

Mac OS: "There Is A Problem With The Disk..." Error Message

This article discusses the following error message: "There is a problem with the disk <disk name>. Some information may have been lost. Check any recently-used files for data loss, and use a disk-repair program on the disk."
This article has been archived and is no longer updated by Apple.
This message is displayed when an error is encountered writing data from the disk cache to the hard disk, indicating an issue with the disk named in the message. You should run Apple Disk First Aid or another drive utility application to address this issue.

Since this error does not occur when data is saved but when the disk cache is written to the hard disk, the operating system displays the message and not the application that was used to edit the data.

Mac OS 8: New Icons in Finder Windows

After installing Mac OS 8, I have noticed icons to the left of the "number of items" and "amount of disk space available" at the top of a window. What are these for and why do they change?

This article has been archived and is no longer updated by Apple.
The icons you describe are related to the View Options available under the View Menu in the Finder, shown in Figure 1. These options are also available in later versions of the Mac OS.

Figure 1 View Options Window

Each window you open in the Finder can have a separate view set, which is why one window may look different than another. When a window is set in Icon Mode, the view can have three options for the arrangement of icons:

- **None** has no specific arrangement, no little icon at the top of the window as shown in Figure 2.

Figure 2 None View

- **Always Snap to Grid** always aligns the icons neeatly, shows the small "grid" icon as shown in Figure 3.

Figure 3 Always Snap To Grid View

- **Keep Arranged** shows the four folder icons as shown in Figure 4.

Figure 4 Keep Arranged Icon View

The "Keep Arranged" choice has the following options:

- By Name
- By Date Modified
- By Date Created
- By Size
- By Kind
- By Label

Additionally, the View Options window allows you to choose between large or small icons.

Power Macintosh G3: Read Me

This article contains the Read Me document for the Power Macintosh G3.

This article has been archived and is no longer updated by Apple.

Important Information For Your Power Macintosh G3 Computer

This document provides information about your Power Macintosh G3 computer that supplements the information in the Setting Up Your Power Macintosh manual. Read this document for information about known conditions with this release and possible solutions. Also read the About Mac OS 8 document located in the Mac OS Read Me Files folder on your hard drive. For up-to-date news and compatibility information, please see the Apple Support web site at http://www.apple.com/support/

Notes about installing additional memory, PCI cards, or SCSI devices

- Important safety information
  Please read your manual, Setting Up Your Power Macintosh, for important installation and safety information before attempting any equipment installation. This manual may be downloaded in PDF format from http://www.info.apple.com/manuals/manuals.taf . Pay particular attention to the chapters Connecting Additional Equipment and Installing PCI Expansion Cards, Additional Memory, and Internal Storage Devices.
- Connecting additional SCSI devices
  One of the most common mistakes made when installing SCSI devices is incorrect termination. Please refer to the manual chapter Installing PCI Expansion Cards, Additional Memory, and Internal Storage Devices for information on how to correctly terminate the SCSI bus.
- Removing external SCSI devices
  Never remove an external SCSI device without turning off the power to your computer. Removing an external SCSI device when the computer is powered on may result in the SCSI bus hanging. If this occurs, you must power down the computer to correct the situation.

Notes about features on your Power Macintosh G3

- RAM Disk
  The RAM Disk on the Power Macintosh G3 computer will be reinitialized on every restart or reboot. Any data you have stored on a RAM Disk should be copied to the hard drive before a restart or shutdown. The RAM Disk feature should only be used to store data and applications which will be used between restarts and shutdowns.
- TV Mirroring
  The TV Mirroring feature allows you to record to a VCR or view on a television, what is displayed on the computer monitor connected to the built-in graphics port. This feature is available on Power Macintosh G3 computers with video input and output ports.
  The feature is accessed by using the TV Mirroring Control Strip. For more information on TV Mirroring, refer to the section in the manual on Connecting video equipment for output from the computer.
  When TV Mirroring is turned on, the frequency and resolution of the computer monitor is changed to match that of the television. Because the television frequency is not commonly supported by many computer monitors, the monitor display may become distorted or black. In such a case, it is better to turn off the monitor by deselecting the Leave Monitor On option in the TV Mirroring Control Strip. Since fixed frequency monitors by definition cannot change frequency to match the television, they are automatically turned off, and the Leave Monitor On and Overscan options are made unavailable.
  If you inadvertently turn on TV Mirroring, the feature will automatically turn itself off in 10 seconds unless you select the OK button in the confirmation dialog.
- Video Capture
  Video capture is available on Power Macintosh G3 computers with video input and output ports.
  The video capture feature will work with VM on, but the quality of captured video will improve if VM is turned off. AppleTalk should also be made inactive while capturing to prevent network activity from introducing slight variations in the quality of captured video.
  To achieve the best video quality, the monitor connected to the built-in graphics port should be set to Thousands of Colors and the capture window size should not exceed 320 x 240 pixels. The best compression to use with this computer is Component Video.
  If you have problems capturing video or the captured video looks very pixelated, try reducing the resolution and/or number of colors on the monitor connected to the built-in graphics port. Your computer may not have enough video memory to capture video and display high resolution graphics at the same time. Refer to the Setting Up Your Power Macintosh manual for information on installing more video memory.
  If you have a monitor connected to the built-in graphics port and another monitor connected to a PCI graphics card, then to capture video you must have the video capture window of whichever application you are using completely contained on the monitor connected to the built-in graphics port.
- Sound source selection
  There is a new SoundSource Control Strip which allows you to select the sound source your computer will use. This feature is similar to selecting a sound source (tuner, CD, tape, phono,...) to listen or record, on your home stereo system. Alternately, the sound source on your computer may be selected in the Sound panel in the Monitors & Sound Control Panel.

Notes about compatibility

- Apple PC Compatibility cards
  The Apple PC Compatibility card with 100MHz 586 processor (7 inch card) and 166MHz Pentium processor (12 inch card) are supported using PC Setup 1.6.3 software version or greater. Updates to PC Setup may be downloaded from the Internet at http://www.apple.com/support/
  The Apple PC Compatibility card with 100MHz Pentium processor (12 inch card) is not supported by the Power Macintosh G3 computer.

- QuickTake 150 camera
  The QuickTake 150 camera should be connected to the modem port and not the printer port. The printer port will not reliably communicate with the camera.
  Some of the QuickTake scripts under the Script menu in the Apple PhotoFlash 2.0.1 application may not work.
- Apple Telecom software
  The GeoPort modem is not supported by the Power Macintosh G3 computer.
- QuickTime Conferencing and Apple Media Conferencing
  QuickTime Conferencing and the Apple Media Conferencing application are not supported by the Power Macintosh G3 computer.
- Apple QuickTime Conferencing camera
  The QuickTime Conferencing camera may be used with the Power Macintosh G3 computer with video In/Out ports, by using an RCA to RCA video composite cable along with the cable supplied with the camera. Connect the cable supplied with the camera to the S-Video In port on the computer. On the split end of the cable, connect the power connector to the camera's power port. Instead of connecting the video portion of the split cable to the camera, use an RCA to RCA video composite cable to connect between the camera and an RCA Video In port.
- Apple Video Player and 3rd party video capture hardware
  The Apple Video Player application which comes with your computer is intended to work with Apple video capture hardware. Using Apple Video Player with 3rd party video capture hardware, may not work or result in poor quality video capture. Contact the 3rd party video capture hardware manufacturer to find a compatible video capture application.
- Apple Token Ring card
  The Apple Token Ring PCI card is not supported by the Power Macintosh G3 computer.

Notes about known conditions

- No sound or cannot record from an application
  If you do not hear any sound or are not able to record from an application or system utility such as Alerts in the Monitors & Sound Control Panel, then you may not have the correct sound source selected. Some applications and system utilities require the user to select an appropriate sound source to use. Use the SoundSource Control Strip or the Sound Monitoring Source pop-up menu in the Sound panel of the Monitors & Sound Control Panel. For more information on sound source selection, see the Help Guide in the Monitors & Sound Control Panel.
- Connecting to both LocalTalk and Ethernet
  If you have Ethernet selected in the AppleTalk Control Panel, you should disconnect any LocalTalk cable. A software condition prevents having a LocalTalk cable connected to the computer if the AppleTalk Control Panel is not set to the Modem or Printer port. If you wish to switch between Ethernet and LocalTalk, you must disconnect the LocalTalk cable when you switch to Ethernet.
- Slower performance when printing to a LocalTalk printer
  A software problem may cause your computer to exhibit slow performance while printing over LocalTalk on a high traffic network. During printing, the mouse pointer may appear to move sluggishly.
- Loss of Ethernet after installing new software
  Some software installers will inadvertently replace newer extensions with older versions which are not compatible with this computer. This frequently occurs with the Ethernet (built-in) extension. If Ethernet is unavailable after installing software, check that the Ethernet (built-in) extension is version 2.0 or greater. If it is older, then you will have to reinstall your system software from the System Software CD which came with your computer.
- Booting from the wrong hard drive or device
  If your computer has more than one hard drive and it is booting from the wrong drive, check the setting in the Startup Control Panel. You must select a device in the Startup Control Panel or the computer will select the first device it finds to boot from.
  If you have a bootable CD in the CD-ROM drive and restart, the computer may boot from the CD instead of the device selected in the Startup Control Panel. To get around this condition, restart the computer again, and press the eject button on the CD-ROM drive to eject the CD.

Miscellaneous

- Removing System Software items using the PowerMac G3 Installer
  The Remove feature of the PowerMac G3 installer does not work and should not be used. Instead, the individual pieces you wish to remove must be dragged from the System Folder manually.

Published Date: Feb 20, 2012

Apple Displays Software 1.5.5: Read Me

This article is the Read Me for Apple Displays Software 1.5.5
This article has been archived and is no longer updated by Apple.
Apple Displays Software 1.5.5 was released on November 7, 1997. It requires US System 7.5 or greater running on a 68040 or PowerPC based Mac OS computer. System 7.1.x customers should use AppleVision 1.5.3 or earlier.

Previously known as AppleVision software, this version includes the following changes from AppleVision 1.5.3:

- AppleVision 750 and AppleVision 850 displays were renamed the Apple ColorSync Displays.
- Mac OS compatibility is 7.5 and later.
- Name of the disk set and installation changed to Apple Displays Software.
- DigitalColor Meter changed so magnification and RGB values work on a non-AppleVision monitor.
- The Sound Volume control strip module was added to the disk set.

This software consists of two Disk Copy NDIF (New Disk Image Format) compressed images, which require Disk Copy 6.1 or later to use. Download this software to your hard drive and then double-click it to use it. Disk Copy is available in the Utilities folder in the Apple Software Updates Library.

Disk Copy 6.1 (or later) or Disk Image Mounter 2.1 (or later) from Apple are the recommended applications to access all disk images released by Apple and are the only supported applications to access NDIF disk images.

Information About Your Apple Displays Software

This document contains important reminders and the latest product information.

Installation and usage tips

- Follow the instructions in the manual that came with your monitor to install the Apple Displays software.

Important: If you upgrade your system software, you should reinstall the Apple Displays software.

- For a complete list of files installed by the Apple Displays software installer see the last section of this Read Me.

The Apple Displays software version 1.5.5 can be used by all Apple monitor customers, including ColorSync Displays and other Mutiple Scan monitors. Any references to an AppleVision Display is the same as the Apple ColorSync Display.

- For the latest version of the Apple Displays software, visit the product updates section of Apple's web site (**http://www.apple.com**).
- The Sound control panel installed in the Apple Displays Software Extras folder (inside the Apple Extras folder) is for use with third party (non-Apple) specialized audio hardware. See the documentation that came with your audio hardware to determine if you need to use the Sound control panel.
- The Monitors control panel installed in the Apple Displays Software Extras folder (inside the Apple Extras folder) is for use with monitor extensions on Macintosh 68040 computers and Power Macintosh 6100, 7100 and 8100 computers.
- Some application programs do not properly support resolution changes you make to your monitor. You may have to close and restart your program for the program to recognize the resolution changes.
- If you get an error message when opening the Monitors & Sound control panel that says the System AV extension needs to be installed, and you already have the extension installed, there probably isn't enough memory available to load the extension. Try disabling some extensions or control panels, or turning on Virtual Memory, in order to allow the extension to load during startup.
- On Macintosh Quadra computers with EnergySaver version 1.1, always wake up your monitor by moving the mouse. Waking up the monitor by using the keyboard can cause your computer to freeze and scramble the screen image.
- References to "Pantone" in the manual for this product pertain to PANTONE trademarks of Pantone, Inc.

For Apple ColorSync Displays

- Be sure to attach the ADB cable to the ADB port on the back of your Mac OS-based computer. This connection is required in order to use the advanced features of your monitor. See your monitor manual for instructions on how to attach this cable.
- After you set up your monitor and install the Apple Displays software, use the Monitors & Sound control panel to adjust the color and geometry settings. The monitor is pre-adjusted at the factory, but you can change the settings to better suit your viewing environment and preferences. You can adjust the color, brightness and contrast, image rotation and size, and many other screen geometry settings. See the "Monitors (Apple Displays Extras)" topic in Mac OS Guide for more information.
- If you're upgrading from previous AppleVision or Apple Displays software, and you have custom color settings you want to retain, export the settings as ColorSync profiles before using the new software. Otherwise, your old settings will be lost when you use the new software. For information on exporting ColorSync profiles, see your ColorSync Display manual.
- PANTONE Computer Video Simulations used in DigitalColor Meter software may not match PANTONE-identified solid color standards. Use current PANTONE Color Reference Manuals for accurate color. All trademarks used in DigitalColor Meter software are the property of Apple Computer, Inc, Pantone, Inc., or other companies.

- If the corners of the screen image appear discolored, the monitor rotation setting may need to be adjusted. See the topic "How do I adjust the screen geometry settings" in the "Monitors (Apple Displays extras)" section of Monitors & Sound Guide for instructions.
- If you set the Auto Recalibration feature so that it activates after a resolution change, your monitor will recalibrate when you start up or restart your computer. This happens because the monitor changes resolutions during the startup process. You can turn on the "Ask before recalibrating" option to display a dialog box that will allow you to cancel the recalibration before it occurs. Or, turn off Auto Recalibration for resolution changes to prevent recalibration. Refer to Macintosh Guide for more information about recalibration settings.
- If the shutdown dialog box erroneously appears when you use the AppleVision monitor with an Apple PowerBook Duo MiniDock or similar third-party product, try using an external keyboard connected to the monitor instead of the PowerBook computer's keyboard.
- Changes you make to screen geometry apply only to the monitor's current resolution. When you change resolution, the geometry of the screen may also change.
- If you have the Radius Soft Precision Color extension (version 3.1.1) installed, you should remove it before using the AppleVision software. The extension provides multi-resolution support for Built-in video on Quadra and Centris computers using system software without the Display Manager software. It is not needed with the Apple Displays Software because Display Manager is automatically installed as part of the Display Enabler extension.
- When you're adjusting the monitor using the buttons on the front of the monitor, press one button at a time. If you press more than one button at once, the settings might change to all the way up or down. If you are using an AppleVision 1710, pause for a second between pressing one button and another. Rapidly switching which button you press can sometimes lead to errors.
- If you change from an AppleVision or ColorSync monitor to a small-screen (14" or less), fixed-resolution monitor, set the resolution of the AppleVision or ColorSync monitor to 640 x 480 before turning off your computer and disconnecting the monitor. This will prevent scrambled video during the startup process on the small-screen monitor.
- The Apple Displays Software supports resolutions of up to 1600 x 1200 on some ColorSync monitors. See the documentation that came with your monitor to determine if your model supports this resolution. Some video cards, such as ATI's XCLAIM GA, will support this resolution but may require an updated monitor driver from the manufacturer. ATI is currently creating this update; please contact ATI customer service for more information.
  Note: The ATI graphics card included with the Power Macintosh 9500 does not support 1600 x 1200 resolution and cannot be modified with the new XCLAIM GA driver.

Sound tips

If your Apple monitor has speakers and a built-in microphone, the following tips may help you:

- At high volume levels, playing some sounds may cause patterns or distortion of the screen image. The audio circuitry in the monitor is high-powered in order to provide excellent sound quality, not loud volume. Reducing the volume setting will prevent the image from being affected by the sound.
- If an audio or video application, such as Apple Video Player, is in use, you might not be able to change the sound input setting in the Monitors & Sound control panel. This occurs because the application is using the sound driver and won't allow Monitors & Sound to change the setting. To change the Sound Input setting, quit the other application; then change the setting.
- On Macintosh Quadra 840AV & Macintosh Quadra 660AV, and PowerBook 540c computers, the Mute checkbox in the Sound window of Monitors & Sound does not mute the sound. If you select the checkbox, the X is removed automatically and sound is not muted.
- On Macintosh Quadra 630, Macintosh LC 630, and Power Macintosh 6200 computers, make sure you specify the correct sound input setting in the Monitors & Sound control panel. For these computers, choose Line In in the Sound Input pop-up menu.
- On Macintosh Centris 650 computers, sound input is automatically set to microphone if you have one connected to your computer. In order to record from another source, such as the internal CD player, disconnect the microphone from the computer.
- On the AppleVision 850AV monitor, in some cases when the monitor goes to sleep or the computer restarts, sound may briefly play through the monitor speakers even when the speakers are muted. This occurs when you have a live, line-level microphone (or other audio device) plugged into the monitor's sound input port and the Monitor Sound Preferences are set to "Mute Monitor Speakers while in Energy Saver Mode".

Notes about Macintosh (or Mac OS) Guide

- Some topics in Macintosh Guide may contain information that is incorrect after you install the Apple Displays software. If a Guide directs you to use the Sound control panel or the Monitors control panel, refer to the instructions under the topics "Monitors (standard settings)," "Monitors (Apple Displays extras)," and "Sound" for correct information about using your ColorSync monitor.

Files installed with Apple Displays Software version 1.5.5

The following files are installed by the Apple Displays software installer, unless a newer version of the same file is already installed on your system.

Filename	Version	Location
DigitalColor Meter	1.1	Apple Menu Items
Monitors & Sound	1.3.2	Control Panels
ColorSync System Profile	2.1	Control Panels
Control Strip	1.4.1	Control Panels

Energy Saver (only installed for non-PCI Macintosh users)	1.1	Control Panels
Display Enabler (note space before the D in the name)	2.2.2	Extensions
73/75/76/8500 Graphics Driver	1.4	Extensions
Apple Guide	2.1.1	Extensions
ColorSync	2.1.2	Extensions
PANTONEColor Picker	2	Extensions
Sound Manager	3.2.1	Extensions
SystemAV	1.3	Extensions
Â°AppleVision	1.5.5	Extensions
AV Monitors Guide	2.1.2	Extensions:Global Guide Files
DigitalColor Meter Guide	1.1.2	Extensions:Global Guide Files
Monitors & Sound Guide	2.2.1	Extensions:Global Guide Files
Monitor Bitdepth	1.0.2	Control Strip Modules
Monitor Resolution	1.0.2	Control Strip Modules
Sound Volume	1.4.1	Control Strip Modules
ColorSync Profiles	-	Preferences:ColorSync Profiles
Apple Displays Read Me	1.5.5	Apple Extras:Apple Displays Software Extras

PowerPC G3 Processor: Description

This article describes the PowerPC G3 microprocessor.
This article has been archived and is no longer updated by Apple.
The emergence of the PowerPC G3 processor marks the third generation in the development of advanced processor technology. The PowerPC G3 builds on many of the features pioneered by the PowerPC 603 and 604. However, this chip differs from the earlier implementations of PowerPC processor technology in several significant ways, all designed to further increase performance:

Mac OS optimization

The PowerPC G3 is the first processor specifically optimized for the Mac OS. Optimization designs were based on many popular Macintosh applications to ensure minimal branching and the shortest data transfer routes -- resulting in a very efficient processor.

Innovative level 2 backside cache design

The level 2 cache is the link between level 1 on-chip cache and main memory. By relocating the level 2 cache from the logic board to the processor card (hence the name "backside"), the CPU can access level 2 cache directly using a dedicated bus specifically designed for this purpose. This enables the more effective use of level 2 cache, because even relatively large amounts of data can be stored and accessed rapidly and efficiently.

As processor speed increases, so does the performance value of the backside cache. This design significantly speeds access to the level 2 cache and dramatically increases the overall system performance.

Large level 1 (on-chip) data and instruction caches

Level 1 cache is a small amount of high speed memory built into the processor and in the PowerPC G3 this cache has been doubled from 32k to 64k. With 32k dedicated to instructions and 32k dedicated to data, the processor can store frequently requested data in the cache and access it more rapidly.

State-of-the-art manufacturing process technology

Finally, the 0.25-micron process used to produce the PowerPC G3 processors does more than merely boost performance; it also enables the creation of smaller, cooler processors with extremely low power requirements.

Backside Cache -- Unleashing Processor Performance

By far the biggest boost to performance that the PowerPC G3 offers can be credited to its incorporation of an approach to level 2 cache memory known as backside cache. This approach effectively bypasses limitations on the speed at which transactions between the processor and the level 2 cache can occur. Earlier PowerPC processors used the system bus to access both the level 2 cache memory and the main memory, which could result in conflicts. For example, under the previous approach, at processor clock speeds above 200 megahertz, the CPU would often stall as it waited for data to arrive from the level 2 cache. To prevent such slowdowns, the PowerPC G3 processor features a new dedicated bus that handles only the CPU/cache transactions. This bus can operate at higher speeds than the system bus -- speeds that relate incrementally to the clock speed of the processor. This enables the more effective use of level 2 cache, because even the relatively large amounts of data they can store can be accessed by the process
or rapidly and efficiently. In fact, as clock speeds increase, so does the performance value offered by the backside cache design.

Learning to Look Beyond Megahertz

The performance enhancements of the PowerPC G3 processor significantly reduce the usefulness of clock speed in attempting to compare computer performance. Apple systems based on this processor consistently outperform systems with higher clock speeds -- in fact, they also outperform Pentium II- based systems. Some examples follow.

- A 250-megahertz Macintosh PowerBook G3 is faster than a 266-megahertz Pentium II desktop.*
- A 233-megahertz Power Macintosh G3 is faster than the Power Macintosh 6500/300 and the Power Macintosh 8600/300.**
- A 266-megahertz Power Macintosh G3 provides performance that is on average 30 percent faster than that of a comparable 266-megahertz Pentium II system.*

All of which means that it's more important than ever to consider overall product design -- megahertz alone does not tell the whole story.

* Based on Apple internal tests running 15 separate Adobe Photoshop filters.
** Based on Apple internal testing using MacBench 4.0 processor performance scores. Actual performance on applications may vary. MacBench is a subsystem-level benchmark that measures the relative performance of Mac OS-based systems.

PowerBook G3: Video Out Specifications

This article describes the PowerBook G3 built-in video out specifications.
This article has been archived and is no longer updated by Apple.
Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, please see the following article:

Article 24604: "**PowerBook G3 & G3 Series: Identifying Different Models**"

The PowerBook G3 computer has a VGA connector built into the backplane for an external video monitor. The connector is standard DB9/15 for use with VGA or SVGA monitors.

You can connect a VGA or SVGA monitor all the way up to a 21" monitor with 1024 x 768 resolution projected in thousands of colors (16-bit). Video projection devices can also be attached via the VGA connector.

Video Adapter
An optional video adapter allows the user to connect a standard Apple video cable to the computer. The adapter is identical to that shipped with PowerBook 2400 and 3400 series systems. The adapter is black and enables the PowerBook G3 computer to recognize a wider range of monitor types. The Apple part number for the new adapter is 590-0289-A.

Video RAM
The PowerBook G3 ships with 2MB of VRAM which enables it to support up to 24 bits per pixel on most monitors.

NOTE: The video RAM (VRAM) is not upgradeable.

Video Mirroring
There is no video mirroring control panel/strip. If the external monitor can display 800 by 600 pixels at 60 Hz, the PowerBook G3 computer can display simultaneously on both the external monitor and the flat panel display. This mode of display, called Simulscan, provides the same information on both displays.

Examples: When connected to a 17" Multiscan monitor:

- 640x480 67Hz - Millions of colors (external monitor available only)
- 800x600 60Hz - Thousands of colors (Simulscan "Mirroring")
- 800x600 75Hz - Millions of colors (external monitor available only)
- 832x624 75Hz - Millions of colors (external monitor available only)
- 1024x768 75Hz - Thousands of colors (external monitor available only)

Important Information About Using an External Monitor

If you connect an external monitor to your PowerBook G3 and it remains black, you can try the following: While holding down the Control Key, click on the Monitors Resolution Control Strip module. A list of all the supported resolutions will be shown. You can click on the appropriate resolution for your monitor and the PowerBook G3 will start displaying video on it. If you use this procedure, you will need to repeat it once you shut down or put the PowerBook to sleep. Please consult your monitor specifications in order to decide which resolution is the most appropriate.

Monitor Pixel Depths

The following table lists the pixel depths supported for each type of monitor.

Monitor Pixel Depths		
Monitor type	Resolution	Bits per pixel
12-inch color	512 by 384	8, 16, 24
12-inch monochrome	640 by 480	8, 16, 24
13-inch and 14-inch color	640 by 480	8, 16, 24
VGA and SVGA (1)	640 by 480	8, 16, 24
SVGA	800 by 600	8, 16, 24
SVGA	1024 by 768	8, 16
Full-page monochrome	640 by 870	8
Full-page color	640 by 870	8, 16
16-inch color	832 by 624	8, 16, 24
Apple 15-inch multiple scan	640 by 480	8, 16, 24

Apple 15-inch multiple scan	800 by 600	8, 16, 24
Apple 15-inch multiple scan	832 by 624	8, 16, 24
Apple 17-inch multiple scan	640 by 480	8, 16, 24
Apple 17-inch multiple scan	800 by 600	8, 16, 24
Apple 17-inch multiple scan	832 by 624	8, 16, 24
Apple 17-inch multiple scan	1024 by 768	8, 16
Apple 20-inch multiple scan	640 by 480	8, 16, 24
Apple 20-inch multiple scan	800 by 600	8, 16, 24
Apple 20-inch multiple scan	832 by 624	8, 16, 24
Apple 20-inch multiple scan	1024 by 768	8, 16
NTSC TV monitor (1, 2)	512 by 384	8, 16, 24
NTSC TV monitor (2)	640 by 480	8, 16, 24
PAL TV monitor (1, 2)	640 by 480	8, 16, 24
PAL TV monitor (2)	768 by 576	8, 16, 24

Table Notes	
1	Indicates the startup resolution for non-multiple scan monitors. Other resolutions can be selected using the Monitors control panel or the control strip.
2	Requires Apple Presentation System (M2895LL/A) or similar adaptor.
-	When connected to a non-multiscan monitor you will only get the external monitor at the set resolution. Example: Apple 16-inch monitor, 832 by 624 at 75Hz - Thousands of colors

Apple Presentation System (M2895LL/A)
The Apple Presentation System makes it easy for you to create a presentation on your Macintosh, then display it to an audience on a larger television screen exactly as it appears on your Macintosh display. You can also connect your Macintosh to a VCR and record your presentation on videotape for easy and inexpensive distribution. The Apple Presentation System comes with software, cables, and video converter box. Unlike the Apple Video and Apple Video/TV systems, the Apple Presentation System can be used with any Macintosh that has a VGA or Apple 13/14-inch RGB output. This list includes, but is not limited to, any PowerBook with VGA or Apple 13/14-inch RGB output, Macintosh LC, Performa 400-600 models, Centris, Quadra, or other Macintosh systems with VGA video out.

Power Macintosh G3: Audio and Audio/Video Card Internal Connectors

This article describes the internal connectors on Audio and Audio/Visual cards.

This article has been archived and is no longer updated by Apple.
There are five different connectors used on the two cards. A description of each card's connectors is below.

Audio Card

The Audio card has two connectors on the circuit board itself.

Figure 1, Audio card connector locations

Connector J8
This connector is for a Front Control Panel module which includes infrared, headphone jack and volume controls. This connector is not used in the Mini-Tower and Desktop Power Macintosh G3 systems.

Connector J10
This connector is used for adding an internal modem to your Power Macintosh G3. Currently the Apple/GV 56K Flex modem is the only modem qualified for this slot.

Audio/Video Card

The Audio/Video card has four connectors on the circuit board itself.

Figure 2, Audio/Video card connector locations

Connector J2
This is a DAV connector. The Digital Audio Visual (DAV) connector permits PCI cards that have DAV connectors to manipulate audio and video signals directly from the Audio/Video card.

Connector J4
This connector is for a Front Control Panel module which includes infrared, headphone jack and volume controls. This connector is not used in the Mini-Tower and Desktop Power Macintosh G3 systems.

Connector J6
This connector is for a TV/FM Tuner module. This connector is not used in the Mini-Tower and Desktop Power Macintosh G3 systems.

Connector J7
This connector is used for adding an internal modem to your Power Macintosh G3. Currently the Apple/GV 56K Flex modem is the only modem qualified for this slot.

Power Macintosh G3: Monitor Power Port Not Switched

This article explains why the display doesn't power off when the system is shut down.
This article has been archived and is no longer updated by Apple.
This behavior is normal for your computer. The monitor power port on the Power Macintosh G3 Mini-Tower and some Power Macintosh G3 Desktop enclosures is not switched off when the computer is powered off. This means a display connected to this port will not power off when the computer is powered off. This port acts as if you plugged your display directly into a power outlet.

Note: The Power Macintosh G3 (Blue and White), Power Mac G4 (PCI Graphics), and Power Mac G4 (AGP Graphics) have the same type of monitor power port.

For example, if you connect a non-EnergyStar compliant display such as the Apple High Res RGB Display, the power light will stay on even if your G3 is powered off. If you connect an EnergyStar compliant display such as the Multiple Scan 17-inch display, the monitor will go into a sleep state indicated by an amber light instead of the green power light when your G3 is powered off.

If your monitor is not powering off or going into a sleep state when your Power Macintosh G3 is shut down, you will need to manually power it off using the power switch.

Note: Most Power Macintosh G3 Desktop computers have a switched monitor power receptacle (AC power to the monitor power recepticle is cut once the computer is powered off).

Apple Software Restore: How to Perform a Single Disc Restoration

This article explains how to use Apple Software Restore to reinstall the operating system and application programs that came with your computer.

Note: This article is not about the Apple Restore program that came with some Macintosh Performa computers.

This article has been archived and is no longer updated by Apple.
Important: If your computer came with only Mac OS 9.1 or earlier installed on the hard disk, you should follow the steps in this article. If your computer came with both Mac OS 9.1 and Mac OS X installed on the hard disk, you should follow the steps outlined in article 60847: "**Apple Software Restore: How to Perform a Multiple Disc Restoration.**"

Apple Software Restore allows you to restore the operating system and application programs that came with your computer.

Follow these steps to restore software to your hard disk:

1. Find the Software Restore CD that came with your computer.
2. Insert the disc into the drive.
3. Choose Restart from the Special menu to restart the computer.
4. Press the C key until the "Welcome to Macintosh" message appears. (This key allows the computer to start up from the CD.)
5. Locate and double-click the Apple Software Restore icon.

Figure 1 Apple Software Restore configurations
Note: Versions of Apple Software Restore prior to 1.3.1 do not have the Volume Format option.

6. Select the configuration you wish to restore, then click Restore.
7. When the process is finished, Restart your computer to use the new software.

PowerBook: SCSI Cables Used

This article provides pictures and descriptions of SCSI cables used with PowerBook computers.
This article has been archived and is no longer updated by Apple.

HDI-30 System Cable (No graphic shown)
Attaches an external SCSI device (hard drive, Zip drive, CD-ROM, scanner, etc.,) to the PowerBook. Has 29 pins (one corner pin "missing") in the small end that attaches to the PowerBook.

HDI-30 SCSI Disk Adapter
Makes the PowerBook act like a hard drive when attached to another computer (referred to as SCSI or Target Disk Mode). Has 30 pin in the small end that goes into the PowerBook. The 30th pin tells the PowerBook to act like a hard drive. When booted this way, the PowerBook's monitor will show a SCSI icon floating across the display.

Figure 1, HDI-30 SCSI Disk Adapter

Pass-through SCSI Terminator
Used between the PowerBook and another SCSI Device.

Figure 2, Pass-through SCSI Terminator

Peripheral Interface Cable
Used to connect one SCSI device to another.

Figure 3, Peripheral Interface Cable

Extender Cable
Used as an extension between two devices on the SCSI chain.

Figure 4, Extender Cable

Power Macintosh G3 makes no sound from the internal modem

The loss of internal modem sound should first be distinguished from the loss of modem functionality in general.
This article has been archived and is no longer updated by Apple.
This article assumes that the modem is functional in other respects besides not providing audio feedback during the course of the connection sequence, which typically proceeds through a brief dial tone, then the usual touch tones as the telephone number is dialed, and finally the modem handshaking tones (squealing, static, and so forth). If all of this audio feedback is absent, but the modem otherwise works, proceed as follows:

1. Open the Monitors & Sound control panel and click on the "Sound" button at the top of the control panel.
2. Adjust the "Computer System Volume" slider such that it is at a level at which the system beep can be heard distinctly (the system will beep each time the slider is adjusted).
3. Click on the "Sound Monitoring Source" pop-up menu and ensure that "Internal Modem" is selected. The audio feedback from the modem should now return.

Vicom Internet Gateway: Running TCP/IP Applications On Gateway

I am running AppleShare IP, MacDNS, and Vicom Internet Gateway. With the server set to load at startup, or MacDNS in the startup items folder, the system crashes after the Finder loads.
This article has been archived and is no longer updated by Apple.
This issue is documented in the Read Me file accompanying Vicom Internet Gateway updaters available on their website.

From the Vicom Read Me:

> **Running TCP/IP server applications on the Gateway machine**
>
> If any TCP/IP server applications are run on the Gateway machine the mirror port should be set as follows:
>
> - If the Internet Proxy port has a static address then this port should be mirrored. Users accessing the server from inside the network access it at this address, as do users on the Internet.
>
> - If the Internet Proxy port has a dynamic address then the Internal (normally Ethernet) port should be mirrored. Users inside the network access the server at the internal address. Users on the Internet access the server at the address of the Internet Proxy port. Users from the Internet would of course need to know the address the Internet Proxy port had obtained.
>
> To mirror a port, select the port required in the status window and select "Mirror This Port" from the "Ports" menu.
>
> Please note that the Internet Gateway must be loaded and turned ON, before any server applications are loaded.

Vicom recommends TCP/IP be set to load only when needed. Set AppleShare Web & File Server not to load at startup. This can be done in the Server Settings window of AppleShare Web & File Admin. To have the server launch at startup along with Vicom and MacDNS place aliases of each application in the Startup Items folder. Rename Vicom Internet Gateway alias so that it comes first alphabetically. Vicom also needs to be set to turn itself on when it launches. Refer to Vicom documentation for information on how to accomplish this.

Power Macintosh G3: Ethernet/Comm Slot Support

This article explains the Communications Slot (Comm Slot) on Power Macintosh G3 computers, and which kinds of cards may be used with them.

This article has been archived and is no longer updated by Apple.
The Communications Slot architecture was introduced in 1994 as an extra slot that would provide customers with the ability of using inexpensive communications cards, such as Ethernet and modem cards. These slots were mainly made available on entry-level systems. This architecture predated the widespread adoption of the Peripheral Component Interconnect (PCI) architecture by the computer industry, which turned out to be another way for users to inexpensively add capabilities to their computers.

The original Comm Slot architecture was known as Comm Slot I, and was the one used on computers such as the Power Macintosh 6200, 6300, 5200, and 5300.

The Comm Slot II architecture is used with the Power Macintosh 5400, 6360, 6400, and 6500 series computers, as well as the Twentieth Anniversary Macintosh.

The two architectures share similar features, but they are not identical. To prevent the wrong card from being used, notches are placed on the connector in various locations. This prevents the wrong card from being used.

Cards which are designed for both types of slots are called "universal" cards.

G3 computers support a new "personality card" architecture, which is used in a slot, known as a PERCH slot, on the logic board. Two personality cards are currently available for this slot. Each card provides sound support for the computer, as well as a modem slot on the card. The A/V card also works with video in and out.

The PERCH slot on the logic board is not a Comm Slot. This slot cannot be used for any type of Comm Slot II-capable card.

The slot on the personality card uses the same connector as a Comm Slot II connector, and Comm Slot II cards will fit. However, the slot on the personality card is a modem slot, only providing serial support for Comm Slot II-capable modems. This slot does not work with Ethernet cards, and should not be regarded as a Comm Slot II slot.

When a modem is plugged into the slot on the personality card, the external modem port on the back of the computer is disabled.

If you require an alternate Ethernet solution beyond that which is provided with the RJ-45 10T port that comes with all G3 computers, you may wish to explore a third-party PCI Ethernet card.

Mac OS 8: Desktop Picture Control Panel Troubleshooting

This article offers troubleshooting tips for the Mac OS 8 Desktop Pictures control panel.

This article has been archived and is no longer updated by Apple.

Troubleshooting tips

- The Desktop Pictures control panel requires AppleScript to operate correctly. Using the Extensions Manager control panel, ensure that the Desktop Pictures control panel is active.
- Some extensions may prevent the Desktop Pictures control panel from operating correctly. Conflict Catcher 3 from Casady & Greene may not work with Desktop Pictures. Casady & Greene released a newer version, Conflict Catcher 4, that resolved the issue. If you have Conflict Catcher, make sure you have the current version which you can obtain from Casady & Greene.
- Use the Extension Manager control panel to switch to either Mac OS 8 Base or All extensions, and restart your computer.
- If Desktop pictures does not work with Mac OS 8 Base extension set selected, locate the Desktop Pictures Prefs file in the Preferences folder inside your System Folder and drag it to the Trash. Restart the computer and try again. If it still does not work, delete the prefs file again and reinstall the Desktop Picture control panel from your original CD (it is listed in Control Panels in the Custom Install options).
- If it works with Mac OS 8 extensions, but does not work with all your extensions active, it is likely that another extension is conflicting with the Desktop Pictures control panel and you will need to troubleshoot each extension.

For more information on the Desktop Pictures control panel introduced in Mac OS 8, refer to article 24175: **Mac OS 8: Limitations of Desktop Pictures Control Panel**.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

Mac OS: Desktop Printing Troubleshooting

This article offers a procedure to resolve issues related to desktop printing.
This article has been archived and is no longer updated by Apple.
Some users have reported the following difficulties with desktop printing:

- choose print and nothing happens or jobs hang in the queue
- choose print and get "printer not found" message
- choose print and get "The file 'XXX' will be moved to the desktop because it is not a valid print file" message
- setup printer in Chooser and no desktop printer created (except the StyleWriter 4000 series)
- -192@18 error caused by desktop printing
- -43@87 error caused by desktop printing
- multiple desktop printers for same printer created on desktop
- "flashing" desktop printer icon (disappears and reappears)
- cannot create a desktop printer icon

Solution

If you have printing difficulties that are eliminated by disabling desktop printing, the following steps will usually restore desktop printing functionality:

1. Start with desktop printing disabled (this is important). You can disable desktop printing using the Extensions Manager control panel.
2. Drag all desktop printer icons from the desktop to the Trash.
3. Drag the printing prefs folder (located inside the Preferences folder, which is inside the System folder) to the Trash.
Note: If necessary, save your watermark files before deleting the printing prefs folder, or re-install the watermark files after troubleshooting is complete.
4. Drag the PrintMonitor documents folder (in System folder) to the Trash.
5. Add 100 Kilobytes (100K) to minimum and preferred memory sizes of the Desktop PrintMonitor application (in Extensions Disabled folder) by selecting the application and Choosing Get Info from the File menu.
6. Re-enable desktop printing extensions using the Extensions Manager control panel.
7. Restart and rebuild the Desktop file by pressing the Apple and Option keys down until a few seconds after the rebuild is complete.
8. Try renaming AppleTalk printers (for example, most LaserWriter printers) using the Apple Printer Utility.

If you are experiencing any of the above issues, you should upgrade to Mac OS 8.1 or later available from the Apple Software Updates Web site at http://www.apple.com/swupdates. Many desktop printing issues are resolved in this update.

For more information on issues with desktop printing, refer to Knowledge Base article 30413: "**Macintosh Desktop Printing: 'Endless Loop' Issue**"

Power Macintosh G3: Modem Software Read Me

This article contains the Power Macintosh G3 Modem Software Read Me document.

This article has been archived and is no longer updated by Apple.

Necessary Information for Using Your Optional Internal Modem

If you ordered an internal modem when you purchased your Build-to-Order Macintosh computer, you need to install some of the software on this CD for the modem to reach its maximum data transfer speed and send and receive faxes. This Read Me describes the software and includes instructions for installing it on your computer.

The software you need is in the two folders alongside this Read Me file. These items are:

- a modem script that enables the Apple/GV 56K modem to reach its maximum 56.6 K data transfer speed
- an electronic document called "ATCom56flex(apple).pdf," which contains technical information required for creating customized modem scripts
- FaxSTF software, which lets you use your modem to send and receive faxes
- an electronic document containing instructions for using the FaxSTF software (You can find and read this document after you install the FaxSTF software.)

Important: Installing the modem script does not guarantee that your modem will always reach its maximum speed. Data transfer speed depends on several factors.

To open the electronic documents, you need to install Acrobat Reader 3.0 on your computer. You can find the application in the CD Extras folder on the Power Macintosh CD that came with your computer.

Installing the Modem Script

To install the modem script, follow these steps:

1. Double-click the Modem Script folder to open it.
Inside the folder you see two icons: "Apple/GV 56K" and "ATCom56flex(apple).pdf."

2. Double-click your computer's hard disk icon to open it.

3. In the window that appears, find the System Folder icon and double-click it to open it.

4. In the window that appears, find the Extensions folder icon and double-click it to open it.

5. Locate the Modem Scripts folder within the Extensions folder.

6. Drag the "Apple/GV 56K" icon from the CD into the Modem Scripts folder.

7. Close all the windows.

8. Open the Modem control panel by opening the Apple menu, then choosing the menu item Control Panels and the submenu item Modem.
The Modem control panel appears.

9. Choose Modem Port from the "Connect via" pop-up menu.
Your internal modem is connected to the modem port.

10. Open the Modem pop-up menu and choose Apple/GV 56K.

11. Close the Modem control panel.
Your modem will now use the new modem script.

To read "ATCom56flex(apple).pdf," a technical document, you must install the application Adobe Acrobat Reader 3.0, which you can find on the Power Macintosh CD that came with your computer.

Installing FaxSTF software

FaxSTF software allows you to use your modem to send and receive faxes. The software includes an electronic manual that gives detailed instructions about using the application.

To install the software, follow these instructions:

1. Double-click the FaxSTF folder that appears on the CD alongside this Read Me file.
2. Double-click the Installer 56K icon inside the folder.
3. Follow the instructions on the screen.
4. Restart your computer.

After you restart, an electronic document called "FaxSTF Manual.pdf" appears in the FaxSTF folder. The document contains instructions for setting up and using the FaxSTF software. To read the manual, you must use the application Adobe Acrobat Reader 3.0. If the application is not already installed on your computer, you can find it in the CD Extras folder on the Power Macintosh CD that came with your computer.

Power Macintosh G3: Difficulty using ATI Xclaim GA video card

This article discusses an issue with using an ATI Xclaim GA video card in a Power Macintosh G3.
This article has been archived and is no longer updated by Apple.
Users trying to use an ATI Xclaim GA video card in a Power Macintosh G3 may encounter scrambled video on their monitor. ATI Technologies, Inc. is offering a free BIOS ROM upgrade for those customers attempting to use their Xclaim GA card in a Power Macintosh G3.

If you wish to upgrade the BIOS ROM, contact ATI Technologies directly to request the upgrade for use on Power Macintosh G3 systems.

You must provide your name, address and phone number as well as the current BIOS ROM part number in order to receive the upgrade. The part number of the BIOS ROM is located on top of the BIOS ROM chip itself on a white label. The number is 11 digits and will be formatted like this:

XXX-XXXXX-XXX

You can request priority shipping but will be charged for the shipping and handling of the upgrade.

All information above is from ATI Technologies, Inc.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

LaserWriter 8500: Blinking Ready Light

I have a LaserWriter 8500 on which the ready light flashes back and forth between yellow and green. The printer seems to operate normally otherwise. Can you explain?

This article has been archived and is no longer updated by Apple.

The flashing lights indicate that the printer is in point-of-sale mode. The printer will go into point-of-sale mode by holding down the ready light LED (which is also a button) while turing on the printer. When the printer comes to a ready state, pressing the ready button will produce a demo page from the printer. The printer will continue to function normally when in point-of-sale mode.

To turn this function off, simply hold the ready LED down at power on once more. Alternatively, connect to the printer using Apple Printer Utility (version 2.2 or higher) and turn the "Enable Demonstration Page Button" feature on or off.

For more information, see Chapter 1 and Appendix A in the LaserWriter 8500 user guide.

Power Macintosh G3: 10/100Base-T Ethernet Card Information

This article contains important information and specifications for the 10/100Base-T Ethernet card k option for Power Macintosh G3 computers.
This article has been archived and is no longer updated by Apple.
If your computer came with the 10/100Base-T Ethernet option, a 10/100Base-T Ethernet card is installed in one of your computer's PCI slots. You can connect a cable for a 10/100Base-T Ethernet network to this card.

Note: The type of twisted-pair cable you use depends on whether you connect to 10Base-T or 100Base-T Ethernet. Category 5 twisted-pair cable must be used to connect to 100Base-T if you want to get the maximum speed from this connection.

Checking the Status of a 10/100Base-T Network Connection

If you connect your computer to a network using the 10/100 Fast Ethernet card, you can check the card's LED indicators to monitor network activity. There are four indicators:

ACT (Activity)	Blinks when the 10/100 Fast Ethernet card is active.
COL (Collision)	Glows when a network collision has occurred (a temporary condition that occurs when two computers on a network try to send date simultaneously).
LNK (Link)	Glows when a reliable 10 megabit (Mbit) or 100 Mbit network connection has been established.
100Mb	Glows when a reliable 100 Mbit link is established

10/100Base-T Ethernet Card Specifications

Open Transport	Mac OS 7.5.2 or later, AppleShare, AppleTalk, NetWare for Macintosh, TCP/IP
Connector	RJ-45 (for 10Base-T and 100Base-T)
Media,10Base-T	Cat 3, 4, or 5 UTP on 2 pairs up to 100 meters (m)
Media, 100Base-T	Cat 5 UTP on 2 pairs up to 100m
Bus interface	PCI revision 2.0 and 2.1, share interrupt A
Channel speeds	IEEE Auto Negotiation of 10Base-T and 100Base-TX
Communications	IEEE 802.3u 100Base-TX; IEEE 802.3i 10Base-T
Controllers	DECchip 21140, 32-bit internal processor per channel
Power	1.2 amperes (A) @ 5V typical

Power Macintosh G3: Ultra Wide SCSI Hard Drive Information

This article contains important information and specifications for the Ultra Wide SCSI internal hard disk option for Power Macintosh G3 computers.
This article has been archived and is no longer updated by Apple.
If your computer came with an Ultra Wide SCSI hard disk drive, the following additional components are installed in your computer:

- An internal Ultra Wide SCSI hard disk drive (in place of the standard IDE hard disk drive).
- An Ultra Wide SCSI card in one of your computer's PCI slots.
- An internal Ultra Wide SCSI-3 chain that supports your internal hard disk and up to two additional internal devices. (The Ultra Wide SCSI-3 chain can transfer data at up to 40 MB per second.)

Important: Do not connect any SCSI devices to the external 68-pin SCSI-3 connector or the internal 50-pin SCSI-2 connector on the PCI card that supports the internal hard disk. Connecting even one external SCSI device to the external 68-pin connector extends the overall cable length of the SCSI bus beyond the limit for which error-free operation can be guaranteed; the combined length of the internal cable and the external cable reduces the reliability of all the devices connected to the Ultra Wide SCSI-3 bus. Connecting a device to the internal 50-pin SCSI-2 connector on the Ultra Wide SCSI card will cause your Ultra Wide SCSI-3 devices to transfer data at the slower, SCSI-2 rate. However, you can still connect a device to the internal 50-pin SCSI-2 connector on the logic board without affecting the performance of the PCI card.

About the Ultra Wide SCSI-3 Bus

You can connect up to three internal devices (including your internal hard disk) to the Ultra Wide SCSI-3 bus on this card. (You can't connect more than three because there isn't enough space in the computer.) All devices on the same SCSI bus must have unique ID numbers, but devices on different SCSI buses may use the same SCSI ID number. (For example, you could have a removable media drive with ID number 3 connected to the Narrow SCSI-1 bus and a hard disk with ID number 3 connected to the Ultra Wide SCSI-3 bus.)

The hard disk that was installed in your computer at the factory, as well as the SCSI card itself, have already reserved certain SCSI ID numbers on the Ultra Wide SCSI-3 bus. Other ID numbers are available for assignment to SCSI devices that are added later, as described in the following table.

Ultra Wide SCSI ID number	Device
0	Factory-installed hard disk drive (terminated)
1 through 6	Available
7	SCSI PCI card (terminated)
8 through 15	Available

Important: The factory-installed internal hard disk and the SCSI card are both terminated. Other SCSI devices that you install and connect to the Ultra Wide SCSI-3 bus must not be terminated. If you attach a terminated device to the internal SCSI interface, the computer will malfunction. You use the internal ribbon cable with the 68-pin connectors to connect an internal SCSI device to the Ultra Wide SCSI bus.

Ultra Wide SCSI Card Specifications

- Automatic termination
- Advanced Data Streaming Technology (ADS)
- RAID ready
- Embedded RISC I/P processor
- Ultra SCSI connector: Fine pitch 68-pin "P"
- Flash ROM BIOS
- PCI 2.1 compliant
- Large command FIFO
- Supports disconnect/reconnect
- Asynchronous I/O support
- Multiple initiator support
- SCSI-3 tagged command queuing
- SCSI Manager 4.3 compatible

Power Macintosh G3: No Controls On Apple Video Player

This article explains why some controls may not be available for use on Apple Video Player in certain configurations.
This article has been archived and is no longer updated by Apple.
When using Apple Video Player, you may not be able to see the controls for Video Input selection, Video Capture, Video adjustments, and so forth. The most probable cause of this is that you do not have a monitor connected to the built-in video of your Power Macintosh G3. Apple Video Player is designed to work with the built-in video port of your Power Macintosh G3, so if you have added a PCI video card and have your monitor connected to that, you will be missing the necessary controls for Apple Video Player to display and capture video. The solution in this case would be to shut down your computer and connect your monitor to the built-in video port.

If you have two monitors attached (one to the built-in video port and one to a PCI video card), you will see all the controls in Apple Video Player. However, you will only be able to use them if Apple Video Player is being displayed on the monitor connected to the built-in video. For more information on the two-monitor scenario, please see the following article:

Article 22129: "**Power Macintosh G3: Error in Apple Video Player on Second Monitor**"
Published Date: Feb 20, 2012

Power Macintosh G3: Drivers For 10/100BaseT, Video, and Ultra Wide SCSI

This article describes how to install the drivers for the 10/100baseT and IxMicro Video cards.
This article has been archived and is no longer updated by Apple.
The drivers for these new Build To Order options are not installed with the Mac OS. In order for these options to be used to their fullest potential the drivers need to be in the System folder during startup.

The drivers for the 10/100baseT and IxMicro Video cards are located in a new folder on the Apple Macintosh CD, part number 691-1919, that came with your system. To install these drivers:

1. Insert the Apple Macintosh CD into the CD-ROM drive.
2. Once the CD is mounted, locate the folder named "Important Extra System Software" and open it.
3. Drag all four files on top of the closed System folder on your startup drive.
4. After the files are copied into your System folder, restart the system in order for the drivers to become available.

The names of the driver files are:

Apple 10/100 Fast Ethernet
Apple IX3D RAVE Engine
Apple IX3D Graphics Accelerator
Apple IX3D Video Memory Manager

No driver file is necessary for the Ultra Wide SCSI Card. The Ultra Wide SCSI Card has all appropriate drivers necessary for operation loaded into an onboard ROM or SIM chip. Thus, no software drivers are necessary.

Published Date: Feb 20, 2012

Power Macintosh G3 (Desktop): 128MB Memory DIMM Support

This article explains which kinds of memory modules work with the Power Macintosh Desktop G3.
This article has been archived and is no longer updated by Apple.
The Power Macintosh Desktop G3 supports SDRAM DIMMs as defined by the mechanical JEDEC MO-161 specification, and the electrical specification as defined by the JEDEC Standard.

Electrically, the Power Macintosh Desktop can support 384MB of memory, using three low profile 128 MB DIMMs. Without low profile 128 MB DIMMs, the computer is limited to three 64 MB DIMMs for a total of 192 MB.

Note: Power Macintosh G3 computers (Desktop and Minitower) that have revision 3 logic boards can support 256MB DIMMs for a total of 768MB of installed RAM. Refer to Kbase article 24924: "**Power Macintosh G3: Identifying The Logic Board Revision**" to identify which logic board a Power Macintosh G3 came with.

Some third party vendors have redesigned their 128MB DIMMs to be slightly shorter and to fit in the desktop case. If the developer has followed the electrical JEDEC specification and verified the design and functionality for the Power Macintosh G3 Desktop, then these shorter DIMMs should work without issue in the Power Macintosh Desktop G3.

In addition, it is the responsibility of the third party manufacturer, not Apple, Inc., to verify the design and ensure the reliability of their memory modules, including standardized parts, designed for the Macintosh.

Published Date: Feb 20, 2012

Mac OS: AppleTalk "Port in Use" Error

While trying to print an error message appears stating the port is in use and AppleTalk needs to be inactive. Trying to disable AppleTalk using the Control Strip or the Chooser does not disable AppleTalk.

This article has been archived and is no longer updated by Apple.

Making AppleTalk Inactive

The default networking option for the Macintosh is to use the printer port for AppleTalk. In order to use the printer port for a serial device it is necessary to stop using the printer port for AppleTalk. There are two ways to accomplish this. The first is to move AppleTalk to another port such as Ethernet (if you are connected to an active Ethernet network). The second method is to make AppleTalk inactive.

During the migration from Classic Networking to Open Transport, older components of the networking software have not been upgraded to fully support Open Transport. Two such components are the Chooser and the AppleTalk Switch Control Strip Module. If AppleTalk is made inactive using either the Chooser or the Control Strip then only Classic AppleTalk components are made inactive. Open Transport AppleTalk components are still active. When you attempt to use the printer port for a serial device, the following error messages (or similar messages) may result:

"Printer port is in use by another application"
"Cannot find printer"
".[XXX printer driver] requires that AppleTalk is inactive. Please make AppleTalk inactive."

Follow these steps to make AppleTalk inactive under Open Transport:

1. Open the AppleTalk control panel.
2. Select User Mode under the Edit menu (or Command-U).
3. Select Advanced user mode and click OK.
4. Click on the Options button.
5. Select Inactive and click OK.
6. Close the AppleTalk control panel.
7. Save the changes.

For information on making AppleTalk inactive within the Classic Networking architecture, please see article 30168: "**Mac OS: Chooser Defaults to Modem Port**"

For Mac OS 8.1 users, Apple Location Manager 2.0.1 offers a convenient way to turn AppleTalk on and off. For more information, please refer to the Read Me included with Apple Location Manager 2.0.1.

For more information on Apple Location Manager 2.0.1, please see article 26162: "**Apple Location Manager 2.0.1: Description**"

Published Date: Feb 20, 2012

Power Macintosh G3: No video w/ Blank or Solid-color Screen.

This article explains why the video window of Apple Video player may appear as a blank or solid-colored screen on Power Macintosh G3 computers, and how to avoid this situation.
This article has been archived and is no longer updated by Apple.
When there is insufficient VRAM to display video in the video window, Apple Video Player will default to a blank or solid-colored screen. Depending upon how much VRAM is installed, the resolution and bit-depth at which this will occur will vary.

For example, on a stock Power Macintosh G3 with the base 2 MB VRAM configuration, any resolution 800 x 600 or higher will cause the video window to turn blue if the system is configured to display millions of colors. Lowering the bit-depth and/or resolution will correct. Therefore a 640 x 480 at 24-bit color configuration would be possible and not result in a blue/green screen.

It may be useful to keep in mind that some video codecs, such as the Apple Video codec that Apple Video Player is designed to use (as opposed to Cinepak or Component video, for example), only saves video information at 16-bit color (thousands of colors) anyway. For the vast majority of video capture applications, 16-bit color is all that is needed and is indistinguishable to the eye from 24-bit color in this context.

PowerBook G3, 3400, 5300, 190: Battery Interchangeability

The PowerBook G3, 3400, 5300 and 190 all use the same shape battery. Are the batteries interchangeable between the PowerBooks?
This article has been archived and is no longer updated by Apple.
To a certain extent, the batteries are interchangeable. The information below specifies which computers support which batteries.

PowerBook G3

The PowerBook G3 battery, model number M4895, it is a Lithium Ion (LiIon) 47 watt-hour battery. The G3 will recognize and charge all three models of batteries, M4895, M5139 and M3254. However, the battery life with the other batteries will be much less than when using the intended battery.

PowerBook 3400

The PowerBook 3400 battery, model number M5139, is a Lithium Ion (LiIon) 32 watt-hour battery. The 3400 will recognize and charge all three models of batteries, M4895, M5139 and M3254. The battery life when using the M3254 battery will be much less than when using the intended battery.

In order for the PowerBook 3400 to be able to charge the PowerBook G3 battery, M4895, you will need to upgrade to Mac OS 8.1. The Mac OS 8.1 update includes the necessary software that will allow the PowerBook 3400 to recognize and charge PowerBook G3 batteries. If you are using Mac OS 8.0 (or older), you will not be able to charge the battery.

PowerBook 5300 and 190

The PowerBook 5300 and 190 battery, model number M3254, is a Nickel Metal Hydride (NiHM) 29 watt-hour (approximate) battery. The PowerBook 5300 and 190 will only recognize their own battery. They do not have the circuitry to be able to recognize and charge a Lithium Ion (LiIon) battery.

Published Date: Feb 20, 2012

Power Macintosh G3: Obtaining Optimal Video Capture Frame Rates

This article describes how to get the best video capture frame rate with your Power Macintosh G3 computer.
This article has been archived and is no longer updated by Apple.

Optimizing Video Capture Performance

In general, there are a few things you can do to optimize video capture performance.

The Power Macintosh G3 minitower with the Audio/Video card can support up to 320- by 240-pixel video capture at 30 frames per second. This rate is for capturing video only. This rate decreases if both audio and video are captured simultaneously.

Most video capture applications use standard QuickTime Video and Audio settings. How you set these settings can affect the performance of video capture significantly. The PowerMac G3 Read Me included every Power Macintosh G3 computer states:

Video capture is available on Power Macintosh G3 computers with video input and output ports.

- The video capture feature works with Virtual Memory (VM) on, but the quality of captured video improves if VM is turned off. AppleTalk should also be made inactive while capturing to prevent network activity from introducing slight variations in the quality of captured video.
- The monitor connected to the built-in graphics port should be set to Thousands of Colors and the capture window size should not exceed 320 x 240 pixels. The best compression to use with this computer is Component Video.
- If you have difficulty capturing video or the captured video looks very pixelated, try reducing the resolution and/or number of colors on the monitor connected to the built-in graphics port.
- If you have a monitor connected to the built-in graphics port and another monitor connected to a PCI graphics card, then to capture video you must have the video capture window of whichever application you are using completely contained on the monitor connected to the built-in graphics port.

The following are general settings that can help optimize video capture performance on a Power Macintosh G3 Minitower computer under Mac OS 8.1. You may need to change settings depending upon what application and OS version you are using. Check with the developer of the application you are using for their recommended settings.

System Configuration:

Extensions Manager Settings:

- Select Mac OS 8.1 or 8.5 base Set
- Duplicate set and save as QuickTime Capture (this will be your Extensions set when you want to capture video).

Load only the following control panels at startup:

- Control Strip
- Memory
- Monitors & Sound
- QuickTime Settings

Load only the following extensions at startup:

- ATI 3D Accelerator
- ATI Graphic Drivers
- ATI Graphics Accelerator
- ATI Video Memory Manager
- QuickTime
- QuickTime PowerPlug

Memory Settings set in the Memory control panel:

- Disk Cache = 256K
- VM Off
- No RAM Disk

AppleTalk Settings:

- AppleTalk turned off in the AppleTalk Control Panel

Monitors & Sounds Settings:

- Color Depth = Thousands
- Resolution = 832 x 624, 75Hz

Sample Capture Settings for Video Capture Application

Not all settings below are available in Apple Video Player.

Video Capture Window location:

Place the video capture window in the lower right corner of the screen. Video capture performance is optimized when the video capture window is outside the rect 0,0,320,240.

Audio Input Settings:

- Sound Off

Video Input Settings:

- Record at 320 x 240 Compression

Compressor:

Component:

Video Depth:

Color Quality: High (75) Frames per second: 29.97 (29.97 fps is the actual NTSC standard)

Mac OS 8.5 Video Capture Enhancements

The video capturing software for both Power Macintosh G3 and PowerBook G3 Series computers has been significantly enhanced for Mac OS 8.5. In addition two compression settings now directly support capturing. These are the Component Video and Photo-JPEG compressors.

Figure 1 Video settings (compression settings shown)

At quality settings of Medium or less, full rate captures (29.97 frames/second for NTSC, 25 frames/second PAL and SECAM) can be achieved for capture sizes of 320 x 240 or less.

Additionally, under Mac OS 8.5, video capturing is now more tolerant of other system activity. Full rate captures can now be achieved when using Component Video or Photo - JPEG at 320 x 240 or less, even with AppleTalk enabled, File Sharing active, Virtual Memory enabled, and sound being captured.

Note: 320 x 240 captures using Component Video result in over 4.5 MB/second of data being written to the hard disk. Apple uses hard drives from a wide variety of hard drive vendors, and some hard drives might not be able to sustain that data rate. This results in dropped frames.

QuickTime: Windows installation error message

This article has been archived and is no longer updated by Apple.

While trying to install or uninstall QuickTime for Windows an error message appears, and the install/uninstall fails. The message may indicate that you must exit all programs using QuickTime.

Check to make sure no other applications that use QuickTime are open (including iTunes). If there are no other open applications, then make sure the QuickTime control panel window is closed to install or uninstall QuickTime. Close the Control Panel window, then try to install or uninstall again.

To uninstall some older versions of QuickTime, use the uninstall application available in the Programs menu under QuickTime.

QuickTime for Windows: Slow Video

When using Quicktime for Windows, you may experience some videos that play slowly.
This article has been archived and is no longer updated by Apple.

Under Windows, DirectDraw is recommended for optimal performance. Since QuickTime can take advantage of DirectDraw and DirectSound, it is important to have the latest drivers for your video and sound cards. You also need the current version of DirectX.

Check your computer vendor for latest drivers and check Microsoft for updates to DirectX.

ARA 3.0: Configuring TCP/IP and Personal Web Sharing

This article explains how to set up the ARA server to use TCP/IP and share web pages using Personal Web Sharing.
This article has been archived and is no longer updated by Apple.
Here are the steps required for configuring the server:

1. Set TCP/IP control panel to connect via AppleTalk (MacIP).
2. Select Configure Using MacIP Manually. Type in 10.1.1.1 for the IP address. The rest of the fields can be left blank.
3. Open the AppleTalk control panel.
4. If you have an AppleTalk printer connected to the printer port, select the Printer Port in the control panel; otherwise, select Remote Only.
5. In the Remote Access control panel, open up the Answering dialog box from the RemoteAccess menu. Under "PPP server setup" check on the box "Allow TCP/IP clients to connect using PPP." Fill in the Default clients IP address to be 10.1.1.2. Make sure answer calls is selected.
6. Start Personal Web Sharing (or any other TCP/IP server you may have).

Next, configure the client:

1. The TCP/IP control panel should be configured to Connect via PPP, Configure Using PPP Server. All other fields may be left blank.
2. Fill in the PPP or Remote Access control panel for a username and password for a user with dial-in access to the server, and the phone number on the server
3. If you have the Remote Access control panel (instead of PPP), click on the "Options" button, select the Protocol tab, and select PPP. The default settings for the checkboxes which appear will work OK.

Now any computer can dial into your server, connect via PPP, and browse your web pages. To pull up the page server by Personal Web Sharing, connect to the server and type 10.1.1.1 in your web browser (instead of a name like "www.apple.com").

Any system, regardless of operating system (Mac OS, Windows, and so on) should be able to connect to the server with a standard PPP connection and web browser.

Mac OS: Time Zone Info Not Saved After Resetting PRAM

This article explains why after resetting the PRAM Time Zone and Daylight Savings Time information is changed, but not the current date and time.
This article has been archived and is no longer updated by Apple.
Only the Time Zone and Daylight Saving Time settings are saved only in PRAM, not the current date or time. After resetting the PRAM, Time Zone and Daylight Saving Time settings are restored to their default factory settings which are:

- No Time Zone has been specified
- Daylight Saving Time checkbox is unchecked

The current date and current time settings are retained in a separate clock chip on the logic board. This clock is not reset unless the computer's external power and battery power are removed from the computer. Additionally, some Macintosh computers include a reset button on the logic board which also resets the current date and current time.

Mac OS 8.1: Mac OS Extended Format and Performas

This article explains how to install Mac OS 8.1 onto a Performa computer and how to restore the Performa software onto the hard drive initialized in Mac OS Extended format.
This article has been archived and is no longer updated by Apple.
The software included with Performa computers was tested with the version of system software orignally included on the hard disk and the Performa Restore CD. If the system software is upgraded beyond what is included on the CD (such as upgrading from System 7.5.x to Mac OS 8.1), some of the Performa bundled software may not be compatibile. Performa users should check with the respective developers of the bundled Performa software for the latest compatibility information with Mac OS.

Mac OS 8.1 is supported on 68040 or PowerPC processor-based Mac OS-compatible systems; 68030-based systems with PowerPC upgrade cards are not supported. The computer must also have at least 12 megabytes of physical RAM, with virtual memory set to at least 20 megabytes.

Below is an example of the steps one could take to update a Performa 6300CD to Mac OS 8.1 using the Mac OS Extended Format feature. You may have to modify these steps slightly depending on the Performa computer and configuration you are using.

Configuration

- Performa 6300CD with 12 MB of RAM (8 MB of RAM will not work)
- Performa 6300CD Macintosh Performa CD (system software 7.5.1)
- Mac OS 8.1 CD
- Mac OS 8.1 PPC Disk Tools diskette (available from Apple Software Updates sites)

Steps to install the Performa 6300CD Bundle with Mac OS 8.1 and Mac OS Extended Format

1. Back up any information from the Performa's internal hard drive that needs to be saved, because these steps include reinitializing the internal hard disk.

2. Start up the computer and put the Performa Restoration CD in the drive.

3. Restart the computer and boot from Mac OS 8.1 Disk Tools diskette, while leaving the Performa CD in the CD-ROM drive. This will allow the CD to appear after booting from the Disk Tools diskette.

4. After starting up from the Disk Tools diskette, you should also see the Performa Restoration CD.

5. Launch Drive Setup Lite from the Disk Tools diskette and initialize the internal hard disk as a Mac OS Extended volume.

6. Open the "Hard Disk Files" folder on the Performa CD.

7. Drag all folders to the internal hard disk which has just been initialized.

8. Once the copy has been completed, change the name of the folders you just copied to remove the word "Files". For example, "System Folder Files" should be renamed to "System Folder", "Applications Files" should be renamed "Applications", and so on. This System Folder is system software 7.5.1.

9. Eject the Performa CD.

10. Insert the Mac OS 8.1 CD.

11. Run the Mac OS 8.1 installer to update the System Folder on the internal hard disk. (We only custom installed Mac OS 8.1)

12. After updating the System Folder to Mac OS 8.1, open the new System Folder on the hard disk and remove the extension named "Screen Posters" if it is present. (On our test computer, we experienced an "Unimplemented Instruction" error if this extension loads at startup.)

13. Restart the computer, eject the Mac OS 8.1 CD and remove the Disk Tools diskette.

14. The computer should now start up with Mac OS 8.1 with Mac OS Extended volume support.

Important Note: Some software that was included with your original Performa may not be compatible with Mac OS 8.1 or Mac OS Extended Format. Please check with the respective developer of the software for the latest versions and compatibility.

This article can help you locate the software update mentioned here:

Apple CD-ROM Driver: Support For ATAPI CD-ROM Drives

This article describes the support provided by Apple's CD-ROM driver for ATAPI drives.
This article has been archived and is no longer updated by Apple.
Support for ATAPI CD-ROM drives (such as in the PowerBook 1400) was first introduced in version 5.2 of the Apple CD-ROM driver.

The current version of the Apple CD-ROM driver supports both Apple and industry standard ATAPI CD-ROM drives. Qualified ATAPI version 2.6 compliant drives should have full multimedia support. UDF support has been included in all drivers.

There are CD-ROM drives that do not support all of the ATAPI specification, and therefore cannot be accessed by the Apple CD-ROM driver.

Apple has not tested or qualified any third party drives. Nonetheless, if the drive manufacturer conforms fully to the ATAPI 2.6 standard, it should work.

Macintosh Server G3 Custom Mac OS Information

Your server comes with Mac OS 8.1. It is the same as the retail version of Mac OS 8.1 with the addition of software extensions that enhance the performance and features of your server.

The unique files included with your server are: SoftRAID 2.0.2, Virex 5.8.1, Apple Enet 10/100D extension, and Ethernet (Built In) 2.0.2.

Macintosh Server G3 Bundled Apple and Third-Party Software Information

Mac OS 8.1 for the Macintosh Server G3
AppleShare IP 5.0.2
Apple Network Administrator Toolkit 2.0
Dr. Solomon's Virex 5.8.1 WS
Conley SoftRAID 2.0.2

Please consult documentation that came with your Virex software for support information.

Apple Support Information

Macintosh Server G3 Product's Supported
Apple supports the following bundled software versions in the Macintosh Server G3:

Mac OS 8.1
AppleShare IP 5.0.2
Apple Network Administrator Toolkit 2.0
Conley SoftRAID 2.0.2

Telephone Support

In the United States, if you have questions about your Macintosh Server G3 that are not answered by the provided manuals, call the Apple Assistance Center at 1-800-APL-CARE (1-800-275-2273) during live telephone support hours (Monday through Friday, 6 am to 6 pm Pacific time). After-hours support is provided for critical server issues. When prompted, enter the support access number provided on the back of your Apple Support Card and follow the instructions.

If you are located outside of the United States, refer to the support information that came with your Macintosh Server G3 for instructions.

Web Site

If you have an Internet connection, check the Apple Support Information Web site at **http://www.apple.com/support** for software updates that may become available after the release of this server.

Software License Info

AppleShare IP 5.0.2 that is included with your server has an unlimited user license. The licenses are outlined in the booklet inside the AppleShare IP CD package.

Apple Network Administrator Toolkit 2.0 has a license for 10 computers, whether clients or servers. This applies individually to the software suite of At Ease 5.0, Network Assistant 3.0, and User & Group Manager.

Dr. Solomon's Virex 5.8.1 WS and Conley SoftRAID 2.0.2 have a 1-server license.

Communications Regulation Information

FCC statement

This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in Part 15 of FCC rules. See instructions if interference to radio or television reception is suspected.

Radio and Television interference

The equipment described in this manual generates, uses, and can radiate radio-frequency energy. If it is not installed and used properly--that is, in strict accordance with Apple's instructions--it may cause interference with radio and television reception.

This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in Part 15 of FCC rules. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

You can determine whether your computer system is causing interference by turning it off. If the interference stops, it was probably caused by the computer or one of the peripheral devices.

If your computer system does cause interference to radio or television reception, try to correct the interference by using one or more of the following measures:

- Turn the television or radio antenna until the interference stops.
- Move the computer to one side or the other of the television or radio.
- Move the computer farther away from the television or radio.
- Plug the computer into an outlet that is on a different circuit from the television or radio. (That is, make certain the computer and the television or radio are on circuits controlled by different circuit breakers or fuses.)

If necessary, consult an Apple-authorized service provider or Apple. See the service and support information that came with your Apple product. Or, consult an experienced radio/television technician for additional suggestions.

Important: Changes or modifications to this product not authorized by Apple Computer, Inc., could void the FCC Certification and negate your authority to operate the product.

This product was tested for FCC compliance under conditions that included the use of Apple peripheral devices and Apple shielded cables and connectors between system components. It is important that you use Apple peripheral devices and shielded cables and connectors between system components to reduce the possibility of causing interference to radios, television sets, and other electronic devices. You can obtain Apple peripheral devices and the proper shielded cables and connectors through an Apple-authorized dealer. For non-Apple peripheral devices, contact the manufacturer or dealer for assistance.

Industry Canada statement

This Class B device meets all requirements of the Canadian interference-causing equipment regulations.

Cet appareil numerique de la Class B respecte toutes les exigences du Reglement sur le materiel brouilleur du Canada.

VCCI Class 2 statement

Late Breaking Issues and Known Issues

- The Macintosh Server G3 and Multifunction PCI Cards
  The Macintosh Server G3 provides limited support of multifunction PCI cards.
  A multifunction card is any PCI card which exhibits itself as multiple PCI devices.
  These cards generally contain internal logic which supports the correct distribution of interrupts between virtual devices, however, some cards do not. Please contact your PCI card vendor to verify the card will work with the Macintosh Server G3.
  For additional information and a list of compatible cards, please check the Apple Support Information Web site at http://www.apple.com/support.
- Loss of Ethernet After Installing New Software
  Some software installers inadvertently replace certain extensions with older versions that do not work with this Macintosh Server G3. This frequently occurs with the Ethernet (built-in) extension. If Ethernet is unavailable after installing software, check that the Ethernet (built-in) extension is version 2.0.2 or later. If it is an older version, then reinstall your system software from the system software CD that came with your server.
- Open Transport 1.3.1 and Older Versions of Network Application Software
  The Macintosh Server G3 ships with Mac OS 8.1, which contains version 1.3.1 of Open Transport. Some network software installers inadvertently replace this version of Open Transport with an older version which does not work with the Macintosh Server G3. If networking is unavailable after installing software, check that the Open Transport extension is version 1.3.1 or later. If it is an older version, then reinstall your system software from the system software CD that came with the Macintosh Server G3.
- Booting with a CD-ROM Inserted and DVD
  If you have a DVD CD-ROM drive in your Macintosh Server G3, and you boot from a non-DVD CD-ROM disk, you will need to restart your Macintosh Server G3 to use DVD media. This occurs only when you boot from media which does not contain DVD drivers.
- Headless Server Support
  The Macintosh Server G3 may be configured to function without a monitor attached. To do so, a few instructions must be followed correctly in order for headless operation to work. These instructions are in the Technical Info manual. Additionally, the provided Video Terminator needs to be installed.
  Network Assistant 3.0 is bundled to help remotely administer this server. It is part of the application suite for Apple Network Administrator's Toolkit 2.0.
- Switch Settings for Video Terminator
  Below are the recommended switch settings for the provided video terminator. This video terminator is required to support headless booting. You may wish to change these settings when connecting to a non-Macintosh monitor.

Figure 1, Terminator switch settings

- HFS+ Volumes
  The Macintosh Server G3 hard disk drives are formatted with Macintosh HFS+, Extended Volume Format at the factory. Mac OS Extended Format optimizes the storage capacity of large hard drives by decreasing the minimum size of a single file. As an example, on a 2 GB hard drive a file containing only 2K of information requires 64K of space in Mac OS Standard Format, whereas with the Mac OS Extended Format, it will require the actual 2K on the 2 GB hard drive.
  Existing hard drives formatted with Mac OS Standard Format will continue to function and be supported by Mac OS 8.1. To find out

whether or not a drive was initialized with Mac OS Standard Format or Extended, select the drive, and choose "Get Info" from the File menu.

- Macintosh Server G3 Ultra Wide SCSI Information
  - The Macintosh Server G3 User's Guide states that the Ultra Wide SCSI card is in slot C1, closest to the floor of the computer. In actuality, the card is located in PCI slot A1, nearest the system power supply.
  - External drives do not work on the Ultra Wide SCSI PCI card's 68 pin external connector. A sticker has been placed on the external port to remind you of this limitation. Please do not to remove this sticker. If you plan to use external Ultra Wide SCSI devices, please purchase another Ultra Wide SCSI card and attach external devices to it. Please contact your card vendor for compatibility information with the Macintosh Server G3.
- AppleShare IP 5.0.2 and Mac OS 8.1 Compatibility
  AppleShare IP 5.0.2 ships with your Macintosh Server G3.
  There is a performance update to AppleShare IP 5.0.2 Web and File Server.
  Additionally, the Apple intends to release AppleShare IP 5.0.3 shortly, in order to take full advantage of new Mac OS 8.1 features. When AppleShare IP 5.0.3 is made available, please download this update from the Apple Downloads page.
- Apple Network Administrator Toolkit 2.0 and Mac OS 8.1 Compatibility
  Apple Network Administrator's Toolkit ships with your Macintosh Server G3.
  Apple intends to update At Ease 5.0 and Network Assistant 3.0 for improved compatibility with Mac OS 8.1. Please download these software updates from the Apple Technical Support web site at http://www.apple.com/support.
- Disk Recovery Utilities and Mac OS 8.1
  The Macintosh Server G3 ships with Mac OS 8.1. Due to changes in the file format, specifically the addition of HFS+, many older versions of disk recovery utilities do not work with this version of Mac OS. Please make sure you are running disk recovery utilities which will work with Mac OS 8.1 and HFS+.
- Dr. Solomon's Virex 5.8.1 and the Macintosh Server G3
  The Macintosh Server G3 comes with Virex Virus Detection Software. You will have to install and turn on Virex as well as restart the server for Virex to function.
  You can improve the server's start-up time by enabling SpeedScan and select option to Scan Compressed Files on your server in the Virex Control Panel.
- Apple HD SC80 Hard Drives and Macintosh Server G3
  The Apple HDSC 80 and smaller hard drives do not work with the Macintosh Server G3.
- SoftRAID 2.0.2 and Macintosh Server G3 Issues
  - For optimum performance and data reliability, RAID users should not create a mirror of a stripe volume which spans the same spindles as the stripe volume itself. This changes the volume type within RAID and may cause reliability errors.
  - The Macintosh Server G3 has a limit for the minimum stripe unit block size when Virtual Memory is enabled. This limit is 8 blocks. Setting the stripe unit block size below 8 blocks with Virtual Memory ON will cause the machine to stop responding. If you need to run with a stripe unit size of <8 blocks, turn off Virtual Memory.
- FTP Applications and the Macintosh Server G3
  When downloading data via FTP over 100 Mbit Ethernet, many FTP client applications may appear to hit a limit of 90-95KB/s as a file transfer rate.
  This is caused by the connection buffer size for the client application being too small. While default buffer sizes may vary, you can increase performance by increasing the connection buffer size to 32KB or larger in the corresponding network preference setting. This is known to occur with Fetch and Netscape Navigator. In Navigator, the connection buffer size is in the connections tab of the Network Preferences menu item under the Options menu of your client software.
- Installing Acrobat Reader Software from the System Software CD
  To install Acrobat Reader software on your server

  1. Make sure that Server HD is selected as the startup disk.

  2. Insert the Server System Software CD into your CD-ROM drive.

  3. Open the Adobe Software folder on the CD.

  4. Open the Acrobat Reader 3.0 folder on the CD and follow the installation instructions.
  If your server hard drive is not the startup disk, see the onscreen Mac OS Guide for instructions on how to make Server HD the startup disk.

- Disk Drives Compatible with Soft RAID Software
  For information about compatible disk drives please check the Apple Support web site at <**http://www.apple.com/support**> or contact Conley, the manufacturers of SoftRAID.

Mac OS 8: Resetting Disk Cache

This article tells how to reset the Disk Cache after a clean install of Mac OS 8.0 or 8.1.
This article has been archived and is no longer updated by Apple.
In various configurations, it may be possible for the Memory control panel's Disk Cache setting to be reset to 96K after a clean install of Mac OS 8.0 or 8.1. Having the Disk Cache set this low will adversely impact Mac OS performance.

The Memory control panel has a "Use Defaults" button which will correct this situation. You can accomplish the task in either of these two ways:

Through the Apple menu and the Control Panels folder

1. Pull down the Apple menu (but do not release your mouse button).
2. Highlight the "Control Panels" menu item (but do not release the mouse button).
3. Slide across the "Control Panels" menu item, moving the pointer into the submenu (but do not release the mouse button).
4. In the submenu, highlight the Memory control panel and release the mouse button to open the Memory control panel.
5. Click on the Use Defaults button in the Memory control panel window.
6. Close the Memory control panel.
7. Select Restart from the Special menu.

or

Through the System Folder

1. Open the System Folder on your hard drive.
2. Open the Control Panels folder, which is in the System Folder.
3. Double click on Memory to open the Memory control panel.
4. Click on the Use Defaults button in the Memory control panel window.
5. Close the Memory control panel.
6. Select Restart from the Special menu.

Published Date: Feb 20, 2012

AppleShare IP 5.x: Release History

This article contains an historical look at the AppleShare IP 5.x product line and the purpose of each update release.
This article has been archived and is no longer updated by Apple.

AppleShare IP 5.0 - First Retail Release

AppleShare File service over AppleTalk and TCP/IP,

FTP server

Web server

Mail Server for Post Office Protocol (POP) clients over TCP/IP and AppleTalk.

New administration programs for all of the services

Completely rewritten Print Server.

AppleShare Client v3.7

System Requirements for Running AppleShare IP 5.0

- CPU: Any Apple Power Macintosh computer or Workgroup Server with a PowerPC 601, 604, or 604e microprocessor.
- RAM: 32 MB of memory with virtual memory turned on; 48 MB with virtual memory turned off.
- System Software: 7.6 or later with OpenDoc 1.1.2 or later, except for the Workgroup Server 7350 and the Workgroup Server 9650, which require system software 7.6.1
- Networking Software: Open Transport 1.1.2 or later

System Requirements for Running AppleShare Client 3.7

- System Software: 7.5.3 or later
- Networking Software: Open Transport 1.1.2 or later

AppleShare IP 5.0.1

AppleShare IP 5.0.1 provides minor issue fixes which are only applicable to the Japanese language version of the AppleShare IP server software. An updater is not available for an upgrade to 5.0.1. If you are currently using the English version of AppleShare IP 5.0, there is no need to upgrade to AppleShare 5.0.1.

AppleShare IP 5.0.2

Mac OS 8.0 compatibility

AppleShare Client v3.7.2

Web server plug-in support for Web* API 1.1

Ability to configure ARA user information for Web & File User accounts

Full compatibility with At Ease 5.0 and ARA 2 and 3 personal server
software.

AppleShare IP Mail

- Better behaved with regards to DNS to remove potential delays in mail delivery.
- Much faster performance for user accounts, deleting large messages, and deleting many small messages.
- Supports more than one outgoing SMTP connection.
- There is a new window to check current status of outgoing SMTP connections. Choose the "Show Outgoing SMTP Activity" option from the "Server" menu

Changes to System Requirements for Running AppleShare IP 5.0.2

- System Software: Mac OS 8.0, which includes Open Transport 1.2 and OpenDoc 1.2.1, is strongly recommended. The minimum

requirement is Mac OS 7.6 or later with OpenDoc 1.1.2 or later and Open Transport 1.1.2 or later, except for the Workgroup Server 7350 and the Workgroup Server 9650, which require Mac OS 7.6.1 or later.

Changes to System Requirements for Running AppleShare Client 3.7.2

- None

*Available as an Updater via AppleShare IP web site. Requires AppleShare IP 5.0 to be currently installed on the computer.

AppleShare IP 5.0.3

Mac OS 8.1 compatibility

Macintosh G3 desktop support

AppleShare IP Web & File

- A fix for instances where the web server would stop responding when restarting the system under heavy load.
- A fix for instances where HTTP KeepAlive sessions were not always properly timed-out by the server.

AppleShare IP Mail

- A fix for an issue where delivery of remote mail was delayed under some circumstances. The length and duration of the delay would depend upon the complexity of your TCP/IP network and the load on the AppleShare IP Mail Server.

AppleShare IP Print

- A fix for a "network time out" issue. This would cause random print jobs not to print, mostly on non-Apple printers.
- A fix for an issue where print jobs were sometimes "dropped" on busy servers.
- Better compatibility with PostScript files generated by applications other than Apple laser printers. This fixes issues with printing from many graphics applications.

Changes to System Requirements for Running AppleShare IP 5.0.3

- System Software: MacOS 8.0 or later; MacOS 8.1 recommended. Open Transport 1.2.1 or later.

*Requires AppleShare IP 5.0.2 to be currently installed on the computer.
Published Date: Feb 20, 2012

Mac OS 8.1: PC Setup Sound Issue

I have a Power Macintosh 7300/200 with a PC Compatibility Card installed, running PC Setup 1.6.4 and Mac OS 8.1. When I switch to the PC side I don't get any sound. If the sound source is set to CD, I can hear the audio from the PC.

The sound source didn't have to be set manually in Mac OS 8.1. What is different?

This article has been archived and is no longer updated by Apple.
The sound architecture in Mac OS 8.1 is different from that of previous versions of Mac OS. The sound source must be set to CD to be able to hear PC audio.

PC Setup used to take the setting of the sound source when switching to the PC. When switching back to Mac OS, PC Setup would switch the sound source back to whatever it was. This no longer functions under Mac OS 8.1, so you must manually set the sound source to CD for PC audio to work properly.

Macintosh Server G3: Setting Up For Remote Administration

This article gives instructions on how to set up the original, platinum Macintosh Server G3 for remote administration.
This article has been archived and is no longer updated by Apple.
This is the complete instruction set for setting up your Macintosh Server G3 for headless booting and remote control from an admin workstation.

The basic instructions for setting up the server to run without a monitor are on page 21 of the 'Setting Up Your Macintosh Server' manual. It does not include instructions on installing the Network Assistant software that is required to remotely administer the server. Network Assistant instructions are found on page 43 of the 'Macintosh Server Administrator's Manual.'

Setting Up Your Server to Run Without a Monitor

You can use software such as the Apple Network Administrator Toolkit to run your server remotely from another computer. To run your server without a monitor, you will need to use the video terminator included in the Macintosh Server G3 Accessory Kit.

Step 1: Set Up Your Server

Set up your server, including connecting a monitor, mouse, network cabling, and keyboard.

Be sure network services are operating properly.

Step 2: Install and Set Up Network Assistant On Server As A User Workstation

You need to perform these tasks while sitting at the server; you can't perform them over the network.

Note: For complete instructions on using the Network Assistant software, see Chapter 6 in Install and Set Up and Part 3 in Using Your Software, located in the Electronic Library folder on the Apple Network Administrator Toolkit CD-ROM disc.

1. **Name the Server**
If the workstation hasn't been given a name before you install the software, Network Assistant will automatically generate a name for it. But you might find it easier to recognize and remember the workstation's name later if you give it a name you choose.
To give the workstation a name:
    1. Open the File Sharing control panel
    2. Enter the name in the Computer Name text box.
2. **Install Network Assistant**

    1. On your server, open the Server Extras folder.

    2. Open the Apple Network Admin Toolkit folder.

    3. Open the Workstation Install folder.

    4. Launch the Installer.

    5. Click Continue.

    6. Agree to the Software License.

    7. In the Install ANAT Workstation window, click in the box for Network Assistant Workstation Software.

    8. Click the Install button.

    9. Press Continue to quit all applications.
    The security dialog box appears.

    10. Set Access Privileges [None or Full].

    11. Enter a unique password to access the server remotely. Type that password in the Password field and click OK.

    12. Restart the server.

3. **Setup Access Privileges with Network Assistant Security**
    - To further look at access privileges for the server:
        1. Open Network Administrator Toolkit folder inside Server HD.

        2. Open Network Assistant Security.

3. Type the password you set at installation and click OK.

4. Click to select "Allow administrators to," and then select each privilege you want to have with this workstation.When you select an option, the access privilege takes effect immediately.

- If you want to enter information about the server:

  1. Click the Change Info button in the Network Assistant Security window. The Change Info dialog box appears.

  2. Type the text you want to appear in workstation reports in one or more of the boxes. You can type only one line of text in each box.

  3. Click Change.
  You will be able to see the information you entered in the Network Assistant Security window (on screens with 640 by 480 resolution or better).

4. **Complete the Server Setup**
Once you've set up a workstation, you may want to remove Network Assistant Security as an extra security measure (to prevent users from changing the administrator access privileges you set up). If you need to change the access privileges or password for the workstation later, you can copy the application back onto the workstation from an administrator workstation.
5. **Install The Admin software on a workstation**
Use the Admin Install installer to place the Network Assistant Admin software on a workstation. After all other instructions below are completed, you will be able to control and observe the Macintosh Server G3 from another admin workstation.

Step 3

Turn off the server, then disconnect the monitor.

Step 4

Attach the provided video terminator to the monitor port on the back panel of the server.

Step 5

Turn on the server.

Follow the instructions that came with your remote access software for logging in to and controlling the server.

Note: If you want to connect a monitor at a later time, you must turn off the server before you connect the monitor.

Mac OS 8.1: Can‘t Disable Sound Playthrough From Monitors & Sound

In system software versions previous to Mac OS 8.1, the Monitors & Sound (or Sound) control panel provided a Playthrough checkbox to allow or disallow playing the sound of any audio source through the speakers. This option was typically used to listen to audio CD's. As of Mac OS 8.1, this option is no longer available in the Monitors & Sound control panel. Why was this option removed?
This article has been archived and is no longer updated by Apple.
Every application that utilizes audio input has the responsibility of configuring the sound input driver for use by the user. Unfortunately, there are some applications that rely on the user settings in the Monitors & Sound control panel instead of managing audio themselves. From a technical standpoint, it has become increasingly difficult for Apple to maintain global audio settings through the Monitors & Sound control panel while also allowing "well-behaved" applications to set them up locally.

For this reason, the Monitors & Sound control panel now provides for the selection of a "Sound Monitoring Source". Any audio source chosen from this pop-up menu will always play through the sound output port (internal speakers, external speakers, or headphones).

What implications will this have?

Any application that uses a microphone for sound input should provide options for the user to configure the audio settings. A simple QuickTime dialog can be used if the application is using QuickTime to record sound. If the application does not provide a way for the user to configure audio, the user will have to select Sound In from the Sound Monitoring Source pop-up menu in the Monitors & Sound control panel and the sound from the microphone will play through the speakers. If the volume is too loud, this may cause a feedback loop. In this situation, the user can turn the volume down or plug something into the headphone jack, redirecting the sound from the speakers and preventing the feedback. The same situation will also occur with Apple's PlainTalk Speech Recognition software.

Are there any workarounds?

Any user experiencing this problem with an application should contact the developer and ask that they upgrade the application to offer control of the audio input through QuickTime. In the short term, the user can try turning the system volume down or plug something into the headphone jack to prevent feedback from the microphone from occurring.

Note: The following contains information about software not written by Apple Computer. Apple does not make specific recommendations on third party utilities nor does Apple support or assume liability for any problems incurred by the use of third party applications. The following is merely mentioned for informational purposes as it may serve as a workaround for customers needing to disable playthrough either globally or for specific programs that do not yet offer the ability to disable playthrough.

At the following website, there are a pair of small applications that allow you to toggle the Playthrough status on and off:

http://ic.net/~platkus/ftpsite.html

Apple has received reports that this software is effective.

Chinese Language Kit 2.0: Read Me

This article contains the Read Me document for the Chinese Language Kit version 2.0
This article has been archived and is no longer updated by Apple.

Chinese Language Kit 2.0

Introduction

The Chinese Language Kit (CLK) provides the software you need to enter Chinese characters on your Mac OS computer including Simplified Chinese and Traditional Chinese. This Read Me provides information about the Chinese Language Kit, version 2.0 not contained in the Chinese Language Kit Users Manual.

System Requirements

To install the Chinese Language Kit, you need the amount of hard disk space shown in the table below. To use the Chinese Language Kit, you need at least the amount of Random Access Memory (RAM) shown.

Installed Configuration	Minimum RAM Requirements Normally	Minimum RAM Requirements With GX	Hard Disk Space
Easy Install of Simplified Chinese	12 MB	16 MB	19 MB
Minimum Install of Simplified Chinese	12 MB	16 MB	4 MB
Full Install of Simplified Chinese	12 MB	16 MB	33 MB
Easy Install of Traditional Chinese	12 MB	16 MB	21 MB
Minimum Install of Traditional Chinese	12 MB	16 MB	6 MB
Full Install of Traditional Chinese	12 MB	16 MB	34 MB

The amount of disk space shown is an estimate. The actual amount of disk space required depends on the size of your hard disk and the system software you have installed on your computer.

Installation

You can install several Apple language kits on your Mac OS computer. However, you should install the Chinese Language Kit version 2.0 after you install other language kits that are older than it is, to be sure you have the most recent language kit software installed on your computer.

Chinese Language Kit, version 1.1.1 and version 1.2

Particularly when installing over the Chinese Language Kit versions 1.1.1 and 1.2, you may see a message telling you that the fonts that are already installed are newer than the ones you are about to install. In this case, click Older to install the fonts from Chinese Language Kit 2.0.

Printing With Chinese Characters

Chinese documents you create using the Chinese Language Kit can be printed with a variety of printer drivers. However, you need version 8.4.1 or later of Apple's LaserWriter 8 driver to print Chinese characters to laser printers.

Compatible Application Programs

The Chinese Language Kit can be used with many application programs that use the Apple WorldScript or QuickDraw GX technologies, including applications that are localized for Chinese. If you encounter any application that does not display Chinese characters, contact the appropriate application developer.

The following list includes a few applications that support these technologies:

- HyperCard
- SimpleText, including localized versions
- LightningDraw GX
- Ready, Set, Go GX
- WorldWrite
- NisusWriter
- Netscape, including localized versions
- WordPerfect
- FrameMaker
- Photoshop
- ClarisWorks, including localized versions (see note)

- QuarkExpress, including localized versionsPageMaker, including localized versions

Note: You cannot use Traditional Chinese with ClarisWorks 4.0v5 unless you are using the Chinese Mac OS.

Apple makes no warranties regarding the quality or compatibility of third party products. Warranties, if any, relating to such third party products are between the developers and their customers.

Known Issues

1. Using Simplified Chinese Input Method
If you press Command-Space to choose a keyboard, the Simplified Chinese Input Method may get selected even though you have not selected a Simplified Chinese font to view Finder items.
If you have issues using the Simplified Chinese Input Method, increase the virtual memory setting in the Memory control panel.

2. Printing

If you print a file from a localized application, such as Simplified Chinese SimpleText, the name of the file will appear as "Untitled" in the desktop printer or PrintMonitor window.
The text in some LaserWriter print dialog boxes may not display correctly if you print a document from a localized application, such as Simplified Chinese SimpleText, and your computer has a version of the Mac OS localized for a non-Roman language, such as Japanese.

3. Using with Japanese Mac OS
If you are running the localized Japanese Mac OS 8.0 or 8.1, it includes the LaserWriter TrueType Booster. LaserWriter TrueType Booster is an extension that improves the printing speed of documents with the Chinese Language Kit. This extension may cause your system to stop responding when printing Chinese characters.
To correct this situation you need to update the "LaserWriter TrueType Booster" to version 1.0.1. To update, you must first re-boot with extensions disabled. To do this:

1. Hold the <shift> key down while the system starts up.
2. Go to the "For Japanese Localized Systems" folder on the CD.
3. Drag "LaserWriter TrueType Booster" to your closed System Folder.
A message will ask if it is ok to replace the LaserWriter TrueType Booster with the newer version.
4. Click on "Yes".
5. Restart your system.

4. Using with System 7.6 on 68030 and 68040 machines
If you have issues printing on 68030 and 68040 systems with Mac OS 7.6, you need to do two things. First, run the Mac OS 7.6.1 Update. Second, upgrade the LaserWriter driver to 8.4.1 for your system. Installers for both of these are included on the CD in several of the localized languages in the "Updaters for 7.6" folder. If installers for the language of your system are not on the CD, then please consult your local Apple support site or the Apple Web site at **http://www.apple.com**.

5. Using with Mac OS 7.6 and 7.6.1
If you are using a version of the Mac OS that is earlier than version 8.0 and you have used a Chinese font to display Finder items, the names of items in the Finder that use Chinese characters will not appear if you remove the font. To correct this situation, open the Views control panel and choose a new font from the "Font for views" pop-up menu.

Chinese Language Kit 2.0: About The TrueType Font Editor

This article contains the document titled "About TrueType Font Editor", that is part of the Chinese Language Kit version 2.0.
This article has been archived and is no longer updated by Apple.
Disclaimer: This is an unsupported tool. Apple makes no warranty or representation, expressed or implied, with respect to this program, its quality, performance or fitness for a particular purpose.

About TrueType Font Editor

Known Incompatibilities

When you're using the TrueType Font Editor application, it controls the TrueType fonts installed on your system. If you select another application to use while TrueType Font Editor is open, the fonts in the menu bar and in dialog boxes may not display correctly. If this situation should occur, follow these steps:

1. Open TrueType Font Editor.
2. Select Finder from the Applications menu (right side of the menu bar).
3. Select TrueType Font Editor from the Applications menu.
4. Quit TrueType Font Editor.

If you continue to experience this situation, restart your computer.

You should be able to print fonts you create with the TrueType Font Editor on most LaserWriter printers. However, you may not be able to print the fonts on some printers. If this happens, you may see a message that there is a PostScript error.

Introduction
The TrueType Font Editor lets you create Traditional Chinese and Simplified Chinese characters that you can enter in your documents. These non-standard or customized characters are called gaiji. The name gaiji refers to characters other than the standard 13,000 Traditional Chinese characters and 6,763 Simplified Chinese characters which are already part of the Chinese Language Kit. This document provides brief instructions on how to use the True Type Font Editor version 1.0.2.

Note: You can also create Korean and Roman characters using the TrueType Font Editor.

Overview

The TrueType Font Editor allows you to create new font suitcase files and to copy character outlines out of existing fonts, modify them and then save them in your newly created suitcase files.

The Font View window shows you the contents of a font suitcase file. From this window, you can select characters for editing and also change the code number allocated to each character. In this way you can manage your custom characters as a collection in one window by adding, deleting and arranging the characters according to their code numbers.

The Character Editor window enables you to combine and arrange shapes from any number of source fonts to form a new individual character. When you select a character from any location, a copy is made and shown in the Character Editor window. You do not see or modify the original outline. It is always a copy in the Editor window. In order to preserve the shapes you have edited, the contents of the Character Editor window has to be saved into a font suitcase by you. This is done at any stage of editing by using the Add In Font command from the Character Menu.

The activity of using the TrueType Font Editor falls into three parts:

1. Creating and opening font suitcase files.
2. Selecting fonts and characters within them by typing.
3. Editing the shapes and saving them into your suitcases.

Before You Start

Before creating a font, you need to set the Advance Width in the preference dialog box. This setting affects the size of the character, the position of the character and the distance between the characters.

Figure 1 Preferences

Click on the Use Defaults button. This sets the values shown. However the default values are not suitable for all fonts. For best results, set the value according those in your chosen starting font. To get the value from the existing font, follow these steps:

1. Choose Open from the File menu and open the chosen font file.
2. Choose Preferences from the Edit menu.
3. If necessary, click the TrueType icon on the left side of the dialog box.
4. Note the value of the "Advance width" option.
5. Close the dialog box and the font file.
6. With no windows open, go back to the Preferences window, type in the Advance width value you noted in 4. above and click OK.

Note: The Preferences settings will apply to font files which you create after changing the value. They do not change the values in existing font files.

Character Encoding

Each character you create must have a code number. If you are creating a Traditional Chinese character, it has a Big5 code, which is a hexadecimal number. If you are creating a Simplified Chinese character it has a Quwei code, which is a decimal number. The Big5 and Quwei codes are divided into three ranges for symbols, frequently used characters, and other characters respectively.

When you create a character, the default code number will not always fall in the correct range. The TrueType Font Editor has the ability to edit or overwrite any character in a font, including the existing standard characters. Therefore you must take care in choosing code numbers for your characters. Use the following guidelines to assign a code number to your character.

Traditional Chinese Big5 Code Ranges

The three ranges for the Big5 codes for Traditional Chinese characters are:

1. 1. For symbols, the full range is $A140 to $A3FE. Create new characters in the range $A3C0 to $A3FE.
2. For frequently used characters, the full range is $A440 to $C67E. Create new characters in the range $C6A1 to $C8FE
3. For other characters the full range is $C940 to $F9D5. Create new characters in the range $F9D6 through $FCFE.

Simplified Chinese Quwei Code Ranges

The three ranges for the Quwei codes for Simplified Chinese characters are:

1. For symbols, the full range is 0101 to 1194. Create new characters in the range 1201 to 1594.
2. For frequently used characters, the full range is 1601 to 5589. There is no open space in this range for new characters. Either modify an existing character or create new characters in the ranges for symbols or other characters.
3. For other characters, the full range is 5601 to 8794. Create new characters in the range 8801 to 9294.

Setting up a Font Suitcase File

To create new font suitcase for your collection of custom characters, follow these steps:

1. Choose New Normal Font from the File menu to create a font file. This will show you with the standard Save File dialog in which you must enter a name for the new font suitcase file and choose a folder to save it in. When you have chosen a folder and entered a name, then click Save. In the illustration below, the file has been named "ExampleSuitcase".
Note: Do not save the new font file in the System Folder.

Figure 2 New Font File

2. Clicking Save will take you to the New Font File dialog, shown below. Type a Family Name for your new font and select Traditional Chinese or Simplified Chinese from the Script pop-up menu. Then click OK to save the file to disk. In the screenshot below, the Font Family Name has been entered as "TCFamilyName".
Note: At this point the new empty font file has been created on disk with the Advance Width value you set earlier in the preferences

window.

3. After clicking OK, the Font View window appears, as shown below. From the script you have selected, the application automatically assigns a Family ID number within the correct range. Characters added to the font will appear in the main display area at 24 point size.

Figure 3 ExampleSuitcase

Creating and Designing a Character

To create a new character using the TrueType Font Editor, start by copying an existing Chinese character and then changing it. Typically a Chinese character consists of several radicals, so you might delete one radical of a character and add a radical of another character to it. You can also move radicals that make up the character you are creating.

To create new character in the character editor window, follow these steps:

1. Choose New Character Editor from the Window menu. The Character Editor window appears. The proportions of this window are determined by the four values entered in the Preferences, including the Advance width. If you already have a Chinese font selected the input mode palette will also automatically appear floating next to it, as shown below.

Figure 4 Character Editor 2

2. Choose Show Tool Panel from the Window Menu. The tool palette provides three character editing tools:

Figure 5 Tool Panel palette

- The Select tool lets you select parts of a character in the window so that you can copy, delete, or move it.
- The Zoom tool lets you zoom in and out. Hold the Option key down to zoom out.
- The Scale tool lets you change the size of a radical.

3. Choose a font from the Select Font Template item in the Character menu.
You will use one or more characters of this font as the template for the character you are creating. Choose a Traditional Chinese font if you are creating a Traditional Chinese character. Choose a Simplified Chinese font if you are creating a Simplified Chinese character.
For example: With Traditional Chinese you could choose Apple LiSung Light or Apple LiGothic Medium. With Simplified Chinese you could choose Kai or Song.

4. Enter a character in the Character Editor window.

5. Choose an input method from the Keyboard menu and an input mode from the Pencil menu. For example, choose Pinyin to create a Traditional Chinese character or ABC Standard to create a Simplified Chinese character. You must also select a Traditional or Simplified Chinese font from the font menu in order to be able to select a character correctly.

6. Press the keys to enter the character you want to start with then press the Space bar. Select the character in the selection palette and press return. The character now appears in the Character Editor window.

Figure 6 Character Editor 3
Note: See the Chinese Language Kit Manual for detailed instructions on using the various Chinese input methods.

7. Enter additional characters in the Character Editor window.
If you want to combine radicals from two or more characters, you can enter more than one character in the same Character Editor window. The characters will superimpose on top of each other aligned at their bottom left corners, as shown below. You must then edit and re-position the shapes as required to form your new character.

8. Create Multiple Character Editor windows
Alternatively, you can create separate Character Editor windows for each source character and then cut, copy and paste between them to do the editing. Do this by selecting New Character Editor from the Window menu for each character you need.

Figure 7 Character Editor 3

9. Zooming in
Select the Magnification tool then click in the Character Editor window to zoom in. Hold down the Option key and click to zoom out. (Use the scroll bars to adjust your view when zoomed in.)
10. Selecting and editing parts with the Selection and Scale tools.
You are now ready to change the character. Here are some ideas of what you can do:

- Double-click to select a radical of a character, then choose Clear from the Edit menu to remove the radical from the character.
- In another Character Editor window, double-click to select a radical then choose Copy from the Edit menu. Switch to the first Character Editor window and choose Paste from the Edit menu to add the radical to the character you are creating.
- Double-click to select a radical, then drag to move it.
- Double-click to select a radical, then select the Scale tool. Drag to make the radical larger or smaller.

The example below shows combining of parts from previous two screens. The upper grass radical cao-zi-tou has been moved up from its starting position.

Figure 8 Suitcases

Saving a Character to a Font Suitcase

To save the character you have created in the character editor window, follow these steps:

1. To add the character to a font, select Add In Font from the Character Menu. In the file selection dialog box that appears, select the font suitcase file you created and click Open.

Figure 9 ExampleSuitcase
The Font View window for the selected file will then appear, including the newly added character, as shown below:

Figure 10 Character Code

2. You now need to check the code for the new character. Click the button at the bottom of the font view window called Change Selected Character Code. This will take you to the Character Code window.

Figure 11 Warning dialog

3. Compare the value in the dialog to the code ranges given in "Character Encoding" earlier in this document. If the default code value is within the appropriate range, then click OK. If it is not, then type in an appropriate value. When you're finished, click OK.
TrueType Font Editor checks the code value you have given with any other characters you have created and stored in the same font suitecase file. If there is a conflict with an existing character, you will be warned that the code is already in use.

Figure 12 Save Changes dialog
Either choose to replace the older character with the one you have just given the code value to, or cancel to go back and enter another non-conflicting code value.
You can now create other characters or you can quit from the TrueType Font Editor.

4. Choose Save from the File menu to save the font in the file. If you forget to save, you will be reminded when you close the Font View window or quit the application.

Preparing to Use Your Character

To enter the character you have created in a document:

1. Locate the font file you created.

2. Drag it to the System Folder. A message asks you if you want to place the file in the Fonts folder.

3. Click OK.

4. You must now restart your workstation.

When your computer starts up, you can enter the character in a document. See the chapter in the Chinese Language Kit User's Manual for the input method you are using for instructions on entering the character.

Working with a Collection of characters in a suitcase file

As you create new characters by using Add In Font from the Character Menu, your font suitcase file will gradually accumulate characters. These will be displayed, arranged in ascending code value order, at 24 point size in the main area of the Font View window.

Figure 13 ExampleSuitcase

- Click to select a character in the window. The character will be highlighted and its character code will be displayed at the bottom of the screen in Hexadecimal and Decimal notation.
- Change the relative position of characters in your collection by using Change Selected Character Code as described earlier.
- To be able to make further modifications, either double-click on a character or click to select it and then click on Export Selected Character. This will create a new Character Editor window and copy the character to it. When you Add it back into the Font Suitcase file, it will be automatically added to the collection as a new character, leaving the original intact.
- To delete a character from the collection, click on it to select it and then choose Clear from the Edit menu. Alternatively overwrite the character by changing the character code of another character to be equal to it.

Mac OS 8: System File Damage

With Mac OS 8.1 installed, when I double-click the System suitcase, the Finder displays an error message stating that the file is damaged.

This article has been archived and is no longer updated by Apple.

Symptom

With Mac OS 8.1 installed, when I double-click the System suitcase, the Finder displays an error message stating that the file is damaged.

This is caused by having Appearance Extension version 1.0.2 installed. Mac OS 8.1 installs version 1.0.1 and Mac OS 8.0 installs version 1.0. It is important to note that the System suitcase is not damaged.

Solution

If you need to add or remove items from the System suitcase, you can do this by using the following workaround.

1. Option-drag the System file to the desktop.
2. Open the copy you just made and make the changes.
3. Close the window for the copy.
4. Drag the System suitcase from the System Folder to the Trash.
5. Drag the copy from the desktop to the System Folder.
6. Make sure the System Folder is blessed by making sure the System Folder icon has the Mac OS logo on it.
7. Restart the computer.
8. Empty the Trash to delete the old System suitcase.

QuickTime 3: Choosing A PPD In Desktop Printer Utility

Since I installed QuickTime 3 for the Macintosh, whenever I try to create a desktop printer using the Desktop Printer Utility and select a PPD file, I get a dialog asking to select either "Desktop Printer Utility with QuickTime translation" or "Desktop Printer Utility." Can you explain and offer a solution?

This article has been archived and is no longer updated by Apple.

Because of the new way in which QuickTime 3 checks for media files, this dialog will appear the first time you select a PPD with the Desktop Printer Utility. Proceed by selecting "Desktop Printer Utility" in the dialog box. After making this selection once, Mac OS Easy Open remembers your preference and won't present the dialog in the future.

If you receive an error stating "The document cannot be translated because an unexpected problem has occurred (-2048)" then you probably selected "Desktop Printer Utility with QuickTime translation" instead of "Desktop Printer Utility". To correct this, open the Mac OS Easy Open control panel and click the Delete Preferences button. Then select the PPD and this time choose "Desktop Printer Utility" from the dialog box.

Mac OS 8.1: Daylight Saving Time & Mac OS Extended Volumes

Using Mac OS 8.1 on a Mac OS Extended hard disk with Daylight Saving Time selected in the Date & Time control panel, both the creation and modification times of files change by one hour. However, when using Mac OS 8.1 on a Mac OS Standard format hard disk, the times do not change.
This article has been archived and is no longer updated by Apple.
The reason the times change is that Mac OS Extended format stores the creation and modification times in Greenwich Mean Time (GMT). This time is also known as Universal Time (UTC). The offset from GMT is stored in PRAM. This value is added to the time stored for the file to determine the correct creation or modification time.

The GMT offset is stored when you select a time zone in the Date & Time control panel. This offset is modified when Daylight Saving Time is checked. Since the value is stored as seconds, 3600 is either added to or subtracted from the GMT offset depending on whether entering or exiting Daylight Saving Time.

For example, a file was created at 12:00 PM Pacific Standard Time. The value stored was 8:00 PM GMT since there is an 8 hour difference. When Daylight Saving Time is in effect, the difference is only 7 hours. This causes the creation time of the file to be displayed as 1:00 PM PST, not 12:00 PM.

Changing time zones also affects the creation and modification dates.

Drawbacks of this are that aliases may break, and backups may be effected.

Note: This issue has been addressed in Mac OS 8.5 and later and no longer occurs.

AppleShare IP: Retaining File & Folder Permissions After Clean Install

This article describes how to perform a clean system install of the Mac OS on an AppleShare IP server while preserving file and folder privileges. This article has been archived and is no longer updated by Apple.

Introduction

This procedure will work on Workgroup Servers and other Macintosh computers running AppleShare IP. This will not cure issues due to a damaged Users & Groups Data File or AppleShare PDS file. This is the procedure to use if your system software on a Mac OS AppleShare server has become unusable, and you want to replace it while preserving privileges and sharing information.

Note: Before proceeding with Step 1, ensure that you have a backup of your file server that can be used for recovery purposes. Many times, backup servers may be used to test the quality of a file server backup to ensure recoverability.

To backup your file server properly, the AppleShare server software must be active to retain users, groups, permissions and sharepoints.

Step 1: Startup from the Mac OS CD-ROM.

1. Start up with the "Workgroup Server Software" CD-ROM disc that came with your Workgroup Server, or a bootable Mac OS CD that contains Mac OS 7.6 or later. For full information on compatibility between versions of AppleShare and Mac OS, see the following article:
Article 16145: "**AppleShare: Platforms & Mac OS Releases Supported**"
You can force the machine to start up from the CD by pressing and holding the "c" key after restarting until you see the "Welcome To Macintosh" screen. You should see a desktop pattern with CDs flying in the background. At the desktop, the CD-ROM's icon should be in the upper-right corner of your screen; your hard drive's icon should be below it. If a hard drive appears above the icon for the CD-ROM, open the Startup Disk control panel, and select the CD-ROM. Close all open windows and restart the computer. The CD-ROM icon should now appear in the upper-right corner above any other drives that show up on the desktop.
2. Run Disk First Aid (in the "Utilities" folder on the CD) and repair any problems found. If Disk First Aid cannot repair the drive, you should back up your data, format the drive, and then restore the data.

Warning: Be sure to back up data **before** formatting a drive because all data will be lost during the formatting process.

Step 2: Start Clean Install

If you are installing Mac OS 7.6 or 7.6.1

1. Step through the four-step installation process until you get to the screen entitled "Software Installation."
2. Click the "Options" button at the bottom of the screen.
3. In the window that appears, click the checkbox next to "Create new System Folder."
4. Click "OK".

If you are installing Mac OS 8.x

1. After you get the welcome screen, click "Continue." The next screen should say "Select Destination."
2. For Mac OS 8.0 and 8.1, click the checkbox at the bottom of the screen to select "Perform Clean Installation."
3. For Mac OS 8.5 or 8.6, click the Options button to find the Clean Install option.
The Installer should walk you through the rest of the installation.

After the clean installation is complete, install any supported Mac OS Updates.

Step 3: Set up the File Sharing information

When the installation is finished, restart the computer normally so that it restarts from the hard drive. If you get a dialog box from the Energy Saver Control panel, be sure to set the preferences to never spin down the hard drive or put the computer to sleep.

If you have Mac OS 7.6

If you are installing 7.6, open the Sharing Setup control panel and fill out the Owner Name, the Owner Password, and the Machine name. Make careful note of the exact Owner Name and Owner Password you enter. Later on these will be the AppleShare Administrator name and password.

If you have Mac OS 8.x

The Mac OS Setup Assistant should launch when you start up. Complete that. Make careful note of your answers to the questions "What is your Name" and "What password would you like to use on your computer?" Later, this will be the AppleShare Administrator name and password. When the setup assistant asks you if you want to share a folder on this computer, select "No."

Step 4: Move the old User & Group Data File to the new System Folder

Open the System Folder, and inside the System Folder open the Preferences folder. Drag the Users & Groups Data File to the Trash. Close the Preferences folder.

Locate the folder named Previous System Folder and open it, then open the Preferences folder. While pressing and holding the Option key on your keyboard, drag the Users & Groups Data File to the desktop. (Holding down the Option key will let you copy the Users & Groups Data File instead of moving it.) Close the Preferences folder and the Previous System Folder.

The System Folder should still be open (if it is not, open it). Drag the Users & Groups Data File from the desktop to the Preferences folder of the open System Folder.

Step 5: Install ASIP

Restart and install AppleShare IP Software. Be sure to install any necessary updates prior to launching the AppleShare IP Easy Setup. Restart the computer.

Step 6: Run Easy Setup

Run AppleShare IP Easy Setup. It should detect your serial number from the previous Users & Groups Data File. Once you finish walking through Easy Setup, your server should be running with the previous user list and access privileges.

PowerBook G3, PowerBook G3 Series: No Contrast Control

This article explains how to adjust the display on a PowerBook G3 or PowerBook G3 Series computer.
This article has been archived and is no longer updated by Apple.
The PowerBook G3 and G3 Series computers have a fixed-contrast liquid crystal display like the PowerBook 2400. You cannot change the contrast on these displays.

You can, however, make some adjustments to the display by using ColorSync:

1. Install the latest version of ColorSync.
This article can help you locate the software update mentioned here:
Article 14724: "**Where To Find Apple Software Updates**" - Lists online services for free Apple software updates.

2. Open the Monitors and Sound control panel and click the Color button. On the bottom of the window you will see a list of ColorSync Profiles and a Calibrate button.

3. Click the button to launch the Apple Monitor Calibration Assistant.

4. Walk through this series of adjustments until you get the screen the way you want it. Disregard the contrast setting instruction, but experiment with the other settings. The Target Gamma page will probably provide you with a contrast setting that will satisfy you.

5. Save the setting and you will return to the list of profiles.

6. Select the new one and you are done.

You can make multiple calibrations and create a choice of various settings for use in different applications or environmental settings.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Mac OS 8: Cannot Launch Apple Video Player or FM Radio

This article explains an error message that may appear when trying to use Apple Video Player or Apple FM Radio after upgrading to Mac OS 8.x.
This article has been archived and is no longer updated by Apple.

Symptom

After upgrading to Mac OS 8.x, some users of Apple Video Player or Apple FM Radio will receive an error message saying they need the proper version of these applications or that the Video Startup extension did not load.

Solution

Background

Prior to Mac OS 8, the Apple Video Player and the Apple FM Radio programs were stored in the "Apple Extras Folder" which is at the root level of the hard drive. However, Mac OS 8 installs both of those applications in the "Applications" folder (also at the root level of the hard drive). Either way, there are aliases to those programs stored in the "Apple Menu Items" folder (which resides in the System Folder) and that is how they are displayed under the Apple Menu.

How The Situation Can Occur

If you have a version of the Mac OS prior to 8.0, and then you install Mac OS 8.x on top of that, the Mac OS 8.x Installer will add the updated FM Radio and Apple Video Player applications, but it may not update those aliases in the Apple Menu Items. So, after installing Mac OS 8.x, you will have the older versions of those applications in the "Apple Extras" folder and you will have the new Mac OS 8.x compatible versions of those applications in the "Applications" folder. However, since the aliases under the Apple Menu are pointing to the old versions of those programs, it tries to launch those and you get the error messages.

To resolve this issue, perform the following steps:

1. Open the Apple Menu Items folder (located in the System Folder).
2. Drag the "Apple Video Player" and "Apple FM Radio" aliases to the Trash.
3. Open the Applications folder (root level of the hard drive).
4. Make aliases for the Apple FM Radio program and the Apple Video Player.
5. Drag those new aliases to the Apple Menu Items folder.

At this point you should be able to launch both applications from the Apple Menu.

Please note that the Mac OS 8.1 Installer will **not** install the updated versions of these applications if the older versions are not already installed. For more on this issue, please see the following article:

Article 22141: "**Mac OS 8.1: FM Radio Installation Issues & Version Error**"

For information on what versions of Apple Video Player and FM Radio are installed by the various different versions of the OS, please see the following article:

PowerBook G3 Series: Description

This article provides a description of Macintosh PowerBook G3 Series computers.
This article has been archived and is no longer updated by Apple.
Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

The Apple Macintosh PowerBook G3 Series sets new standards for portable design and performance. At first glance, you'll be struck by the extreme elegance of these computers. On closer examination, you'll find their advanced features and outstanding flexibility even more striking. Most impressive of all, though, is their performance. These innovative notebook systems outperform comparable Pentium and Pentium II processor-based notebook and desktop systems.*

The Macintosh PowerBook G3 Series truly offers "something for everyone"-- from creative professionals to educators and students to business professionals. Built around the high-performance PowerPC G3 processor-- the same innovative chip that sparked the success of Apple's current line of desktop systems--these notebook systems provide the power to handle even the most demanding tasks.

To complement their power, the PowerBook G3 computers incorporate the impressive multimedia capabilities that are a must for today's educators and professionals. And since Apple understands that individual needs are just that--individual--these systems offer flexible configuration options. Each system includes a high-speed CD-ROM drive and supports the latest storage technology--DVD-ROM. They also include built-in video output, and several configurations include S-video output for connecting to a TV.

The innovative design of these computers is as functional as it is attractive, with features such as two hot-swappable expansion bays for multiple storage options and lithium-ion batteries, and a flip-up keyboard for fast, easy access to the RAM expansion slot and removable hard disk drive.

The PowerBook G3 computers' communications offerings include built-in Ethernet--a requirement in most educational environments as well as in business. An optional K56flex modem lets you tap into your organizational network or the Internet.**

The Macintosh PowerBook G3 Series: Truly customizable portable systems that give you unmatched performance and capabilities to meet your needs at a price you can afford.

Features

Astounding performance at affordable prices

- Features the PowerPC G3 processor, for the fastest performance ever in a notebook computer
- Incorporates performance-boosting backside level 2 cache**
- Uses SDRAM and SGRAM for the fastest memory architecture available
- Supports two lithium-ion batteries for up to 7 hours of normal use
- Offers flexible configuration options to meet your needs and your budget

Advanced multimedia capabilities

- Features a high-quality display--up to 14.1 inches (diagonal)
- Includes up to 4MB of video memory, for displaying millions of colors on an external monitor
- Provides outstanding 2D/3D graphics acceleration through an integrated controller
- Includes a high-speed CD-ROM drive and supports the latest performance breakthrough in storage--DVD-ROM
- Allows you to connect an external monitor, video projector, or TV**

Striking style and stellar efficiency

- Combines aesthetics and ergonomics to create an elegantly efficient system
- Includes two expansion bays for a variety of storage and battery options
- Provides easy access to the memory expansion slot and removable hard disk drive through its flip-up keyboard
- Accommodates CardBus cards and PC Cards for additional networking, storage, and modem capabilities

Integrated communications

- Includes built-in 10BASE-T Ethernet
- Accommodates K56flex technology for the ultimate in modem connectivity**
- Comes with built-in 4-Mbps IrDA technology for easy, wireless LAN access and file sharing

Macintosh PowerBook Performance Comparisons

Figure 1 Graph

Notes
*Based on BYTEmark integer index.
**Available in some configurations; see Configurations chart for product details.
***Based on Apple internal testing using MacBench 4.0 processor performance scores. Actual performance on applications will vary. MacBench is a subsystem-level benchmark that measures the relative performance of Mac OS-based systems.

Ordering Information

For detailed information about configurations, see the chart below. All models also include a built-in keyboard and trackpad; all necessary cables, such as an Ethernet cable, modem cable, composite to S-video adapter and VGA-to-Macintosh connector cable; Mac OS 8.1 (which includes Internet access software); third-party software titles (FAXstf, Now Contact & Up*to*Date, and WebWhacker); complete setup, learning, and reference documentation; and limited warranty.

Build-to-order (BTO) options

These systems can also be ordered through the online Apple Store, which allows you to custom-configure your computer in such areas as processor speed, display size, RAM, hard disk size, modem, and expansion bay modules such as a DVD-ROM drive and lithium-ion battery.

LaserWriter And LaserWriter Plus: Port Illustration

This article contains a picture of the communication ports on LaserWriter and LaserWriter Plus printers, along with information on the ports' capabilities.
This article has been archived and is no longer updated by Apple.

Figure 1 Ports

The 9-pin socket supports an AppleTalk connection with the Apple Locking LocalTalk Connector Kit. The four position rotary mode switch must be set to the "AppleTalk" position in order to communicate with a Mac OS compatible computer. Serial communications to a DOS/Windows compatible computer can be achieved by selecting either 1200 or 9600 on the rotary switch.

The 25-pin socket will allow for RS-232c serial communication to a DOS compatible computer. It does not allow communication with a Mac OS compatible computer.

The LaserWriter and LaserWriter Plus do not support simultaneous communications.

Personal LaserWriter Series: Port Illustrations

This article contains pictures of the communication ports on Personal LaserWriter series printers, along with information on the ports' capabilities. The following models are included:

- Personal LaserWriter SC
- Personal LaserWriter LS
- Personal LaserWriter NT
- Peronsal LaserWriter 300
- Personal LaserWriter 320
- Personal LaserWriter 4/600PS

This article has been archived and is no longer updated by Apple.

Personal LaserWriter SC

There are two SCSI connections on the rear of the printer; they are not parallel connectors. The Personal LaserWriter SC communicates with a Mac OS compatible computer via SCSI and follows standard SCSI rules. If it is the only SCSI device connected, one port must be terminated, while the other port accepts the SCSI cable that goes to the computer. (The ports are the same; it does not matter which port gets the terminator and which gets the cable.) There is no support for printing to a DOS/Windows compatible computer.

Personal LaserWriter LS

The mini DIN-8 connection supports serial communication **only** with a Mac OS compatible computer via a serial Peripheral 8 cable. AppleTalk is not an option with the Personal LaserWriter LS. There is no support for communication with DOS/Windows compatible computers.

Personal LaserWriter NT

The mini DIN-8 connection supports AppleTalk communication with Mac OS compatible computers via LocalTalk connectors.

The The 25-pin socket will allow for RS-232c serial communication with a DOS compatible computer. This is not compatible for communication with a Mac OS compatible computer. The pushwheel switch determines what rate the serial communication will be and what protocols they will follow. This is not a SCSI ID number.

Personal LaserWriter 300

The mini DIN-8 connection supports serial communication **only** with a Mac OS compatible computer via a serial Peripheral 8 cable. AppleTalk is not an option with the Personal LaserWriter 300. There is no support for communication with DOS/Windows compatible computers.

Personal LaserWriter 320 and LaserWriter 4/600

The Personal LaserWriter 320 and LaserWriter 4/600 support only AppleTalk connections to the mini DIN-8 port with LocalTalk connectors. There is no support for printing to DOS/Windows compatible computers.

LaserWriter II Series: Port Illustrations

This article contains pictures of the communication ports on LaserWriter II series printers, along with information on the ports' capabilities. The following models are included:

- LaserWriter IISC
- LaserWriter IINT
- LaserWriter IINTX
- LaserWriter IIf
- LaserWriter IIg

This article has been archived and is no longer updated by Apple.

LaserWriter IISC

There are two SCSI connections on the rear of the printer; they are not parallel connectors. The LaserWriter IISC communicates with a Mac OS compatible computer via SCSI and follows standard SCSI rules. If it is the only SCSI device connected, one port must be terminated, while the other port accepts the SCSI cable that goes to the computer. (The ports are the same; it does not matter which port gets the terminator and which gets the cable.) There is no support for printing to a DOS/Windows compatible computer.

LaserWriter IINT

The Apple Desktop Bus (ADB) connector is not used on this printer. The 25-pin connection allows serial communication with a DOS/Windows computer; you can change communication rates and protocols via the Switch Bank. The mini DIN-8 connector allows AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. This printer does not support simultaneous communications.

LaserWriter IINTX

The Apple Desktop Bus (ADB) connector is not used on this printer. The 25-pin connection allows serial communication with a DOS/Windows computer; you can change communication rates and protocols via the Switch Bank. The mini DIN-8 connector allows AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. The SCSI connector is used for external hard drives to store downloaded font files; the SCSI connector is **not** used for SCSI printing directly from a Macintosh. This printer does not support simultaneous communications.

LaserWriter IIf

The LaserWriter IIf supports AppleTalk connections through the mini DIN-8 port to Mac OS compatible computers via LocalTalk connectors. The 25-pin port supports serial communication with DOS/Windows computers. The push button switch is used to change the communication rates and protocols for only the 25-pin port. The SCSI connector is used for external hard drives to store downloaded font files; the SCSI connector is **not** used for SCSI printing directly from a Macintosh. This printer does support simultaneous communications.

LaserWriter IIg

The LaserWriter IIg supports AppleTalk connections through the mini DIN-8 port to Mac OS compatible computers via LocalTalk connectors. The Ethernet connection supports Ethernet communication via an AUI-15 connection with transceiver. The 25-pin port supports serial communication with DOS/Windows computers. The push button switch is used to change the communication rates and protocols for only the 25-pin port. The SCSI connector is used for external hard drives to store downloaded font files; the SCSI connector is **not** used for SCSI printing directly from a Macintosh. This printer does support simultaneous communications.

- LaserWriter Pro 600
- LaserWriter Pro 630
- LaserWriter 12/640PS
- LaserWriter 16/600PS
- LaserWriter 8500
- LaserWriter Pro 810

This article has been archived and is no longer updated by Apple.

LaserWriter Pro 600

The mini DIN-8 connection supports AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. The 9-pin connector supports serial communication with DOS/Windows computers. The configuration switch allows you to change communication rates and protocols. The Centronics (parallel) port allows for parallel printing from DOS/Windows computers. All ports are active which allows for simultaneous communications.

LaserWriter Pro 630

The mini DIN-8 connection supports AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. The 9-pin connector supports serial communication with DOS/Windows computers. The configuration switch allows you to change communication rates and protocols. The Centronics (parallel) port allows for parallel printing from DOS/Windows computers. The Ethernet connection supports Ethernet communication via an AUI-15 connection with transceiver. The HDI-30 connection supports a SCSI hard drive used for font storage. All ports are active which allows for simultaneous communications.

LaserWriter 12/640PS

The mini DIN-8 connection supports AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. The Communication Switch allows you to change communication rates and protocols. The IEEE-1284 Bi-Directional Centronics (parallel) port allows for parallel printing from DOS/Windows computers. The Ethernet port supports Ethernet communication via an AUI-15 connection with transceiver. All ports are active which allows for simultaneous communications.

LaserWriter 16/600PS

The mini DIN-8 connection supports AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. The configuration switch allows you to change communication rates and protocols. The Centronics (parallel) port allows for parallel printing from DOS/Windows computers. The Ethernet connection supports Ethernet communication via an AUI-15 connection with transceiver. The HDI-30 connection supports a SCSI hard drive used for font storage. The RJ-11 port is present if the optional LaserWriter 16/600 PS Fax Card is installed. All ports are active which allows for simultaneous communications.

LaserWriter 8500

The mini DIN-8 connection supports AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. The Communication Switch allows you to change communication rates and protocols. The IEEE-1284 Bi-Directional Centronics (parallel) port allows for parallel printing from DOS/Windows computers. The Ethernet connection supports Ethernet communication via an AAUI-15 connection with transceiver or the RJ-45 connection. You can only use one Ethernet port at a time, not both simultaneously. The SCSI connector allows for connection of an external hard drive for font storage.

LaserWriter Pro 810

The mini DIN-8 connection supports AppleTalk communication with Mac OS compatible computers via LocalTalk connectors. The 9-pin connector supports serial communication with DOS/Windows computers. The Ethernet connections support Ethernet communication via two RJ-45 connections. The 25-pin SCSI connection supports a SCSI hard drive used for font storage. All ports are active which allows for simultaneous communications.

FAXstf: Not Picking Up Fax Phone Calls

Summary:
The FAXstf fax software, installed in some Macintosh configurations, is not picking up the phone line, so faxes cannot be received.
This article has been archived and is no longer updated by Apple.
Apple bundled FAXstf on a number of systems, including desktop Power Macintosh G3 and PowerBook G3 systems . FAXstf is a product of Smith Micro Software-- **not** Apple Computer and all technical support related issues are handled by Smith Micro Software, Inc. However, one common issue is listed below.

Issue:
Occasionally, the modem goes into data mode instead of the idle (fax) mode. When this happens, the modem no longer answers an incoming fax call.

To check what mode the modem is in:

1. Select "Fax Status" in the Apple Menu.
A window is displayed with a Macintosh icon on the right side. Below the Macintosh icon is text that states "Data Mode" or "Idle".
2. On the right side of the window a Macintosh icon is displayed with text below reading "Data Mode" or "Idle". If it is set to Data mode you must reset the FAXstf Answer On settings.

Resetting the Answer On settings:

1. Open the FAXstf folder.
2. Open Fax Settings (older versions) or
Open Fax Browser (later versions)
3. Choose settings from the Edit menu.
4. Choose Fax Modem.
5. In the "Answer On" option change it to "Never".
6. Click Done.
7. Reopen the settings and change the "Answer On" selection back to one, two, or more rings (your preference).

At this point the modem should say "Idle" in the Fax Status and is ready to answer a call.

If the modem still does not answer the fax but works correctly in other applications, contact Smith Micro Software, the publisher of FAXstf software. Apple has documented this issue with STF Technologies (the previous owners of FAXstf). Smith Micro Software may have a newer version of the software that addresses the issue.

56Kbps Modems: Getting The Fastest Connection

My 56K modem is not connecting at the speed I expected. I understand that regulations in North America and some other countries limit connections to 53 kilobits per second, but my modem seldom connects at greater than 36 Kbps. Is it malfunctioning? Can anything be done?
This article has been archived and is no longer updated by Apple.
A modem is unlikely to malfunction only to the extent that it is unable to achieve its top speeds. Lesser speeds are common and generally reflect limitations imposed by the operating conditions:

- Impairments in the telephone network path
- Interoperability issues between modems
- Modem settings

This article provides an overview of these conditions as they affect the connection speed and reliability of 56K modems, though much is equally relevant to other modems. It joins a large body of complementary material available online from many modem manufacturers and modem-related web pages.

But first, just how fast is that connection?

MEASURING CONNECTION SPEED

Initial connection speed. The PPP or Remote Access control panel (see Figure 1) shows the speed initially established, not the current or average connection speed, which often differs.

Figure 1: Remote Access, showing an initial connection speed of 40000 bits per second (40 Kbps)

If operating conditions permit a faster connection, the modem will attempt to speed up (fall forward). If conditions prevent sustaining a speed without incurring excessive transmission errors, the modem will slow down (fall back). Because these adjustments are common but not reflected in the software, do not base performance measurements solely upon initial connection speed.

DTE speed (modem-to-computer speed or port speed) is generally represented by the static numbers 38400, 57600, or 115200, as configured in the software. It is not a measurement of connection speed. The ARA modem scripts (selected in the Modem control panel) for all Apple 56K modems correctly configure the DTE speed for a maximum of 115200 bps.

Determining the average Data Transfer Rate. Data Transfer Rate (DTR), or throughput, describes how fast data is being transferred, expressed in bits per second. The following method of obtaining the average DTR is a truer method of assessing modem performance than observing the initial connection speed or the fluctuating throughput indicators of web browsers or FTP clients. Because the upload (transmit) speeds of analog modems cannot exceed 33.6K, the discussion is confined to download (receive) speeds.

1. Connect to the internet and, preferably, open an FTP client application rather than a web browser. Anarchie, Fetch, NetFinder, and Vicomsoft FTP Client are popular shareware examples.

2. Log in to an FTP server. Many Internet Service Providers make local FTP servers available for their members, and most FTP clients include a selection of public FTP server bookmarks. If you know of any FTP servers that are not very busy or are geographically nearby, use them. The more frequently the modem has to wait for a busy server to respond, the less accurate the test results will be. The greater the server's distance, the more likely the connection will pass through additional line impairments that may slow the connection.

3. Download a compressed file of approximately 500K or larger. Most compressed files have a file name extension of .sit, .sea, .cpt, or .zip. Apply the formula **file size (bytes)/download time (seconds) x 9 = average DTR (bits/second)**, as shown:

Figure 2: Formula for computing the average Data Transfer Rate

Example
For a 500K file that takes 2 minutes 5 seconds to complete downloading, the equation reads:

500,000 / 125 x 9 = 36,000

The average DTR was 36K (kilobits, not kilobytes) per second, though the actual DTR at any moment may have been higher or lower.

About File Size
The file sizes shown in FTP client windows are generally approximate. Convert kilobytes to bytes using the decimal format appropriate to measuring data transfer rates, where 1K = 1,000 bytes. To convert the average DTR from bits per second to kilobits per second, always divide the result by 1,000.

About Download Time
The FTP client's download progress indicator may appear shortly before the file begins downloading. Do not begin timing until the download appears to be underway. Use your own timer instead of relying upon any download time that may be reported by the FTP client.

Why the Formula Is Not Perfect
Average DTR will be greater than calculated when transmission errors require data to be re-sent, thus increasing download time without changing file size. And if the modem negotiates a connection requiring start and stop bits (2 bits added to the baseline 8 bits per byte), DTR will be greater by an additional 1 bit per byte transferred. Because all connections require transmission of some amount of extra data, using 9 as the third variable in the formula provides a serviceable if not always entirely accurate compromise.

4. Disconnect, then repeat the procedure using different FTP servers at different times of the day, especially during the off-hours of early morning or late evening. The averaged results best represent what the modem is able to achieve under its current operating conditions, so look for improvement by making the operating conditions more suitable for faster connections.

OPERATING CONDITIONS AFFECTING CONNECTION SPEED & RELIABILITY

Impairments in the telephone network path

1. Multiple analog/digital conversions. Connections are limited to a maximum of 33.6 Kbps where more than one analog section exists in the telephone network path between modems. The first analog section begins with your modem. Internet Service Providers fully supporting 56K modem connections must provide a completely digital connection, but additional analog sections may be introduced elsewhere in the path.

What you can do
Nothing. The telephone company can confirm the presence of multiple A/D conversions in a path, but consider that no two calls are necessarily routed through the same path, even when dialing the same number. This is one reason why throughput can vary with each connection. There is always the hope that the telephone network in your area will be upgraded.

2. Signal interference & distortion. The telephone network path between modems must be sufficiently free of noise and frequency distortion to permit the desired speed. The modem analyzes these line impairments as they affect the quality of the transmission signal. Poor signal quality causes transmission errors, reduced throughput, reduced connection speed, and even dropped connections.

What you can do
a. Experiment with eliminating potential sources of line impairments in the home:

- Any device connected to any telephone outlet, especially if used by the modem, and even if on a different line: telephones, including cordless telephones and their base stations, answering machines, fax machines, caller ID boxes, and other modems
- Telephone line splitters, cable extenders, faulty or overly long telephone cables (shorter is better)
- Surge protectors, including those that offer telephone line protection
- Alarm systems, especially those that are connected to the telephone system
- Computer equipment, including speakers
- Fluorescent light fixtures and light dimmers
- Satellite dish receivers
- Appliances such as air conditioners, refrigerators, dryers, microwave ovens, and televisions
- Any AC power source and related cabling
- All other things electrical, including issues with the premises wiring: loose or corroded connections, too many splices or bridges, insulation deterioration and exposed wiring, non-twisted pair telephone wiring

Start with a direct, unobstructed, modem-to-outlet connection using a short, high-quality telephone cable. As a way of confirming the issue prior to isolating it any further, there is the option of testing with a direct connection to the external telephone box located at the back or side walls of the residence. It provides one or more standard telephone jacks supplying the home telephone connections but bypassing most impairments inside.

b. Listen for noise. Because the telephone company is only obligated to provide voice-quality phone lines, it is unlikely to address the many and varied off-premises sources of line impairments that can affect connection speed but don't cause audible noise. Connect a telephone to the wall jack used by the modem, then pick up the line, dial the number 1 to stop the dial tone, and listen. Contact the telephone company if the line is not quiet (loud hiss, pops, static, voices), but first disconnect other telephone devices and check again.

c. Use a local dial-in number to your Internet Service Provider. Long distance and 800 numbers aren't typically a concern, but may cause the call to be routed through more facilities, indirect paths, and different carriers with different types of equipment and lines. Local calls may be auto-

forwarded in the same manner, but most reputable ISP's don't engage in this practice. Finally, note that if you are dialing 9 to get an outside line, you are probably using a phone system that will limit throughput to around 33.6K or less.

Interoperability issues between modems

1. The modems on both the client and server side must support the same protocol. Apple 56K modems support K56flex and V.90, but not X2. Apple/GV 56K modems that have been flash-ROM updated support either K56flex or V.90, depending upon the modem updater used.

What you can do
Confirm with your ISP that you are dialing in to a number answered by a modem of the same 56K protocol as yours.

2. Where modems of different makes, models, firmware/flash-ROM revisions, and chipsets are concerned, one modem may have an incompatible method of implementing a connection that it has negotiated with the other modem, or the negotiation itself may fail. For example, if a modem cannot sustain the current connection speed but is unable to successfully negotiate a slower connection with the other modem, the connection will incur excessive transmission errors, decreasing throughput and potentially forcing a disconnect.

What you can do
a. If your modem can be flash-ROM upgraded via software, apply the most recent modem update available. Apple 56K modem updates are available online. The latest firmware code may make the two modems more compatible--or less.

b. Force a slower connection from the very start, such as by disabling 56K protocols in favor of V.34. This change is incorporated into the "V.34 Only" modem scripts available for some Apple 56K modems. A variety of other modem manufacturers supply similar ARA modem scripts for their modems. If you are connecting to the internet using software that does not use modem scripts, supply the software with a custom initialization string for your modem. Your ISP may be able to assist you, or you can teach yourself the proper initialization string by studying the AT command guide provided with your modem or available online from the manufacturer.

c. Ask your existing Internet Service Provider whether different modems are available via an alternate dial-in number, or switch to an ISP that provides different modems (call them first, as they may already know of issues they are having supporting the modem you are using). If all else fails, you may wish to go so far as to try a different modem yourself--one that your ISP recommends for best compatibility.

The settings of either modem

The default configuration of either modem may be altered to enforce one type of modulation over another (Apple's V.34 modem scripts enforce V.34, for example); disable or change the type of compression, error correction, and flow control; change the maximum and minimum speeds allowed, and respond differently when, for example, error correction fails. These settings are changed from their defaults--the factory settings--by the modem initialization string. Depending upon the connectivity software used, the modem initialization string is either entered manually into the software or is part of an Apple Remote Access modem script.

What you can do
a. Be certain that you are using the correct modem script for your modem. Macintosh computers that ship with internal modems already include the necessary modem script, and many manufacturers also provide them online separately or with modem firmware updates.

b. Try an alternate modem script if the software or the modem manufacturer provides one. A different modem script may contain an initialization string more suitable to your operating conditions. Externally contributed modem scripts may also be found in the Communications directory of Info-Mac FTP servers and elsewhere on the Internet.

c. Edit the initialization string contained in your modem script or use software that provides the option of entering an initialization string directly, such as FreePPP or MacPPP. Your Internet Service Provider may be able to tell you what initialization string, if any, they recommend for best compatibility with their modems. They may require that you fax them the AT and S-register command set from the modem's documentation, as these can vary among modems. Don't expect too much: the modem's default settings and those defined in the modem script typically place the modem into its most robust and flexible configuration, so changes often amount to turning off features that are beneficial in most circumstances. That is why Apple does not provide end-user instruction in modifying ARA modem scripts, other than to make an unsupported tool, the Modem Script Generator, available online.

A failed modem

Again, a modem is unlikely to malfunction only to the extent that it is unable to achieve its top speeds, but it's a possibility that cannot be discounted outright. To find out, use your modem in place of another **identical** modem that is able to attain higher speeds. Conversely, use an **identical** modem that is able to attain higher speeds in place of your own modem.

If you don't see similar results using the formula provided above, and both modems are using the same modem cable and power supply (if present), and both have been updated to the same firmware revision, there may be a hardware issue with the slower modem.

FREQUENTLY ASKED QUESTIONS:

Q. I found a new ARA modem script on the Internet that claims to make my modem faster, and sure enough, I'm now connecting at 48000 bps every time.

A. Be wary of modem scripts that always report the same initial connection speed or that claim to exploit supposedly hidden features in the modem. When evaluating a new modem script or modem initialization string, base your judgement upon the modem's stability and apply the formula for obtaining the average DTR. A modem script can force a high initial connection speed (or lie about it), but cannot force the modem to sustain that speed without dropping the connection. It is of little benefit to have a fast but unreliable connection, or one that always starts fast before slowing down dramatically.

Q. My Internet Service Provider advised me to disable error correction and compression in order to boost my connection speed. Is this advisable?

A. Rarely. That advice is grounded in the notion that, over heavily impaired lines, the overall throughput of the modem may decrease when the error-correction protocol is forced to retransmit data to correct the errors. But without error correction and compression, the integrity of the data being transferred cannot be maintained. The Remote Access control panel provides an "allow error correction and compression in modem" checkbox that may be disabled if you wish to experiment.

Q. Would it help to connect with something else besides Remote Access or Open Transport/PPP?

A. Probably not, but feel free to experiment. Examples of other connectivity software are FreePPP, MacPPP, LinkUPPP!, and SonicPPP. The first two do provide a more convenient method of changing the modem initialization string than software that uses Apple Remote Access modem scripts.

Q: I'm making a connection between my home and office 56K modems using Apple Remote Access Personal Server, but I cannot exceed 33.6 Kbps, despite achieving faster rates when connecting to my ISP. Is this normal?

A. Yes. In order to provide the fully digital server-side connection required to exceed 33.6 Kbps (see part 1 of "Impairments in the telephone network path"), an Internet Service Provider uses high speed digital servers and modem racks quite unlike the consumer modem setup. The home-to-office scenario described not only introduces an additional analog segment to the network path, but cannot avoid the 33.6K upload (transmit) limit now affecting both sides of the connection instead of just the client side. Note that the connectivity software (ARA, Timbuktu, a terminal application) is not relevant to these limitations.

Q. Is it possible to determine the highest connection speed attained during a connection, instead of just the average DTR?

A. After terminating the connection, issue an AT&F and AT&V1 command from a terminal program. This works for most modems. The results will look something like this:

```
AT&F
OK

AT&V1
TERMINATION REASON.......... LOCAL REQUEST
LAST TX rate................ 21600 BPS
HIGHEST TX rate............. 21600 BPS
LAST RX rate................ 24000 BPS
HIGHEST RX rate............. 24000 BPS
PROTOCOL.................... LAPM
COMPRESSION................. V42Bis
Line QUALITY................ 035
Rx LEVEL.................... 023
Highest Rx State............ 67
Highest TX State............ 67
EQM Sum..................... 00C3
Min Distance................ N/A
RBS Pattern................. FF
Rate Drop................... FF
Digital Loss................ None
Local Rtrn Count............ 00
Remote Rtrn Count........... 00
Flex fail
```

HIGHEST RX rate (or MAX RX and similar) represents the highest connection speed attained. Note also the line QUALITY entry: values greater than approximately 020 suggest a line quality that is unlikely to permit connections greater than 33.6K, but results may vary.

AppleShare IP: Support For Mac OS Extended Volumes

This article discusses using Extended volumes with AppleShare IP.
This article has been archived and is no longer updated by Apple.
AppleShare IP 5.0.3 provides support for Mac OS 8.1 and volumes formatted with Mac OS Extended format, also referred to as HFS Plus. Earlier versions of AppleShare IP are not supported with Mac OS 8.1, and therefore do not support Mac OS Extended formatted volumes.

For customers using earlier versions of AppleShare IP, updaters are available on Apple Software Updates.

If you own Mac OS 8.0, you can find the updater to Mac OS 8.1 on Apple Software Updates.

This article can help you locate the software update mentioned here:

DVD-Video: Overview

This article provides information and a general overview of Digital Versatile Disc (DVD) Video technology, particularly as it relates to Apple. Included in the article are the following sections:

- Acronyms Explained
- DVD-Video Compared
- DVD-Video Quality
- Video
- Audio Options
- Interactive Video
- Subtitles

This article deals only with DVD-Video. For an overview of DVD technology, see the following Tech Info Library article:

Article 24451: "**DVD Technology: Overview**"
This article has been archived and is no longer updated by Apple.

Acronyms Explained

There are 4 main areas that digital video can be divided into:

- physical, shiny disc distribution (similar to distribution on VHS video tape)
- collection of original footage (similar to Hi8/VHS/S-VHS camcorders)
- over-the-air broadcast television
- cable/satellite broadcast television

DVD-Video is the physical, disc based distribution channel. All of the DVD-xxx variations are based on the same shiny disc. However, the format used by the differing versions can create compatibility issues.

DV (and its variations) is the most common collection of original digital footage.

DTV is used fairly often to describe the overall digital over-the-air broadcast method. With specific formats noted as:

- **HDTV** - High Definition TV, a 16 x 9 ratio image at greater than a 1000 lines of horizontal resolution. There are two resolutions defined by the United States Federal Communications Commission (FCC). Both can be presented in progressive (typical of computer monitors) or interlaced (typical of NTSC televisions).
- **SDTV** - Standard Definition TV, a 4 x 3 ratio image at approximately 720 lines of horizontal resolution. Also available in interlaced and progressive. Takes only a small part of the HDTV bandwidth allowing as much as four separate programs to be sent down the same HDTV channel.

DSS is the generic term for the small dish satellite systems used to deliver multitudes of channels to the home. Cable TV operators deliver a similar digital signal via cable to their subscribers.

The one thing to remember about all of these different digital video formats is that hardly any of them are directly compatible with any other format. To get from one format to another will require some form of transcoding.

DVD-Video Compared

Let's look at DVD-Video and how it relates to the other formats.

DVD-Video uses a MPEG-2 based compression technique for the video image. MPEG-2 is also used with DSS, digital cable, HDTV and SDTV.

However, DVD-Video employs a variable bit-rate compression scheme. Variable bit-rate compression allows the compressionist (the person making the decisions about how much compression to use) to apply a higher compression ratio to a low detail, low action scene; while allowing a high detail, high action scene to be compressed at a lower ratio. You want to do this because the higher detail/action scene would show artifacts more as the compression ratio is increased. A lower detail/action scene doesn't change as often and thus can be compressed at a higher ratio without artifacts appearing. A disadvantage of variable bit-rate compression is that it is not a real time operation. At a minimum, two passes are required to achieve any advantage.

Another element of the MPEG-2 stream used with DVD-Video is the additional information encoded in the video stream. Navigation information, language information, subtitle information, parental control information, Dolby Digital audio, and so forth are all contained in the DVD-Video

MPEG-2 video stream.

DSS and digital cable use a constant bit-rate compression. Since these distribution channels are dealing with real time events, there is no time for the two pass method used in variable bit-rate compression. Therefore, the image is always compressed the same amount whether it is a low detail/action scene or a high detail/action scene.

DSS and digital cable do not provide navigation, subtitle, parental control and alternate language abilities found in DVD-Video. These delivery channels would not be able to understand these data elements.

The MPEG-2 stream coming from over-the-air broadcast channels contains a different structure than either of the other MPEG-2 based data streams. Resolution is one of the first things that differs from the other two.

DV tapes do not use an actual MPEG-2 compression. While the basic theory used for compression is the same for DV and MPEG-2, the DV compression is not MPEG-2.

DVD-Video Quality

DVD-Video uses MPEG2 compression. Any time an image is compressed there is the opportunity for image degradation. A good compressionist can create such a good image that 90% of the viewers will not be able to see any compression artifacts in the movie. However, a less than average compressionist can totally ruin a movie by not paying attention to detail.

There is also the issue of viewing a movie on a computer screen versus a television screen. A computer screen is capable of providing a much higher quality image than does a NTSC television screen. There are titles which may be perfectly acceptable on an NTSC television that will look very poor on a computer screen. This difference will most likely be traced back to a less than ideal job of compressing the original material--but the viewer may likely believe it to be the fault of the computer.

Video

General Video Information

There is DVD-ROM. There is MPEG-2. There is DVD-Video.

- DVD-ROM is the big picture.
- DVD-Video is one way to use DVD-ROM.
- DVD-Video is one way to use MPEG-2

Thus, DVD-Video is a specific use of MPEG-2 video on DVD-ROM in a specific manner.

A DVD-Video disc contains a stream (a track) of MPEG-2 (Main Profile@Main Level, also known as MP@ML) video compressed and encoded in either a Constant Bit Rate (CBR) or in a Variable Bit Rate (VBR). The DVD-Video specification also allows the lower resolution MPEG-1 CBR and VBR video.

An interesting aspect of DVD-Video is the ability to have the 24 frames per second (fps) film encoded at 24 frames a second. With other forms of home video, the 24 fps film standard has to be converted to the NTSC spec of 29.97 fps via a process called 3:2 pulldown. (NTSC consists of 30 frames with 2 fields each.) What 3:2 pulldown does is double one field creating 3 fields for one of 24 film frames - and does this often enough to turn the 24 film frames into 30 video frames (well, actually 29.97 video frames - but that's another math story.) In order to display these 24 frames on an average television, the DVD-Video playback device does an 'on-the-fly' 3:2 pulldown.

So, why have 24 frames encoded and do on the fly conversion? With current computer displays and with future digital TVs it will be possible to display the actual 24 fps in which the film was shot. As a result, a more correct feel will be imparted to the playback of movies shot on film and transferred to video.

Video Image Information

The number of pixels in a DVD-Video frame are typically 720 x 480 of NTSC source material. The traditional method of measuring of NTSC devices has been "lines of horizontal resolution". Using this method:

- VHS source material is rated at approximately 230 lines for standard 4:3 screens (approximately 172 for 16:9 screens)
- laserdisc is approximately 425 for 4:3 (approximately 318 for 16:9)
- DVD-Video is approximately 540 for 4:3 (approximately 405 for 16:9).

In practical terms, DVD-Video will most likely be rated at approximately 500 lines of horizontal resolution.

A 720 x 480 pixel count should not be confused with a "lines of horizontal resolution" measurement. The numbers may be different. Here's why:

"lines of horizontal resolution" (LoHR) comes from the ability of a device to resolve an industry-standard reference image. Part of the image has groups of lines printed at various distances from one another. LoHR is determined at the point where these printed lines are resolvable into individual lines. So while it is possible to have 720 horizontal pixels, if you cannot visually distinguish each line, you don't have 720 LoHR.

MPEG uses temporal compression. Temporal compression uses a key frame to record everything in the frame. This complete frame is an I-frame. During temporal compression, subsequent frames consist of only the differences from the I-frame. So a still image can be an I-frame. The still frame can be displayed for a specified amount of time; or it can be displayed indefinitely--generally with a "continue" button on the screen. Still frames can play sound. Menus are generally still frames.

Subpictures are not still frames. Subpictures are much more restrictive. Subpictures do not have the color range or detail of MPEG-2 video. They are used as overlays on the MPEG-2 video stream for subtitles, closed-captioning; karaoke, menus, and very simple animation. A portion of the DVD-Video interactive command set allows a title developer to perform effects such as scroll, move, color, highlight and fade subpictures. There are 32 subpicture streams available within the DVD-Video spec. Subpictures can contain 4 colors from a palette of 16 colors and four contrast values out of 16 levels from transparent to opaque.

Audio Options

A DVD-Video disc can have up to 8 audio tracks (tracks are sometimes referenced as streams). Each of these tracks can be one of three formats:

- Linear PCM -- from 1 to 8 channels
- Dolby Digital (also known as AC-3) -- from 1 to 5.1 channels
- MPEG-2 audio -- from 1 to 5.1 or 7.1 channels

Note: tracks (or streams) are composed of channels

Additionally, the Digital Theater Sound (DTS) format is an optional format. DTS is another 5.1 channel format which was developed to improve the audio experience in movie theaters. There is reserved within the DVD standard an audio stream format for DTS. DTS format DVD-Video discs first appeared in late spring of 1998.

Linear PCM
Linear PCM is generally the default audio track. It will be sampled at a rate of 48kHz or 96kHz. Audio CDs are sampled at 44.1kHz. A sample size of 16, 20 or 24 bits is allowed. Audio CDs use a sample size of 16 bits.

According to the DVD-Video specification it may contain up to 8 channels. There is a maximum bit rate of 6.144 Mbps. Linear PCM is uncompressed audio which means the choice for the number of channels may limit the sample rate or sample size used. Typically up to 5 channels should be able to use the highest data rates and sizes.

While DVD-Video playback devices are required to support any of the above variations, the device could subsample from 96kHz down to 48kHz while not using the full 20 or 24 bits. Still the lowest output from the PCM track would be 48kHz @ 16 bits--better than Audio CDs using 44.1kHz @ 16bits.

Dolby Digital
If PCM is not the default audio track, then the default will most likely be Dolby Digital. The Dolby Digital format is compressed data using the AC-3 technique. The source material is normally taken from PCM recordings at 48kHz at up to 24 bits.

Typically you will find Dolby Digital to be a 5.1 channel format. The "5" breaks down to left, center, right, surround left and surround right. The ".1" channel is the low frequency effects (LFE) channel--the channel that would be directed to a subwoofer. However, there are a number of valid channel formats in DVD-Video Dolby Digital:

- single mono
- dual mono channels
- standard stereo
- left/center/right
- stereo w/single surround
- left/center/right/single surround
- stereo w/dual surrounds
- left/center/right/dual surrounds

With each of the above the ".1" (LFE) channel is optional. Again, the most common channel format you will find for Dolby Digital is the 5.1 arrangement (the last one in the list plus the LFE). You will also find that most regional 1 DVD-Video discs contain a Dolby Digital track. Although as of the late spring 1998 a number of DTS DVD-Video discs are starting to appear.

MPEG-2 Audio
The definition of MPEG-2 audio allows it to be a multi-channel format, although some playback devices provide only basic stereo left/right

delivery. Somewhat like Dolby Digital there are a number of channel configurations available with MPEG-2 audio, including:

- single mono
- stereo
- stereo w/single surround
- stereo w/dual surround
- left/center/right
- left/center/right/single surround
- left/center/right/dual surround
- left/left-center/center/right-center/right/dual surrounds

As with Dolby Digital, the LFE channel is optional on all of the above channel configurations. When the LFE is added to the last item in the above list, it is often labeled as "7.1".

Both MPEG-2 and MPEG-1 formats are supported, although MPEG-1 Level III (also known as MP3) is not supported.

DTS (Digital Theater Sound)
DTS is an optional DVD-Video multi-channel audio format (typically 5.1). The DTS format can provide a data rate nearly 4 times as much as Dolby Digital - meaning less possibility for audio artifacts from compression. It also means that other options in the overall data stream may have to be dropped (like less language tracks or no alternate angle tracks, and so forth).

DTS has several possible channel configurations, including:

- single mono
- stereo
- left/center/right
- stereo w/single surround
- stereo w/dual surrounds
- left/center/right/dual surrounds

All have the option to include the LFE channel.

Nearly all playback devices prior to the spring of 1998 do not support DTS. After that time only specific playback devices support DTS. The devices which do support DTS are normally marked with an official "DTS Digital Out" logo.

SDDS (Sony Dynamic Digital Sound)
Another option for multi-channel audio is SDDS in 5.1 or 7.1 configurations. However, Sony has not announced any plans to provide support for SDDS in the DVD-Video arena.

General Audio Info
The DVD-Video specification calls for all NTSC discs to contain either PCM audio or Dolby Digital audio on at least one track. Additional audio tracks may be any of the other formats.

DVD-Video playback devices are expected to have a resident Dolby Digital 2-channel decoder (chip, software, etc.) which mixes a 5.1 Dolby Digital down to Dolby Surround stereo so that a standard stereo playback can be achieved.

All of the standard or optional audio formats provide support for karaoke mode. This consists of 2 channel stereo (L/R) with an optional melody channel and two optional vocal channels.

Interactive Video

DVD-Video allows a limited amount of interaction with the disc contents. This interaction is far less than people would be accustomed to with CD-ROM on computers, but it is more than people would expect from a video tape or laser disc.

The primary method of interaction is through the use of menus. Most DVD-Video discs provide a menu for selecting a variety of elements from the disc, such as playing the movie, playing the background video, hidden easter eggs, and even simple games. Some discs provide alternate story lines which can be selected via the menu system.

The menus consist of a backdrop image with up to 36 buttons which are selected by using a remote control with left-right-up-down arrows (or a mouse/trackpad on a Macintosh with DVD-Video). Once a button is selected, a select button on the remote control will activate the selected activity.

Supporting the menus is a very basic command instruction set (not available to the person playing the movie, but available to the disc developer). There are 24 system registers which contain information such as language code, audio and subpicture settings, parental level, and so forth. There

are also 16 general purpose registers for command instructions.

Using the commands provide a method to branch to other commands. Commands are used to control the player's settings, move to different sections of the disc and control such elements as the selection of which audio streams, video streams, camera angles, subpicture, and so forth.

The content of a DVD-Video disc is organized by 'title' (movie) and 'sections of titles' (chapters). The chapters can be organized through the use of a program chain or 'PGC'. For example, a PGC can be created which will be able to play back only the chapters that would cause an 'R' rated movie to become a 'G' rated movie if the parental control level was set in such a way. Or the PGC could create an alternate story line. PGCs can be used to construct other sequences of chapters as well.

Following a PGC is seamless. There are no breaks in the flow of the movie - like there is when two sided laser discs are flipped. Different PGCs are different paths through the same material.

Subtitles

Subtitles are not generated by the Macintosh computer--they are placed on the disc by the DVD pressing operation. The subtitles are therefore a part of the MPEG2 data stream that can either be "turned on" or "turned off". If they are "turned on" they are composited over the top of the video image. If "off" they are ignored by the process and simply are not displayed. On most DVD-video discs there will be more than one language available for subtitles. Each of these different language subtitles are a part of the MPEG2 data stream. If a specific language is selected to be displayed, that part of the data stream is composited over the video image.

This means that the Mac OS does not have access to the subtitles such that different fonts can be used. The font is selected and recorded in a subpicture stream prior to the pressing of the DVD-video disc.

Mac OS 8.1: Controlling Volume On NuBus-Based Power Macintosh

After installing Mac OS 8.1 on a NuBus-based Power Macintosh (including 6100-, 7100-, and 8100-based machines), the volume control in the Monitors & Sound control panel will not control the volume of speakers or headphones connected to the sound out jack.
This article has been archived and is no longer updated by Apple.

Symptom

After installing Mac OS 8.1 on a NuBus-based Power Macintosh (including 6100-, 7100-, and 8100-based machines), the volume control in the Monitors & Sound control panel will not control the volume of speakers or headphones connected to the sound out jack.

Solution

Update to Mac OS 8.5.

Note: The volume control will work fine for the internal speaker on the computer, but will not adjust the volume of any device connected to the sound out/headphone jack on the back of the computer. If you are using external speakers, the volume control on the speakers can be used to control the volume. Also, some applications have a separate volume control that can be used to adjust the volume.

Apple Tech Notes: What They Are, Where To Find Them

This article describes Apple's Tech Notes and tells where to find them on the Internet.

Note: Tech Notes are intended for developers. If you are not a developer, they may be too technically detailed for your purposes. Nonetheless, many people have derived some benefit from reading various Tech Notes.
This article has been archived and is no longer updated by Apple.
Tech Notes provide you with the latest technical documentation on Apple technologies and system updates, fixes and errata to Inside Macintosh (a reference for the Mac OS operating system), as well as programming tips and techniques to advance your development efforts. New Tech Notes are published monthly and are reviewed by Apple engineers for technical accuracy and robustness.

Apple Tech Notes can be found at this address on the World Wide Web:

http://developer.apple.com/technotes/

For additional developer-related information, visit the Apple Developer site at this address on the World Wide Web:

http://www.apple.com/developer/

Apple Studio Display 15" LCD: "No Computer Signal" Message

This article explains and provides a solution for why the message "No Computer Signal" may appear in sleep mode.
This article has been archived and is no longer updated by Apple.

Symptom:

I have an Apple Studio Display 15" LCD and when my computer goes into sleep mode the Apple Studio Display does not go into sleep mode. Instead a message saying "No Computer Signal" is displayed.

Solution:

The Apple Studio Display should go into sleep mode when you select sleep or when Energy Saver is set to put the system or display to sleep. If you see the message "No Computer Signal" remain on the screen, then the Apple Studio Display needs to be reset to clear a value from its internal memory. To do this, press the reset button on the front of the Apple Studio Display (far left button with the triangle icon) until the LED starts to flash.

Apple Studio Display 15 LCD: No Video When 1024 x 768 At 72Hz Selected

This article explains and provides a workaround for a situation in which no video is available on a Apple Studio Display 15" LCD when set at 1024x768 at 72Hz.
This article has been archived and is no longer updated by Apple.
Symptom:

I have an Apple Studio Display 15" LCD connected to a Power Macintosh 8500. When I select the resolution 1024 x 768 @ 72Hz my display loses video and the message "Signal out of Range" is displayed. I have tried restarting the computer and selected the reset button on the front of the display but the situation remains. How can I restore the video?

Solution:

Although the 1024 x 768 @ 72Hz resolution setting is available before you install the Apple Display Software 1.6 on a Power Macintosh 7500, 8500, 7600 and 8600 CPU, this setting does not work with the Apple Studio Display. If selected, the display will lose video and the following steps must be performed in order to restore video:

1. Press the power on key on the keyboard (arrow pointing left on the upper right hand corner of the keyboard). You should hear an alert sound.
2. Press the R key to restart the computer.
3. At the startup tone, hold down the Command, Option, P, and R keys on the keyboard to reset PRAM. Continue to hold down these keys until video is restored.

The software included on the CD with the Apple Studio Display, Display Software 1.6, needs to be installed after you restore video in this way. This software will not list the 1024 x 768 @ 72Hz resolution as available for use on the Apple Studio Display.

Apple FireWire Card: Read Me

This article contains the Read Me document for the Apple FireWire DV card.
This article has been archived and is no longer updated by Apple.

Introduction

The Apple FireWire DV product lets you use digital video (DV) equipment, such as camcorders and tape decks, with your computer. Using a FireWire (IEEE 1394) connection, you can transfer digital video between your computer and your DV equipment. You can also control your DV equipment from the computer. Apple FireWire DV supports full-quality DV (full frame size and full frame rate), and video equipment that supports either the NTSC or PAL video standards.

Apple FireWire DV works with QuickTime and takes advantage of new features in QuickTime 3.0. Most applications that support QuickTime will work with this product.

This document describes how to use the Apple FireWire DV product to capture a movie, export a movie and control DV devices.

Setup and Installation

Setup
You will need the following in order to capture a DV movie:

- The Apple FireWire Card
- The Apple FireWire Card Software Installation CD
- A camera or tape deck that supports DV and IEEE 1394
- A FireWire cable
- A QuickTime-based application with capture/export capability

The FireWire Card is a standard PCI card with three FireWire ports. You can attach your DV equipment to any of the three ports.

The Installation CD includes the system software pieces that enable FireWire DV capture, FireWire DV export, and device control. The following four items are added to the extensions folder:

- DV Support
- DV Enabler
- FireWire Support
- FireWire Enabler

The following two items are added to the Adobe Premiere(TM) Plug-Ins folder:

- DV Device Control
- DV Export

Additionally, a folder titled FireWire is created. This contains the FireWire Card Tester application and the plug-ins for Adobe Premiere.

Connect your DV equipment to the FireWire card using the FireWire cable. The small connector attaches to the DV equipment and the large connector attaches to the computer. The connection point on your DV equipment may be marked "DV IN/OUT" or "IEEE 1394." The small connector must be oriented carefully when it is connected. If it doesn't seem to fit, examine it carefully, and try again without using too much force.

Several QuickTime-based applications with capture/export capability are available. These include Adobe Premiere(TM), Strata VideoShop(TM), and others. A QuickTime application that supports capture may not support export.

Installation
If you ordered the Apple FireWire card as an option with a new Macintosh computer, the card should already be installed.

The Apple FireWire DV software requires QuickTime 3.0, which is included. But, some QuickTime-based applications may replace QuickTime 3.0 with an older version when they are installed. If you are installing such an application, install it first, and then install the Apple FireWire DV software, to ensure that QuickTime 3.0 is correctly installed.

To install the Apple FireWire DV software, follow these steps:

1. Insert the Apple FireWire Card Software Installation CD.
2. Open the Apple FireWire DV Installer.

3. Click the Install button.

The Apple FireWire DV software will be installed. QuickTime 3.0 will also be installed if you do not already have it.

Capturing a Movie

Once you have installed the software and connected a DV device to the card, you can capture a DV movie. Turn on your DV equipment. Then open the FireWire Card Tester application provided on the CD. If there are any problems with the card or the FireWire connection, a warning will be displayed.

To use a capture application to capture a DV movie:

1. Open a capture window.
2. Select the DV device as the video input.
3. Make sure that DV is the selected compression format.
4. Select DV audio as the audio input.
5. Select 32 kHz as the audio sample rate.
6. Record a DV movie.

Each of these steps is described in detail below. Some applications may not support all the features described here.

Open a Capture Window
In Premiere, select Movie Capture from the Capture submenu, under the File menu. This will open the video preview window.

Selecting the Video Input
Many QuickTime applications allow you to change video and compression settings with the Video Input panel. Select Video Input from the Movie Capture menu to use this panel. The Movie Capture menu is on the menu bar only when the video preview window is active.

The left side of the Video Input panel can be used to change several groups of settings. Use the main menu to select the Source settings. Then change the settings (if needed), so that they match those shown below. If your DV equipment uses the PAL video standard, select PAL instead of NTSC. By making these settings, you have selected your DV equipment to be the input source.

Figure 1 Video Input Panel

Selecting the Proper Compressor
It is important to select a compressor that is matched to your DV equipment, in order to obtain maximum video quality. Change the main menu from Source to Compression, and then change the settings to those shown below. If you selected PAL in the previous settings, select DV-PAL in these settings. You can also select other compressors, but these may cause a reduction in the quality of the video that you capture. Click OK when the settings are correct.

Figure 2 Video Compression Panel

Selecting the Sound Input
QuickTime allows you to record audio and video at the same time. You can choose to record the audio that comes from your DV equipment, or audio from another source. To select the audio source, select Sound Input from the Movie Capture menu. The Sound Input panel will appear. The left side of the Sound Input panel can be used to change several groups of settings. Use the main menu to select the Source settings. Then change the settings (if necessary) so that they match those shown below.

Figure 3 Sound Input Panel

Selecting the Audio Sample Rate
It is important to select a sample rate that is matched to your DV source, in order to obtain maximum audio quality. Change the main menu from

Source to Sample, and then change the settings to those shown below. Click OK when the settings are correct.

Figure 4 Sound Input Panel

Capturing Video and Audio

Video and audio can be captured from a DV source in the same way as with an analog device. You should still have the capture window open. If not, select Movie Capture from the Capture submenu under the File menu.

Figure 5 Movie Capture Window

Make sure there is a tape in your DV equipment. Press the Play button or put your DV equipment in the same mode. Wait for video to appear in the Movie Capture window. Press the Record button in the Movie Capture window. Wait for a few seconds, and then press the mouse button to stop the recording. During recording, images may not appear at full frame rate.

Your DV movie is complete, and you can save it to disk or work with it immediately.

DV Movie Export to a DV Device

You can record QuickTime movies onto DV tape using the export function in Premiere. To use this function, select DV Export from the Export submenu, under the File menu.

The export quality will be best if you export a QuickTime movie that is already in DV format, such as the movie you recorded using the steps described above.

If you export a movie that has multiple audio tracks, they will be combined into a single (stereo) DV audio track.

You can either record the data being exported, or you can preview it. If you want to record the data, put the device in record mode before activating the export function. If recording is not selected, then previewing will happen automatically.

A dialog box will be displayed during the export operation. A progress bar will indicate the time remaining and a message will be displayed if a data conversion is taking place for some reason. Optimal export quality is obtained when no conversion is taking place. If the DV movie to be exported is not full size (720 x 480 NTSC, 720 x 576 PAL), the exporter will try to convert the movie.

Device Control

You can control DV equipment, connected using FireWire, from your computer. To use this feature, you must select the correct device control method. Select Device Control from the File menu. Then select DV Device Control from the menu in the Device Control window as shown below, and click OK.

Figure 6 Device Control Window

After you select DV device control, the Movie Capture window will look different. You can perform basic videotape operations like play, stop, pause, jog, and shuttle using the controls in this window.

Figure 7 Movie Capture with Device Control

Frequently Asked Questions

Q: Can I use other QuickTime editing applications to capture and edit DV movies?

A: Yes. Apple's DV hardware and software extensions allow most applications that work with QuickTime to capture, edit, and play back DV movies.

Q: When exporting movies to a DV camera or VCR, the frame rate is slow.

A: Several things can cause degradation of movie export to DV devices. Make sure that you have rendered the movie in DV format, with a size of 720x480 for NTSC or 720x576 for PAL. Make sure that the chosen compressor matches the video standard used by your equipment (DV NTSC or DV PAL).

Q: When I watch the movie being exported, it looks blocky.

A: Blocky movies usually indicate that the video has been scaled. Make sure that the size of the movie is 720x480 for NTSC or 720x576 for PAL.

Q: How do I capture movies from my DV camera or VCR without losing quality?

A: The key to making a perfect capture is the proper settings in your capture application. In Premiere, choose settings of 720x480 for NTSC or 720x576 for PAL within the Record Settings dialog. You also need to click the Record at: button.

Q: Can I connect more than one DV device to the computer?

A: Yes, but only one device can be used at a time. For best results, turn on only one DV device at a time.

Q: When I watch movies, the frame rate seems slow.

A: Frame rate is directly related to two things: the rate chosen at the time you grab, and the ability of the computer to decode the movie. If your movie is playing slowly, make sure that you chose the correct frame rate in the Compression panel under Video Input when you recorded the movie.

When grabbing large images, the computer may not decode the images at full frame rate. Try resizing the movie playback window to make it smaller.

Q: When capturing a movie, the image looks blocky.

A: When grabbing movies, some applications will display DV movies at a lower quality, in order to increase the decompression speed. These movies are actually stored at their full quality. To play back these movies at the highest possible quality, use MoviePlayer or another application that fully supports QuickTime 3.0.

Q: Can I control my DV device from the computer?

A: Yes. All DV devices support a minimal set of commands over FireWire. The standard commands include stop, pause, rewind, fast forward, and play. Many devices support additional commands.

To control a device from your computer, you must use an application such as Adobe Premier that supports device control. See the instructions above for selecting device control.

Q: Do I need any additional cables to control DV devices from the computer?

A: No. DV devices use the FireWire cable to transmit and receive device control commands.

Q: After capturing a movie, I do not hear audio when playing it.

A: You might not have selected DV Audio in the audio selection dialog.

Q: The captured audio sounds distorted.

A: Most DV devices support either 32 kHz or 48 kHz audio. Set the audio sample rate to match that being used by your DV equipment, as described above in the section titled "Selecting the Audio Sample Rate."

Q: My DV camera has gone into sleep mode and when it wakes, I no longer see video in the capture window.

A: Some DV devices behave unusually when they sleep. Try closing the Movie Capture window and reopening it. If the video does not reappear, close the movie capture window, unplug the FireWire cable from the DV device, then wait a moment before reattaching the FireWire cable to the device. Then open the Movie Capture window again.

Q: When I try to capture a movie greater than 9 minutes long, Premiere stops recording.

A: The Macintosh file system has a maximum file size of 2 gigabytes. About 9 minutes of video and audio can fit into a 2 gigabyte Macintosh file.

Q: Why does the video look blocky when I use filters, transitions, or titles?

A: Some applications do not decompress DV frames in the highest possible quality when applying a filter, using a transition, or adding titles. Currently, there are only two ways to apply effects without a significant loss of video quality.

One way is to transcode the frames to another video format, such as Component Video. Apply the effects and then transcode the result back into DV format.

Another way is to use another application such as Adobe After Effects to apply effects to the necessary frames.

Q: When grabbing movies, I don't get all the frames.

A: Check to make sure the proper DV compressor is selected in the Video Input panel. Make sure that the best frame rate is selected (best frame rate is implied when the frame rate field is blank in the video dialog).

Q: I can't select the DV Video option from the Video Input panel.

A: Use the FireWire Card Tester application to make sure that the card and DV device are working properly. Make sure that your DV equipment is turned on.

Q: I don't hear any audio while capturing.

A: Audio playthrough during capture is not supported.

Q: What are the suggested capture settings?

A: The recommended capture settings for DV are:

- capture size 720x480 (NTSC) or 720x576 (PAL)
- audio sample rate should be the same as the source (typically 32 kHz or 48 kHz)
- compressor type should be the same as the DV device (either DV - NTSC or DV - PAL)

Q: Can I record multichannel audio such as 4 channel, 12 bit, 32 kHz?

A: Yes. You can select the audio input mode.

Some DV devices can record one stereo channel of audio at 32 kHz, 44.1 kHz, or 48 kHz. When operating in these modes, the Sound Input selector will indicate "First 2 channels."

Some DV devices can also record two stereo channels (four mono channels) of audio in 32 kHz mode. It is possible to dub audio onto the second stereo channel with some DV equipment. When operating in this mode, there are three options available: "First 2 channels," "Second 2 channels," and "Mix 4 channels." The options operate as follows:

- First 2 channels: camera audio is recorded
- Second 2 channels: dubbed audio is recorded
- Mix 4 channels: camera audio and dubbed audio are recorded

Q: If I capture from a blank spot on the tape, the movie has audio/video synchronization problems.

A: The DV specification and camera operating manuals state that blank areas in the tape may cause interruptions of the camera time code. The camera will not transmit valid frames during the blank transition, but Quicktime will still be marking time. It is recommended that you avoid recording over blank tape spots.

Q: How do I get the fastest DV movie playback on the computer screen?

A: The DV decompressor is optimized for speed when the following conditions are met:

- Low Quality decompress mode
- Quarter Screen video window size
- "Thousands of colors" screen mode

- Sound is a separate "AIFF" track and not "dvca," or sound is disabled

Q: How do I get the highest quality DV movie playback?

A: The DV decompressor is optimized for quality when the following conditions are met:

- High Quality decompress mode
- Full Screen video window size (720x480 NTSC, 720x576 PAL)
- "Millions of colors" screen mode

Q: Can I export 16 bit, 48 kHz audio?

A: No. The only supported audio format is 12-bit 32 kHz audio.

Q: What are NTSC and PAL?

A: They are video formats used in various regions of the world. Consult the manuals that came with your DV equipment.

Q: How do I determine if I should choose 32 kHz or 48 kHz audio?

A: Some DV equipment indicates 32 kHz as 12-bit and 48 kHz as 16-bit. Refer to the manuals that came with your DV equipment.

Q: My DV movie doesn't play back smoothly in MoviePlayer.

A: Try increasing the partition size of MoviePlayer. This can be set selecting "Get Info" from the Finder's File menu, while MoviePlayer is selected. DV playback requires more memory than most video compression formats.

Q: My DV equipment is putting out 4 channel audio, but I can only select "First Two Channels" from the Sound Input panel.

A: The DV software is not able to determine the format of audio until valid samples have been received. Make sure your DV equipment is transmitting and then open the Sound Input panel. You should see the level meters strobing. Three audio channel choices should now be available.

Q: Adobe Premiere does not work properly after a system crash?

A: If you hot plug or unplug the camera while the capture window is opening, Adobe Premiere may quit with a Type 1 error. In this case the Adobe Premiere Preferences file is damaged. You need to put the "Adobe Premiere 4.2 Prefs" file in the trash and restart Premiere with the default preferences. This problem can be avoided in the future by not changing the camera state while opening the capture window.

Your iMac doesn‘t respond to the keyboard or mouse

If my iMac does not respond to the keyboard or mouse, what should I do?
This article has been archived and is no longer updated by Apple.
To isolate the issue, try the following troubleshooting steps:

Confirm Connectivity

Check to see if the keyboard and mouse cables are securely connected.

Bypass Other USB Devices

If the keyboard or mouse is connected to the USB port of a device other than the iMac itself, try bypassing that device by connecting the keyboard or mouse directly to the iMac.

Try Alternate Ports

Confirm that a particular USB port isn't at fault by trying the keyboard or mouse in the alternate USB ports: both devices can be connected to either of the two USB ports under the iMac's side I/O door. The mouse can additionally be connected to either of the keyboard's two USB ports, though if the keyboard is unresponsive, don't trust either of its ports for testing the mouse--use the ports under the I/O door instead.

It is not necessary to power off or restart the computer before or after switching ports.

Rule Out Software

Make sure the issue is not caused by a software conflict or damaged software, which will usually affect both keyboard and mouse, and often intermittently. Note, however, that if the keyboard power button cannot be used to power on the iMac, the issue is not in software.

Software issues can be ruled out by attempting such basic troubleshooting steps as starting up with extensions off or starting the computer from the system CD, though note that neither of these steps may be possible if there is a hardware issue with either device or the USB port.

AppleShare IP 6.0: IMAP Admin Access Port

This article explains the purpose of the IMAP Admin Access Port of AppleShare IP 6.0 Mail Server and how to use it.
This article has been archived and is no longer updated by Apple.
The AppleShare IP (ASIP) 6.0 Mail Server's Advanced Settings lets you turn on access to the IMAP Administrator Access port (port 626). Mail administrators can remotely access the mail server at this port, view outgoing mail waiting to be delivered to other SMTP hosts, and view mail in users' mailboxes. The messages can be read, forwarded, and deleted. This is a very powerful feature that is useful in troubleshooting and mail server management; care should be taken to restrict this access to only trusted administrators.

To use the IMAP Administrator's Access Port, you'll need to do the following:

1. Turn on access to the IMAP Admin Access port in the Advanced Settings of the Mail Server Admin program.
2. On the Server, set up a user with which to access the port. The user called "Mail Administrator" (internet alias: Postmaster) could be used for this purpose, but any account that meets the following three criteria could be used: The user must: 1) have privileges to log into the file server, 2) be authorized to administer the file server, and 3) have mail enabled (IMAP).
3. To access the IMAP Admin Access port, you must use an IMAP client that supports nested folders and allows you to change the default port for IMAP connections. (Microsoft Outlook Express is an example of software that supports these features.) Set up an account for the Postmaster, entering the information for the server (as you would for any user account) but change the port to 626 (in Outlook Express, this option is under the "Advanced" button when creating the account in Preferences).
4. Log in from the IMAP client using the Postmaster account.

What Is LPR?

This article explains what LPR/LPD is, and what it does.
This article has been archived and is no longer updated by Apple.

Definition of LPR/LPD

LPR/LPD is a platform-independent printing protocol that runs over TCP/IP. Originally implemented for BSD unix, its use has spread into the desktop world and is a de facto industry standard. The specification for LPR is defined in Request for Comment (RFC) 1179.

Terminology

LPR: Line Printer Remote. Refers to the process that sends jobs to the printer or print queue. This is analogous to the print client software and is often called the 'LPR client'.

Apple has included an LPR client starting with the LaserWriter 8.5.1 printer driver, which shipped with Mac OS 8.1. It is also available separately. This software enables you to send print jobs to any LPD printer or print server.

LPD: Line Printer Daemon. Refers to the process that accepts print job from the line printer daemon client (the LPR client). This is analogous to the printer or the print server software and is often called the 'LPD server'.

The print server waits for the client to send it jobs. A print server may be capable of handling multiple printers and print queues at once. Since it (usually) has only a single IP address, the queue name must be used to specify the intended print queue.

LPR and LPD also refer to the protocol defined by the LPR/LPD specification (RFC 1179).

How LPR Works

LPR is a lot like sending a file, except you're sending a print job instead. Also, there are two parts to each print job: the data file (the data to be printed) and the control file (instructions that describe the data file and specify what to do with the data file).

When you click the 'Print' button in the print dialog, the computer spools the print job to disk and generates the PostScript data (the data file). It then sends the data file and control file to the IP address specified in the LPR desktop printer. Since there may be more than one queue at the destination IP address, the queue name is sent at the very beginning to identify the intended queue.

If the destination is a printer, the printer prints the job. If the destination is a print server, it may do some additional processing (for example, security checking) and then forward the job to the next destination in the path (usually the printer).

Advantages Of Using LPR

- Migration to single-protocol environments
- More cross-platform; platform-independent
- Accessible via the Internet

Advantages Of Using PAP (Printer Access Protocol, the Appletalk protocol for printing)

- Better status info (idle, busy, and so forth)
- Better error info (out of paper, tray out)
- Easier to set up (autodiscovery versus manual entry/selection)

Apple LaserWriter Printers With Built-in LPD

- LaserWriter 8500
- LaserWriter 12/640PS
- Color LaserWriter 12/660PS
- Color LaserWriter 12/600PS
- LaserWriter 16/600PS
- LaserWriter Pro 810

Since these printers support LPD, you can print from any LPR client (for example, LaserWriter 8.5.1) directly to the printer. In essence, the printer itself is an LPD print server.

Other LPR clients and LPD servers

LPR and LPD have been widely adopted by other communities, including:

- Many flavors of unix.
- Windows NT: LPR client included in NT Workstation and Server. LPD server only included in NT Server.
- Windows 3.1x/95/98: LPR and LPD not included but available by third parties.

For more information on LaserWriter driver 8.5.1 and LPR printing, please see the following article:

AppleShare IP: Help With Access Privileges and Security

This article contains explanations for overcoming some common difficulties encountered when setting up access privileges with AppleShare File Server software.
This article has been archived and is no longer updated by Apple.

Volumes Are Grayed Out In The Chooser

When volumes are dimmed in the Chooser, it means that the user does not have any access privileges for that volume. You must give your users a minimum of "Read Only" access to any share point if you want them to be able to log in.

"Guest" Is Dimmed In The Chooser

If the "Guest" option is dimmed in the Chooser, the server administrator may not have enabled user "Guest" to log in. Double-click on the user named "Guest" in the Users & Groups list to enable login. Also, don't forget to give "Everyone," which will include user "Guest," at least read-only access to share points and other folders along the path where information for "Guests" will be stored.

Creating Drop Boxes

Drop boxes are folders that users can drop files and folders into, but they cannot access the files in the folder. A good example of a use for a drop box would be a folder that students could drop their homework assignments in.

Drop boxes have the following access privileges and requirements:

- Read & Write privileges for the owner (the owner is the person for whom items are being dropped off).
- "Write Only" privileges for "Everyone."
- The drop box must be within another folder to which everyone has at least read-only access (so that they can get to the drop box).

A drop box cannot be a share point. No one would be able to mount the volume, with "write only" privileges.

TCP/IP: Ports And Firewalls Explained

This article defines and describes two software components associated with TCP/IP networks: ports and firewalls. The article also explains the relationship between the two.
This article has been archived and is no longer updated by Apple.

Ports

A port is a number used to uniquely identify a transaction over a network by specifying not only the host, but the service. For example, you may have a single network server running many different IP services, such as Web service (HTTP), mail service (SMTP), LPD, AFP over TCP, and file transfer (FTP). When clients attempt to connect to your server they need your IP address, but the clients also need to indicate which service they want to communicate with so that the data can be sent to the appropriate server application. The port number is what uniquely identifies that service on that host.

For example, the default port number for SMTP is 25 and the default for HTTP is 80. If a packet comes in to host "asip.company.com" port 80, then the data is transferred to the HTTP web server. If the packet is going to port 25, the data is transferred up to the SMTP mail server.

Each host can only have one application "listening" on each port. This means that you couldn't have AppleShare IP Web Service and Personal Web Sharing both operating on the same computer unless you changed the port number for one of them (Personal Web Sharing 1.5 gives you the option to change the port number).

The port numbers used are often transparent to the end user; the client software will specify the port number. However, sometimes the user can override the defaults. For example, if you changed your Personal Web Sharing control panel so that it was using port 8080, then users could specify that port number in their URL to make a connection to Personal Web Sharing instead of AppleShare IP Web Server. The URL would look like this:

http://asip.company.com:8080

Firewalls

Port numbers are often used in creating "Firewalls", which provide security on a network. For example, if you didn't want anyone outside of your intranet to be able to access your web server, you could set up a firewall that would prohibit any packet destined to port 80 (the port assigned to your web server) from passing through your routers. Or you might set up a firewall to prevent all packets except those destined to port 25 to pass; this would allow SMTP (mail) service for your intranet, but nothing else. Firewalls can also be set up in other ways, such as allowing or refusing access based on the network number of the source computer.

AppleShare IP: Setting Up Program Linking

This article explains how to set up program linking on AppleShare IP File servers.

This article has been archived and is no longer updated by Apple.
Program linking allows applications to send Apple Events to other applications, either locally (on the same computer), or to applications across a network. For example, using Program Linking, you could use Hypercard to send a "mouseup" event to another Hypercard stack on a user's computer across the network.

To enable program linking on a file server, there are three steps which help provide security for its use:

1. Enable Program Linking for the Server.
Program linking must be enabled for the whole computer. This is done in the File Sharing control panel by clicking "Start". (The button name subsequently changes to "Stop".)

2. Enable Program Linking for the User(s).
Program linking must be enabled for each user that needs to use it. This allows you to give access only to users you know have a need for it. This is done by opening the user in the Users & Groups list on the server, and checking the box that allows program linking.

3. Enable Program Linking for the Application(s).
Each application that will be linked to--such as Hypercard--must be enabled for program linking. This is done by selecting the application in the Finder, and selecting "SharingŠ" from the File menu.

Note: the Finder application itself does not need to be enabled in this way.

AppleShare: Updating Software, Hardware, Security

I want to move my AppleShare services to a newer, faster machine. How can I do this without losing my user information and access privileges?
This article has been archived and is no longer updated by Apple.
When updating both server software and moving services to another computer (updating server hardware), there are two goals:

- Bring over the Users & Groups from the old server so that you don't need to re-enter them.
- Bring over the shared data, including access privileges, so that you don't need to re-establish them.

For more information on access privileges, please see the following Tech Info Library article:

Article 30635: "**AppleShare: How Privileges Are Stored**"

Users & Groups

Here are the guidelines for moving the Users & Groups data file and the shared data to another server:

Step 1: Set up new server

1. Install Mac OS system software, if needed.
2. Configure Date & Time, AppleTalk and TCP/IP control panels
3. Set up Owner name, password, and Macintosh name in File Sharing control panel. These do not need to be the same as on the old server.
4. Install the AppleShare or AppleShare IP server software (making sure minimum system requirements are met).
5. Restart.

Step 2: Transfer Users & Groups

At the old server, copy the Users & Groups data file from the System Folder:Preferences to a floppy disk (or across the network, so that it can be accessible to the new server).

At the new server:

1. Drag the existing Users & Groups data file from the System folder:Preferences folder to the desktop.
2. Drag the copy of the Users & Groups file from the old server to System Folder:Preferences on the new server.
3. Restart the new server--don't forget this step!
4. Proceed with setting up the new server; if using AppleIShare IP, go through ASIP Easy Setup.

After setting up the services, open the Web & File admin program, and verify that users & groups have successfully been brought to the new server.

Transfer Shared Data

Use a backup utility, such as Retrospect, which will back up both the data and the access privileges. Then restore the data to the new server. Note that AppleShare must be running during both the backup and restore process, and the Users & Groups data file must be the same for privileges to be properly restored.

If you do not have such a backup utility, here are alternate methods:

If The Shared Data Is On An External Hard Drive

1. Shut down the old server and the new server.
2. Connect the external hard drive to the new server (make sure you've already transferred Users & Groups by this point).
3. Turn on external hard drive and boot new server.
4. Launch Web & File Services, and verify that external hard drive has privileges intact.

If desired, use the "Duplicate Folder" command of the Web & File Admin program to copy share points from the external drive to an internal drive.

If The Shared Data Is On An Internal Hard Drive

If the shared data is on an internal hard drive, you have several options:

Install the internal drive in the new server,

or

Use Server Admin's "Copy Volume" or "Duplicate Folder" (depending on version you're using) command to move the data from an internal to a spare external drive, then follow instructions above for moving data on an external drive.

Note that "Duplicate Folder" and "Copy Volume" commands only work on local disks. You cannot use these commands to copy data to a shared volume mounted on the server's desktop.

AppleShare Client 3.8: Read Me

This article provides information on AppleShare Client 3.8.
This article has been archived and is no longer updated by Apple.
Note: AppleShare Client 3.8.1 has been released but the Read Me is the same as AppleShare Client 3.8.

AppleShare Client 3.8 was released on July 28, 1998. It requires System Software 7.6 or later, Open Transport 1.1.2 or later.

AppleShare Client 3.8 can be installed on the following international versions of Mac OS as well as North American English Mac OS: British, Bulgarian, Czech, Danish, Dutch, Finnish, French, German, Italian, Japanese, Korean, Norwegian, Polish, Portuguese, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish. In order for AutoRemounter functionality to work properly, AppleShare Client 3.8 requires AutoRemounter Control Panel version 1.3, which is included with Mac OS 8.1.

Description:

This software allows you to connect a Mac OS computer to an AppleShare file server. Computers that are running system software earlier than system software 7.5.1 should use AppleShare Workstation 3.5. Computers that are running system software 7.5.1 or later (up to but not including 7.5.3) should use AppleShare Workstation 3.6.5. Computers running system software 7.6 or later should use AppleShare Client 3.8. Please refer to the Read Me file included with with this software for complete details. Please refer to the documentation included with with this software for complete details.

Instructions:

This software is available two different ways. Either method of obtaining this software will provide you the exact same software.

(a.) One self-mounting Disk Copy image

(b.) 5 parts of a self-mounting Disk Copy image

If you choose (a.), download this self-mounting image to your hard drive and then double-click it to mount the compressed disk image on your desktop. Please read the documents included on this disk image before installing the software.

If you choose (b.), download all 5 parts to your hard drive and then double-click on the first part to mount the compressed disk image on your desktop. Read the documents included on this disk image before installing the software.

You may wish to download the 5 parts instead of the individual self-mounting image if you are a using a modem connection or if you wish to transport AppleShare Client 3.8 to another machine via floppy disk.

Key Changes from AppleShare Client 3.7.2 & 3.7.4

- Works correctly with the AutoRemounter 1.3 control panel.
- Dialogs center correctly when the user has more than one monitor.
- Aliases made of servers mounted via AppleTalk will not try to switch to TCP/IP. If you want a TCP/IP alias, you must first mount the server via TCP/IP.
- Much of the Login process is asynchronous, you can cancel out of the connection attempt.
- The 3.8 Client supports a new, transport independent UAM (User Authentication Module) Interface. This allows UAM plug-in modules to connect to Servers using AFP over TCP/IP. You will need to contact your UAM vendor to obtain a new UAM that conforms to this interface. The old UAMs will still work.

Using the New Features of the AppleShare Client 3.8 Software

The AppleShare Client 3.8 software automatically uses TCP to make connections when users choose an AppleShare IP file server that is set up for TCP connections. If you want to use AppleTalk to make the connection, press the Option key when you double-click the name of an AppleShare IP file server in the "Select a file server" list in the Chooser window or when you click the OK button in the Chooser window.

When you want to use TCP to connect to an AppleShare IP file server that does not appear in the "Select a file server" list in the Chooser window, click the Server IP Address button. When you click the Server IP Address button, a dialog box appears in which you can type the DNS name (such as shasta.acme.com) or the IP address of the AppleShare IP file server (such as 172.16.156.52).

If the AppleShare IP file server is running on a computer behind a firewall, you can reach it by appending a colon (:) and the TCP port number (by default, 548) to the IP address or DNS name.

Known Incompatibilities and Limitations

- If you have problems using AppleShare Client 3.8 to connect to an AppleShare IP file server, use MacTCP Ping (available from Apple

Computer) to make sure that you can ping the computer that is running the AppleShare IP file server software. If you can't ping successfully, there is a connectivity issue. Check cabling and the configuration of the TCP/IP control panel.

- AppleShare Client 3.8 does not work with versions of RunShare prior to version 3.0. Computers on which they are both installed will stop responding. Be sure to upgrade to RunShare version 3.0 or later before you install the AppleShare Client 3.8 software.
- If a user makes an alias to an AppleShare IP volume and uses TCP to connect to that volume, AppleTalk must be active on the user's computer. AppleTalk must be active due to an issue with the Alias manager.
- The AppleShare IP 5.0 Web & File Server uses a new set of access privileges based on combinations of the original access privileges (See Files, See Folders, and Make Changes). The new privileges are Read Only, Read & Write, Write Only, and None. When you connect to an AppleShare IP file server volume and choose Sharing from the Finder's File menu, the dialog box that appears displays the original AppleShare access privileges. If you use the dialog box to change a folder's privileges to a combination of privileges that is invalid on the AppleShare IP file server, the file server automatically applies the most secure access privilege that approximates the change. If you close the dialog box and choose Sharing again, the checkboxes that are checked may be different than the checkboxes that you checked earlier. Mac OS 8 Finder Sharing dialog box uses the AppleShare IP access privilege model.
- When you install Open Transport 1.1.2 on a PowerBook 3400, immediately install the Mac OS 7.6.1 Update for PowerBook 3400. The update fixes a situation that could cause the computer to stop responding when you switch between Infrared and LocalTalk.
- Some old HyperCard XCMDs that mount AppleShare volumes do not work with the AppleShare Client 3.8 software.
- Microsoft Office Manager (Office 4.2.1) causes the AppleShare Client 3.7 software to stop responding when you try to connect to an AppleShare file server. To correct this situation, install Office Manager Updater, available from Microsoft.
- NetWare User Authentication Modules (UAMs) earlier that 5.11 do not work with AppleShare Client 3.7 and later. Contact Novell for an update.
- Utilities that mount disk images from AppleShare File Servers may have issues with the AppleShare Client 3.8 software. If you have issues, contact the vendor for a new version.
- Versions of Santorini Server Manager earlier than 4.0 are not fully functional when used with the AppleShare Client 3.8 software. Santorini Server Manager 4.0 is available on the AppleShare IP 5.0 Companion CD-ROM disc. Otherwise, contact Santorini for an update.
- Server management applications that mount AppleShare volumes may have issues with the AppleShare Client 3.8 software. Contact the vendor for an update.
- If there are volumes set to mount at startup and the server administrator disables the "Enable users to save password for automatic log on" checkbox in Web & File Admin, you will be unable to change the startup mounting settings for those volumes. If this happens, throw away the AppleShare Prep file in the Preferences folder inside the System Folder, and reselect the server volumes you wish to mount at startup.
- In order to allow startup mounting via TCP be sure to delete the AppleShare prep file in the preferences folder, and reselect the volumes you wish to have mount at startup. This ensures that the TCP address of the server will be saved in the AppleShare prep file.
- If you are having difficulty making the Client use TCP/IP for startup mounting try setting TCP/IP to always load. If that doesn't work, try turning on VM (this will allow the OT libraries to load in less memory).
- If you have a pre ASIP 5.0 server set to mount at startup and the server is upgraded to ASIP 5.0 (or later), you should throw away the AppleShare Prep file and reselect the server volumes you wish to mount at startup. This will prevent issues with server volumes mounting twice.
- If you are receiving "Server not responding" errors when connecting via TCP over PPP, use the AppleShare Client Setup utility (available on the AppleShare IP Web site at to increase the TCP Lookup timeout from 20 seconds to the time it takes your PPP link to come up plus 20 seconds.
- If the Chooser stops responding for 2 minutes when trying to connect to a TCP server, use the AppleShare Client Setup utility (available on the AppleShare IP Web site at to reduce the TCP Connect Timeout from 120 seconds to 20 seconds. Reducing the TCP Connect Timeout may make connecting to AFP servers over the Internet impossible.
- If you have TCP/IP set to use PPP to connect, and open an alias to an ASIP server (or any other that supports AFP over TCP/IP), the Client will try to connect using TCP/IP first before using AppleTalk. If you do not want this, you may use the the AppleShare Client Setup utility to disable TCP/IP support in the Client.
- If you have an alias to a server that supports AFP over TCP/IP, and the server is behind a firewall that doesn't allow pings through, you will not be able to connect via the alias unless you use the AppleShare Client Setup utility (available on the AppleShare IP Web site at to disable address verification via pings.
- If you have a Global Village K56 flex card modem and are using OT PPP 1.0.1 to provide TCP/IP connectivity, you need to disable the menubar status lights, or launch PPP manually and connect to your ISP, before using the Chooser to connect to an AppleShare file server over TCP/IP.
- If the Chooser hangs when mounting volumes (after the OK button has been clicked in the volume list dialog). Try disabling the Apple Menu Options Control Panel.
- If you experience crashes while mounting a volume as the Administrator after you have mounted a sharepoint contained on the volume as a regular user, be sure to mount a different volume in between. The sequence should be:
    1. mount sharepoint as user
    2. unmount sharepoint
    3. mount other server volume
    4. mount volume as administrator
    5. unmount other volume.

  This issue will be fixed in a future version of the Finder.

This article mentions an Apple software update. You may search for software updates at the Apple Software Updates Web site at http://www.apple.com/swupdates.

eMate 300 Update 2.1 (737246)

This article provides information on eMate 300 Update 2.1 (737246).
This article has been archived and is no longer updated by Apple.

eMate(TM) 300 Update 2.1 (737246)

Description:

This package contains the latest System Update for eMate 300. All customers should load this package onto their eMate 300.

This document describes the product enhancements included in the system update file named "eMate 300 Update 2.1 (737246)." The eMate 300 Update 2.1 (737246) is for Apple eMate 300 customers in the United States.

eMate(TM) 300 Update 2.1 (737246) version 737246 was released on July 22, 1998. It requires an eMate 300 and any Mac OS package installer. This version will install over the following system software version for eMate 300:

- version 2.1 (737041)

Important: Before you install any system update, you should back up your Apple eMate300 using the Newton Connection Utilities application or a PC storage card (also known as a PCMCIA card). For more information, see the documentation that came with the software or your eMate 300. Apple is not responsible for any lost data.

eMate(TM) 300 Update 2.1 (737246) is provided to you free of charge. It does not include free telephone support from Apple Computer.

Instructions:

This software consists of a self-extracting archive. To use, download it to your hard drive and then double-click it to decompress the software.

Checking battery status

- The battery level indicator in the Extras Drawer now accurately displays the amount of battery charge. The fix allows the eMate to get a full first charge cycle on new batteries and provides a normal battery run time.

Memory

- In earlier system software versions, the eMate may seem to not have enough memory when in fact it does. This issue is fixed.

Printing

- You can now print to a StyleWriter 6500 printer over a LocalTalk network. This requires the 3.0 version of the StyleWriter 6500 printer driver as well as this system update.
- In earlier system software versions, if you printed ink text to a StyleWriter Printer 4500 or 6500 at 600DPI, your eMate would stop responding. This issue is fixed so that when you print, the text gets truncated if there is a full text buffer. More text may be printed if the printer's DPI is set to 300.
- Flipped shapes are printed correctly to PostScript printers.

Faxing

- Text on the cover page of a fax is now clear.
- You can drop or add fax numbers before faxing a document without getting an error message.
- You can access eMates on extended networks that previously appeared not to be visible.

Using PC cards

- The eMate 300 can now recognize a greater variety of PC cards.
- In earlier system software versions, you might get the message "Newton still needs the card..." when certain communication cards are ejected. This issue is fixed.

DOS Format Fixer 1.0

This article is about DOS Format Fixer 1.0
This article has been archived and is no longer updated by Apple.

DOS Format Fixer 1.0

DOS Format Fixer version 1.0 was released on July 28, 1998. It requires North American English Mac OS 7.6, 7.6.1, 8.0 or 8.1.

DOS Format Fixer 1.0 is a utility that corrects format information on some DOS format floppy disks for use with PC Exchange 2.1.1 (referred to as PC Exchange in this update). The DOS Format Fixer 1.0 will prevent some kinds of corruption. If you have a floppy disk that is already unusable, DOS Format Fixer 1.0 will not repair the damage. Floppy disks formatted with Windows 3.1 or DOS 5.0 can experience data corruption when they are used on a Macintosh with PC Exchange. This issue is resolved in PC Exchange 2.2, which is included with Mac OS 8.1. If you are using Mac OS 8.0, you can download the Mac OS 8.1 Update for free. If you are using Mac OS 7.6 or Mac OS 7.6.1, you can use the DOS Format Fixer 1.0 to avoid the situation.

Technical Information

Certain floppy disks have erroneous information written to the first sector. Floppy disks normally have a 12-bit file allocation table (FAT), but the floppy disks with erroneous information have "FAT16" written to the first sector. This indicates to PC Exchange that the floppy disk should have a 16-bit FAT when it actually has a 12-bit FAT. This causes PC Exchange to incorrectly read the FAT and PC Exchange subsequently may either overwrite data in used sectors or read data from the wrong sectors. The DOS Format Fixer 1.0 changes the data on the first sector of the floppy disk. It replaces "FAT16" with "FAT12" so PC Exchange will now treat the floppy disk as having a 12-bit FAT.

Instructions:

This software consists of a self-mounting Disk Copy compressed image (.smi) file. Download this software to your hard drive and then double-click it to use it. You do not need Disk Copy to access .smi files.

Follow the steps below to use DOS Format Fixer 1.0. It is recommended that you check your floppy disks using Scandisk or some other disk repair utility in DOS or Windows first, as the DOS Format Fixer 1.0 does not repair floppy disks that have already become unusable.

1. Turn off PC Exchange by opening the PC Exchange control panel and clicking the "Off" button.
2. Open DOS Format Fixer 1.0. A message will remind you to turn off PC Exchange. Click OK.
3. Make sure DOS Format Fixer 1.0 is the active application.
4. Insert each floppy disk you wish to fix. DOS Format Fixer 1.0 will correct the first sector on the floppy disk and then eject it.
5. After all floppy disks have been fixed, quit DOS Format Fixer 1.0.
6. Turn PC Exchange back on.

You will now be able to use the floppy disks with any version of PC Exchange.

HyperCard 2.4 Update

This article has information on the HyperCard 2.4 Update.
This article has been archived and is no longer updated by Apple.
HyperCard 2.4 Update was released on April 26, 1998. It requires US English Hypercard 2.3 or 2.3.5.

Description:

This HyperCard 2.4 Update adds some new features, including QuickTime functionality, and fixes issues with the HyperCard application. This product updates HyperCard 2.3 or 2.3.5 to HyperCard 2.4. The full release of HyperCard 2.4, bundled with software including QuickTime 3.0, and new Help stacks and manuals, is available at your Apple-authorized dealer.

Instructions:

This software is available two different ways. Each method of obtaining this software will provide you the exact same software.

(a.) One 5.4 MB self-mounting Disk Copy image
(b.) 5 parts of a 5.4 MB self-mounting Disk Copy image

If you choose (a.), download this self-mounting image to your hard drive and then double-click it to mount the compressed disk image on your desktop. Please read the documents included on this disk image before installing the software.

If you choose (b.), download all 5 parts to your hard drive and then double-click on the first part to mount the compressed disk image on your desktop. Read the documents included on this disk image before installing the software.

You may wish to download the 5 parts instead of the individual self-mounting image if you are a using a modem connection or if you wish to transport HyperCard 2.4 Update to another machine via floppy.

New Features

Several exciting features have been added with the release of HyperCard 2.4, including:

- an improved movie button task that allows you to open any QuickTime-readable file
- ability to open movie and some image files by dragging them onto the HyperCard application icon
- a new Link to URL button task and HyperTalk command for connecting to a web site
- ability to manipulate QuickTime movies using HyperTalk
- keyboard navigation of QuickTime VR movies
- ability to open a nearly unlimited number of files using HyperTalk
- enhanced script editor window for easier navigation
- improved Picture XCMD
- more script commands and new syntax

For more information on these features and how to use them, see Using HyperCard 2.4.

Issues Fixed In This Update

These changes have been made to HyperCard since version 2.3.5:

- Fixed an issue that prevented HyperCard's floating windows from collapsing properly under Mac OS 8.0 or later.
- Fixed an issue that could cause the system to stop responding when a very large stack was opened on a fast computer.
- Fixed an issue that occurred on PowerPC-based computers when a field contained more than 32K of text and style information.
- Fixed an issue that could cause the movie command callback ExtToStr to return bad data.
- Fixed an issue that prevented HyperCard from properly playing uncompressed 16-bit mono sounds.
- HyperCard now quits properly when a script window is active.
- The beta character in the Symbol font is no longer treated as a word delimiter in fields.

For more product information, see these Web sites using your Web browser application:

iMac: Microphone Only Records At 44.100 kHz Sampling Rate

Summary:
Using SimpleSound version 1.1 on an iMac computer sounds can only be saved at a sample rate of 44.100 kHz.

This article describes how to change the sample rate to 22.050 kHz on iMac computers.
This article has been archived and is no longer updated by Apple.
The iMac computer supports 16-bit CD-quality stereo input/out; additionally, the iMac computer has a fixed sampling rate of 44.100 kHz. Since the sampling rate is fixed at 44.100 kHz, sampling at 22.050 kHz is not possible on iMac computers.

How to resample sounds to 22.050 kHz

The iMac computers ship from Apple with QuickTime 4 basic edition. One of the most useful applications included with QuickTime 4 is QuickTime Player. With QuickTime 4 basic, QuickTime Player is simply a media player. With the QuickTime Pro Player, users can import/export any sound document into and out of QuickTime Player. For information on updating QuickTime 4 to the Pro version, check out Apple's QuickTime web site on the internet at:

<**http://www.apple.com/QuickTime/**>

QuickTime Player can easily downsample SimpleSound documents to lower sample rates. To downsample a SimpleSound document to a lower sample rate, QuickTime Pro users can do the following:

1. After saving the sound document using SimpleSound, open the document using QuickTime Player.
2. Confirm the sound document's Sample Rate by choosing "Get Info" from the Movie menu and select Sound Track from the left pop-up menu and Format from the right pop-up menu. You should see 44.1 kHz.
3. Close the sound document's Get Info window.
4. Choose Export... from the File menu.
5. Select which type of file you want to export (Movie, AIFF, System 7 sound, Wave or ulaw).
6. Click the Options... button.
7. Click the Settings... button in the sound section of the dialog box.
8. Pick the new sampling rate you want by picking the pop-up menu next to kHz.
9. Click OK twice.
10. Click the save button.

You will have your sound at the new sampling rate.

Why Resample?

Sounds stored in 44.100 kHz can take up large amounts of file space. For example, one minute of music audio can be 10 MB in size using 44.100 kHz, whereas by resampling the same audio to 22.050 kHz the file will be 5 MB in size. Further reduction to the file can be made using various compression formats. However, as a general rule, as audio files are compressed and resampled, they lose quality. Depending on type of audio file this may be acceptable.

USB: Transfer Speed Compared to Other Technologies

This document compares the data transfer rates of USB and different peripheral technologies such as ADB, Serial, SCSI, and FireWire.
This article has been archived and is no longer updated by Apple.
Below is a comparison of speeds of different technologies, from slowest to fastest. Please note that these are theoretical maximum throughputs of the different technology.

Technology	Theoretical Maximum Throughput
Apple Desktop Bus (ADB)	0.01 Mbps or 10 Kbps
Serial Port	0.23 Mbps or 230 Kbps
Geoport Port	2 Mbps
USB 1.1 at low data transfer rate	1.5 Mbps
USB 1.1 at high data transfer rate	12 Mbps
FireWire 400	400 Mbps
SCSI	1-40 MB/sec
Fast SCSI	8-80 MB/sec
Ultra SCSI-3	18-160 MB/sec
USB 2.0 at high data transfer rate	480 Mbps
FireWire 800 at 800 Mbps	800 Mbps

Published Date: Feb 20, 2012

iMac: How To Force a Restart

Summary:
Sometimes the Command-Control-Power key combination does not always force the iMac computer to restart when the computer stops responding. This article provides other restart methods for the iMac computer.
This article has been archived and is no longer updated by Apple.
Because the iMac uses a USB keyboard, there may be occasions when you cannot restart it using the Command-Control-Power keys during startup or following a system crash. In such cases it may be necessary to use the hardware reset button. There are unique methods for performing a hardware reset depending upon which model iMac you have.

Original iMac

To get to the reset button, open the cover on the right side of the iMac and locate the reset hole between the Ethernet and modem ports. It has a small triangle icon next to it. Carefully insert the end of a large straightened paper clip into the hole and push gently on the button inside. Do not use excessive force. Your computer should restart.

If the reset button fails to force a restart, unplug the computer, wait at least 30 seconds, then reconnect the power plug and turn the computer back on in the normal way.

iMac (Slot Loading) and iMac (Early 2001)

The iMac (Slot Loading) does not require the use of a paper clip as the reset and interrupt switches now have a button to activate them. The reset and interrupt buttons are located below the modem port on the right hand side of the iMac (Slot Loading). The reset button is marked with a small triangle and is the front-most of the two buttons.

In the event that the iMac's Reset button does not reset your computer, press and hold power button on the front of the computer for at least 5 seconds to force a restart. If this fails, remove the power cord from the wall and then reconnect it.

Power Macintosh G3 Ethernet (Built-In) Driver v2.0.4

This article provides a description and installation instructions for Power Macintosh G3 Ethernet (Built-In) Driver v2.0.4.
This article has been archived and is no longer updated by Apple.
Power Macintosh G3 Ethernet (Built-In) driver version 2.0.4 was released on May 8, 1998. It has been posted to the Apple Software Updates Web site at http://www.apple.com/swupdates.

Requires:

- Power Macintosh G3 Desktop (233, 266, 300)
- Power Macintosh G3 Minitower (233, 266, 300)
- Power Macintosh G3 All-in-one (233, 266)
- Power Macintosh Server G3 (233, 266, 300)
- PowerBook G3 Series (233, 250, 292)

Description:

This driver is used by the Power Macintosh G3 built-in Ethernet interface. The 2.0.4 driver fixes a problem present in the 2.0, 2.0.1, 2.0.2, and 2.0.3 drivers, where there is a possibility that the system could lose network services when using the built-in Ethernet interface with the machines listed above. Please refer to the Read Me file included with with this software for complete details.

Instructions:

This software consists of a Disk Copy NDIF (New Disk Image Format) self-mounting compressed image. Download this software to your hard drive and then double-click it to use it.

Products Affected

- Power Macintosh G3 Desktop (233, 266, 300)
- Power Macintosh G3 Minitower (233, 266, 300)
- Power Macintosh G3 All-in-one (233, 266)
- Power Macintosh Server G3 (233, 266, 300)

This document provides information about version 2.0.4 of the Power Macintosh G3 Ethernet (Built-In) driver. The driver is used by the Power Macintosh G3 built-in Ethernet interface. The 2.0.4 driver fixes a problem present in the 2.0, 2.0.1, 2.0.2, and 2.0.3 drivers.

Loss of Network Services

Using the 2.0, 2.0.1, 2.0.2, or 2.0.3 driver there is a possibility that the system could lose network services when using the built-in Ethernet interface.

In some situations a dialog might be displayed:

"Access to your AppleTalk Network is no longer available.
When the network becomes available again, a message on your screen will notify you."

In other situations no dialog would be displayed but any attempt to use Ethernet-based services would fail. For example, opening the Chooser would result in no zones and no devices being listed.

Identification

The Ethernet driver is located in the "Extensions" folder which is located inside the "System Folder". To determine if you have the 2.0, 2.0.1, 2.0.2, or 2.0.3 version of the driver, do the following:

1. Double click on the "System Folder" icon to open the folder.
2. Double click on the "Extensions" icon to open the folder.
3. Locate the file "Ethernet (Built-In)".
4. Click once on the file to select it.

5. Select "Get Info" from the "File" menu to view the version information.

If you have version 2.0, 2.0.1, 2.0.2, or 2.0.3 you will need to upgrade the driver. Please use the following instructions to upgrade the driver.

Installation

The following procedure will install the new driver into the Extensions folder replacing the old driver. To install the 2.0.4 Ethernet driver, do the following:

1. Drag the new driver "Ethernet (Built-in)" on to your "System Folder" icon.

2. The following dialog box will be displayed:
"This extension needs to be stored in the Extensions folder in order to be available to this computer. Put "Ethernet (Built-in)" into the Extensions folder?"
Click "OK" to continue.

3. The following dialog box will be displayed:
"An older item named "Ethernet (Built-in)" already exists in this location. Do you want to replace it with the one you're moving?"
Click "OK" to continue.

4. Reboot.

5. Verify the new driver is installed by following the steps under "Identification". The new driver will display as version 2.0.4.

iMac: Infrared Does Not Work With TV Remote Controls

Although the iMac has an infrared receiver, like the Power Macintosh 5200 computer, the remote control from the Power Macintosh 5300 cannot be used with the iMac.

This article has been archived and is no longer updated by Apple.

The infrared feature of the iMac is unlike the one-way infrared receivers of previous Power Macintosh 5xxx and 6xxx series computers. It is intended for two-way communications with other compatible IrDA-compliant devices and does not respond to the television-type remote controls used with the Apple TV/Video systems of those earlier Macintosh models.

AppleShare IP 6.0: Using Secure Printing

This article explains how to use secure printing with AppleShare IP 6.0.
This article has been archived and is no longer updated by Apple.
The Print Admin application in AppleShare IP 6.0 provides security features to help network administrators manage access to printers and printer queues. When creating or editing a queue in the Print Admin program you see a security tab. This tab enables the administrator to provide "casual" security features to print queues. The administrator is able to restrict access to specific users and groups, and to require a password.

When specifying which users have access to a queue, the user name must match the owner name for the computer. This is because the owner name is inserted into the postscript document when it is created, using the DSC command %%For. The print server checks to see if the owner name inserted into the PostScript document matches any users in the authorized user list. If these names do not match an error message such as "A PostScript error has occurred. Go to Finder for details" may appear. (There may be no further details in the Finder). Check the print queue's Server Log to see if there is Security Violation error. If so, adjust the names so that they match by changing the owner name to match a current user, or by changing the user name in the Users & Groups list so that it matches the owner name on the user's computer.

Troubleshooting:

To verify that the owner name of the client and the user name on the server match:

1. Open the client's File Sharing control panel (pre Mac OS 8 open the Sharing Setup control panel).
2. Determine the owner name of the computer.
3. Using the ASIP Print Server Admin application, open the queue in question for editing.
4. Verify that one of the names in the list of users approved to print to the queue matches the owner name on the client's workstation.
5. If the entries do not match, change either the owner name on the workstation, or the user's name on the server so that they match.

Some operating systems, including Window NT, use PostScript drivers that do not work with the %%For command as outlined above. On these operating systems using a secure queue is not possible using the default print driver.

Mac OS clients require LaserWriter 8 version 8.6.1 or higher to take advantage of secure PostScript print queues. LaserWriter 8.6.1 and higher are designed for Power Macintosh clients only. (They do not work with computers that have a 68000-family microprocessor.)

If the user is trying to use the secure feature on a Windows computer:

1. Verify that a compatible PostScript driver is installed by printing a document to a file, not the printer.
2. Open the document in a text editor and look for the %%For command.

AppleShare IP: Support For Server-Side Includes And Plug-ins

This article describes server-side includes and plug-ins that may allow them to work with AppleShare 5.0.2 and later.
This article has been archived and is no longer updated by Apple.
A server-side include is an instruction contained in the HTML source of a web page that instructs the web server to include another section of HTML from elsewhere on the server within this web page. Server-side includes are often used to display common information within different pages on the same site. The use of server-side includes will increase the load on the web server, since it requires the server to parse each page before displaying it.

Neither AppleShare IP nor Personal Web Sharing provide inherent support for server-side includes. However, AppleShare IP version 5.0.2 and later provide support for plug-ins that work with the WebStar API. Some third-party plug-ins may provide support for server-side includes on your AppleShare IP web server. For more information on using plug-ins with AppleShare IP, please see the following article:

Article 45066: "AppleShare 5.0.2: Addendum Notes"

Personal Web Sharing version 1.5.x and earlier do not work with plug-ins.

ARA 3.0: "AppleTalk Network Not Available" Message

This article describes an intermittent issue resulting in a message stating "Access to your AppleTalk Network has been interrupted." In some cases AppleTalk services become available again, in other cases the AppleTalk network does not become available again.
This article has been archived and is no longer updated by Apple.
There is a known issue with Apple Remote Access 3.0. ARA processes incoming Router Table Maintenance Protocol (RTMP) packets. ARA 3.0 incorrectly processes these packets. On certain networks, this can cause the Macintosh to assume that the network is inaccessible. An alert is posted to notify the user that access to the AppleTalk network has been interrupted. If additional RTMP packets are processed correctly, the network is assumed to be available again.

This issue is resolved in ARA 3.0.2 and later. ARA 3.0 users may download and install the ARA 3.0.2 Updater to resolve this issue. The Personal Server and client updates are available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

ARA Client versions 3.1.2 and later (included with Mac OS 8.5 and later) also contain this fix, so there is no need to update these versions.

Note: iMac Rev. A (Mac OS 8.1) and PowerBook G3 Series systems that shipped with Mac OS 8.1 use ARA 3.0 as the remote access client. Therefore, customers with these systems may encounter this issue and not realize that it is being caused by Remote Access.

Newer systems shipping with Mac OS 8.5 include ARA 3.1.2 which has resolved this issue.

For The Technically Curious

ARA processes incoming RTMP packets. The RTMP packets consist of tuples that contain network information. Extended network information is contained in 6 byte tuples and non-extended network information is contained in 3 byte tuples. ARA 3.0 maintains a pointer that moves down the list of network tuples.

The bug description: Instead of moving the pointer by 6 bytes for extended networks, the pointer would only move 3 bytes. Eventually, ARA would be reading non-valid data which would result in the determination that the network was no longer valid.

iMac: Using Multiple Internet Access Configurations

This article describes how to setup multiple internet configurations using Internet Setup Assistant.
This article has been archived and is no longer updated by Apple.
Internet Setup Assistant is an easy way to quickly enter internet access and configuration information. Internet Setup Assistant automatically configures AppleTalk, Modem, Remote Access and TCP/IP control panels under the configuration name you provide.

Most dialup connections rely on a server to provide internet (network) information. When relying on a server, one setting in each AppleTalk, Modem and TCP/IP control panel can be used for multiple connections.

Apple Remote Access offers the ability to save multiple unique dialup configurations. Start by using the Internet Setup Assistant to enter a descriptive name for each setup you need, for example, Home or Work. Each time you do this, Internet Setup Assistant will add a configuration to your Remote Access preferences.

For convenience, Apple has provided a Remote Access control strip module (pre-installed) that allows you to change configurations quickly from the control strip. The control strip can be used to change configurations, connect and disconnect, and show time connected or remaining.

The AppleTalk, Modem and TCP/IP control panels can also have multiple configurations, or in some cases, it may be necessary to set "manual" configurations that do not use a server to provide the computer with internet (network) information. In these cases, you may have more than one setting in each control panel.

An alternative to manually switching configurations from each control panel is to install Apple Location Manager from the iMac Software Install CD. Location Manager allows settings to be saved as a group, so that selecting a Location Group from the control strip makes changes to all settings: AppleTalk, Dial Assist, Modem, TCP/IP, Remote Access. In our example, a Location called "Work" includes AppleTalk, Remote Access and TCP/IP settings. By changing the location to "Work" using the control strip, all three settings are quickly changed and ready for use.

To install Apple Location Manager, locate the program "Mac OS Install" on the iMac Software Install CD. After launching the Mac OS Install program, select the option to "add/remove" software. A list will appear, allowing you to select Apple Location Manager in the custom install list. The installer will only install that portion of the software necessary for use with Apple Location Manager.

For more information, please see the following Knowledge Base article:

AppleShare IP 6: Print Server FAQ

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 Print Server, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. Does the AppleShare IP Print Server provide logging that can be used for accounting purposes?
2. Can I store fonts on the Print Server for use by everyone sending print jobs to its queues?
3. Is it possible to run the Print Server component of AppleShare IP on a 680x0 computer?
4. Does the new AppleShare IP 6 Print Server handle print jobs sent over TCP/IP?
5. Does the new Print Server work with the LaserWriter 8 driver?
6. Does the AppleShare IP 6 Print Server work with the LaserWriter 8.5 IP printing features?
7. Does the new AppleShare IP 6 Print Server work with queue names with spaces?
8. Do print queues error logs note the IP address of the printer or the queue in question?
9. Does secure printing work for non-Mac clients?
10. Does AppleShare IP 6 Print Server work with localtalk printers?
11. How are print jobs assigned to the printers in a queue?
12. Can I use the "Allow binary data" and "Allow color printing" options for IP print queues?
13. Can I print a Postscript file that another client gave me?

Question 1: Does the AppleShare IP Print Server provide logging that can be used for accounting purposes?

Answer: This is not currently available with AppleShare IP 6.0.Â

Question 2: Can I store fonts on the Print Server for use by everyone sending print jobs to its queues?

Answer: No. The client will have to store needed fonts locally.

Question 3: Is it possible to run the Print Server component of AppleShare IP on a 680x0 computer?

Answer: No, the new Print Server is a PowerPC native application, and cannot run on 680x0 computers. With the introduction of AppleShare 4.2, the server software is now only PowerPC compatible.

Question 4: Does the new AppleShare IP 6 Print Server handle print jobs sent over TCP/IP?

Answer: AppleShare IP 6 supports IP and LPR printing from any client including Mac, WinTel, and Unix.

Question 5: Does the new Print Server work with the LaserWriter 8 driver?

Answer: The AppleShare IP 6 Print Server requires LaserWriter 8 version 8.4 or later.

Question 6: Does the AppleShare IP 6 Print Server work with the LaserWriter 8.5 IP printing features?

Answer: AppleShare IP 6 works with the IP printing feature in this Apple-provided driver.

Question 7: Does the new AppleShare IP 6 Print Server work with queue names with spaces?

Answer: Spaces are handled correctly with AppleTalk queues. LPR queues with spaces in the Queue name will be recognized by the client up to the first space. Thus, if a LPR client wants to print to the "Accounting Dept" queue--the queue name to select is "Accounting." Leading spaces are not recognized.

Question 8: Do print queues error logs note the IP address of the printer or the queue in question?

Answer: Error logs will identify the IP address of the printer to note error conditions.

Question 9: Does secure printing work for non-Mac clients?

Answer: Yes. However, a limitation in Windows NT print drivers is not compatible with secure printing for print queuing.

Question 10: Does AppleShare IP 6 Print Server work with localtalk printers?

Answer: The AppleShare IP 6 Print Server works with LocalTalk laser printers that use the LaserWriter 8 driver. Printers that cannot use the LaserWriter 8 driver cannot be used with the AppleShare IP 6 Print Server.

Question 11: How are print jobs assigned to the printers in a queue?

Answer: Print jobs are assigned in a round robin fashion. The printer server will ping the printers until one is available to send a new print job. You can drag jobs to a specific printer while at the Print Server Admin console.

Question 12: Can I use the "Allow binary data" and "Allow color printing" options for IP print queues?

Answer: No. They are only available to AppleTalk printers.

Question 13: Can I print a Postscript file that another client gave me?

Answer: Yes. However, if secure printing is activated, printing the Postscript file may not work.

How To Use America Online To Register With Apple

This article describes how to register an Apple product via America Online.
This article has been archived and is no longer updated by Apple.
If you wish to use America Online to register your iMac over the Internet, open America Online and connect to the Internet. Go to the AOL Web Browser, and enter the following Apple Registration Server URL:

http://www.apple.com/register/

If you would rather NOT use the AOL Web Browser, after you open America Online and connect to the Internet, open the "Register with Apple" application on the desktop.

Once you see the dialog window above, click the "Connect Now" button. This opens the configured browser and takes you to the Apple Registration Server.

Note: The only purpose of the "Register with Apple" application is to take you to the Apple Registration Server (www.applereg.com) through the Internet browser of your choice.

For more information on the "Register with Apple" application, please see article 58025: "**iMac: How To Get Onto The Internet**"
Published Date: Feb 20, 2012

AppleShare IP 6: Web Service FAQ, Part 1

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 Web Service, with answers to those questions. For the second part of this article, see article 88011: "**AppleShare IP 6: Web Service FAQ, Part 2"**

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. Does guest access need to be on to allow Web access?
2. Are there any common CGI's that do not work with with AppleShare IP 6?
3. Does the AppleShare IP 6 Web Server work with keep-alive requests?
4. Does the AppleShare IP 6 Web Server binhex Macintosh files on-the-fly?
5. Does the AppleShare IP 6 Web Server have WebStar API plug-in support?
6. How many simultaneous connections can this Web Server handle?
7. Is it possible to change error messages that are returned by the server?
8. What is MIME?
9. I'm a WebStar customer moving to ASIP. How do I get "default.html" files to load as the default file when requesting an HTTP directory?

Question 1: Does guest access need to be on to allow Web access?

Answer: No. But if Guest log-in is not enabled, only registered users, who have at least Read access to the Web Folder, will be able to access. If you want the public to access your web site, the Guest log-in must be enabled and the guest must have at least Read access to the Web Folder.Â

Question 2: Are there any common CGI's that do not work with with AppleShare IP 6?

Answer: Due to the huge number of publicly available CGI's, Apple cannot test them all for compatibility. If they are written to the WebStar CGI API or version 1.2 of the WebStar plug-in API, they should be compatible. Please contact the CGI or plug-in developer for this information.

Question 3: Does the AppleShare IP 6 Web Server work with keep-alive requests?

Answer: Yes. Support of keep-alive requests, now used by most popular browsers, effectively doubles the number of requests per second the server can handle.

Question 4: Does the AppleShare IP 6 Web Server binhex Macintosh files on-the-fly?

Answer: Yes. When the URL for a HTTP request ends with the .hqx suffix, the corresponding file is automatically converted to binhex format.

Question 5: Does the AppleShare IP 6 Web Server have WebStar API plug-in support?

Answer: Yes. Support for WebStar API plug-ins was introduced in AppleShare IP 5.0.2.

Question 6: How many simultaneous connections can this Web Server handle?

Answer: The number of simultaneous connections is limited by your physical network connection and amount of RAM installed on your AppleShare IP 6 Server.

Question 7: Is it possible to change error messages that are returned by the server?

Answer: Yes. For AppleShare IP 6, error messages files are now contained in Error Files folder inside the Web Folder. You can edit or delete these files at will.

Question 8: What is MIME?

Answer: MIME stands for Multipurpose Internet Mail Extensions. It is the standard for attaching non-text files to standard Internet mail messages. Non-text files include graphics, spreadsheets, formatted word-processor documents, sound files, and so forth.
MIME types are also used by web servers. When responding to a request, the ASIP web server returns the MIME type of the data along with the response data. The web browser on the client uses the MIME type information to determine how to process and display the data. Handlers for common MIME types are built into popular browsers. For specialized MIME types such as audio and video files, web browsers invoke external applications designed to handle specific MIME types.
Note: Apple does not provide technical support to customers using the ResEdit application to modify Resource files.

Question 9: I'm a WebStar customer moving to ASIP. How do I get "default.html" files to load as the default file when requesting an HTTP directory?

Answer: AppleShare IP 6 allows you to select your default html file via the Web & File Admin application. Go to the Server menu, select Web & File Server Settings, and choose Web from the pop-up menu. You will see a button to select your Current Default Home Page File.Â

AppleShare IP 6: MacDNS And Miscellaneous FAQ

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 (Mac DNS and miscellaneous), with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. Should I set up my MacDNS server to point to itself for domain name services?
2. I want to set up an Intranet which will not have access to the Internet. Can this be done with MacDNS?
3. How do I set up an MX-record with Mac DNS?
4. Can I still use ARA MultiPort Server on my AppleShare IP file server?
5. Can I use ARA Personal Server on my AppleShare IP Server?
6. What are the port numbers used by the various AppleShare IP Services?
7. What is Multi-Homing? Does it mean I can route different network segments thru my AppleShare IP server?
8. Why do I get an error -5000 or "File or volume access denied" message?
9. PutQuestionNineHereOnThisLine
10. PutQuestionTenHereOnThisLine

Question 1: Should I set up my MacDNS server to point to itself for domain name services?

Answer: Yes. You should list the server's domain name in the Name Server Address field of the TCP/IP control panel. You can also include a second DNS server, such as your ISP's.

Question 2: I want to set up an Intranet which will not have access to the Internet. Can this be done with MacDNS?

Answer: Yes. Please see the MacDNS Frequently Asked Questions (FAQ) for details. Also refer to the "MacDNS Admin Guide," which is included with the AppleShare IP install.

Question 3: How do I set up an MX-record with MacDNS?

Answer: There are instructions and examples on setting up the MX-record in the "MacDNS Admin Guide" included with the AppleShare IP install. For additional information, also see MacDNS Frequently Asked Questions.

Question 4: Can I still use ARA MultiPort Server on my AppleShare IP file server?

Answer: ARA MultiPort Server 2.0 and later are not supported by AppleShare IP 6.

Question 5: Can I use ARA Personal Server on my AppleShare IP Server?

Answer: Yes. However, you must install ARA Personal Server first and then install AppleShare IP 6. AppleShare IP 5.0.2 or later will allow you to make additional changes to user's dial-in access options from AppleShare IP.

Question 6: What are the port numbers used by the various AppleShare IP Services?

Answer: Here is a table:

Service	Port
AFP over TCP	548
FTP	21
HTTP	80
POP3	110
SMTP	25
IMAP	143
IMAP Admin	626
Domain Name Server	53

Question 7: What is Multi-Homing? Does it mean I can route different network segments thru my AppleShare IP server?

Answer: Multi-homing provides the ability for one computer to be connected to up to four different and unique AppleTalk network segments. This is possible thru network ports installed in the computer via built-in ports and network expansion cards. Please note that multi-homing does not bridge or route those network segments into a LAN. The network segments will not see each other by being connected to this one computer, but clients on the unique network segments will all see the AppleShare IP 5.0 server. This multi-homing feature can only be enabled with the AppleShare IP 6 File Server.

Note: AFP over TCP services can only be available on one of the four AppleTalk Network segments.

Question 8: Why do I get an error -5000 or "File or volume access denied" message?

Answer: An application may be attempting to copy a file that's located in a write-only folder. You will have to either see if it is the application not using proper read and write procedures in its activities or the folder's access privileges need to be set to read and write.

AppleShare IP 6: AppleShare Client FAQ Part 1

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 client software, with answers to those questions. For the second part of this article, see article 88012: "**AppleShare IP 6: AppleShare Client FAQ Part 2"**

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. What are the main enhancements of AppleShare Client 3.8 from versions 3.7.2 and 3.7.4?
2. What are the requirements for AppleShare Client 3.8?
3. Which versions of the AppleShare Client and the Mac OS work well with 4 GB or greater hard drives?
4. Is Open Transport required on the Mac OS client?
5. Can I force an AppleTalk connection to an AppleShare IP server?
6. How do I connect to a server via TCP when that server does not appear in the Chooser?
7. Does the AppleShare Client v3.7 resolve the performance problem of earlier clients such as System Software v.7.5.3 Finder's asynchronous calls?
8. Is there a Windows client included with AppleShare IP 6?
9. How do I connect to a server that is running behind a firewall?
10. How do I connect from home to a server via my local dial-up ISP?

Question 1: What are the main enhancements of AppleShare Client 3.8 from versions 3.7.2 and 3.7.4?

Answer: The key changes of AppleShare Client 3.8 from 3.7.2 and 3.7.4 are:

- Much of the Login process is asynchronous. You can cancel out of the connection attempt.
- The 3.8 Client supports a new, transport independent UAM (User Authentication Method) Interface. This allows UAM plug-in modules to connect to servers using AFP over TCP/IP. You will need to contact your UAM vendor to obtain a new UAM that conforms to this interface.The old UAMs will still work.
- Aliases made of servers mounted via AppleTalk will not try to switch to TCP/IP. If you want a TCP/IP alias, you must first mount the server volume via TCP/IP.
- Works correctly with the AutoRemounter 1.3 control panel.

Question 2: What are the requirements for AppleShare Client 3.8?

Answer: AppleShare Client 3.8 requires Mac OS 7.6 or later and Open Transport 1.1.2 or later. In order for AutoRemounter functionality to work properly, AppleShare Client 3.8 requires AutoRemounter Control Panel version 1.3, which is included with Mac OS 8.1.

Question 3: Which versions of the AppleShare Client and the Mac OS work well with 4 GB or greater hard drives?

Answer: Refer to Article 15460 "**AppleShare File Sharing: Chart Of All Limitations**" for further information.

Question 4: Is Open Transport required on the Mac OS client?

Answer:

Question 5: Can I force an AppleTalk connection to an AppleShare IP server?

Answer: Yes, if you use Client v3.7 or later then Open Transport 1.1.2 or later is required. The pre-3.7 Client does not require Open Transport, but you will only have a regular AppleTalk connection, and you won't see the increased performance that TCP/IP connections can provide.

Question 6: How do I connect to a server via TCP when that server does not appear in the Chooser?

Answer: When you want to use TCP to connect to an AppleShare IP file server that does not appear in the "Select a file server" list in the Chooser window, click the "Server IP Address" button. When you click that button, a dialog box appears in which you can type the DNS name or the IP address of the AppleShare IP file server.

Question 7: Does the AppleShare Client v3.7 resolve the performance problem of earlier clients such as System Software v.7.5.3 Finder's asynchronous calls?

Answer: Yes. The Read Me file for AppleShare Client v3.7 details all such software improvements.

Question 8: Is there a Windows client included with AppleShare IP 6?

Answer: No. AppleShare IP 6 has built-in SMB over TCP/IP support for Windows 95/98 clients. No additional client software from Apple needs to be installed. Set up your AppleShare IP Web & File Server for SMB support in the Web & File Server Admin. Additional information is in the Help manual.

Question 9: How do I connect to a server that is running behind a firewall?

Answer: If an AppleShare IP server is running on a computer behind a firewall, you can reach it by appending a colon (:) and the TCP port number (by default, 548) to the IP address or DNS name. For example, when you go to the Chooser, select the AppleShare icon, and click on the Server IP Address button. In the dialog, type in:

```
myasipserver.com:548
```

Question 10: How do I connect from home to a server via my local dial-up ISP?

Answer: AppleShare Client includes the "Server IP Address" button in the Chooser window. This allows you to connect to an AppleShare IP server from your home via your local dial-up ISP. You can access the AppleShare IP server by typing in its IP Address in the dialog box that is displayed when you click the "Server IP Address" button.

iMac: "Disk Locked" Message When Installing FaxSTF

This article describes why a disk is locked error is generated when installing FaxSTF software after starting up from the Software Installation CD.
This article has been archived and is no longer updated by Apple.
The disk is locked error message appears because you started your computer from CD. While a majority of the FaxSTF files are installed to the folder you specify on the computer's hard disk, some of the files must be installed into the active system folder. When you start up from the CD, the active system folder is on the CD which is considered locked, so the installation fails.

To install the software, restart your computer from the hard drive then launch the FaxSTF installer.

USB: Third Party Keyboards May Not Have Command, Option Keys

Third Party USB keyboards may not always have similar configurations or key icons as Apple keyboards. In particular, they may not have a Command key or an Option key. This article lists the equivalent keys on a PC-style keyboard.

This article has been archived and is no longer updated by Apple.

Third party USB keyboards not specifically designed for the Mac OS may not have a "command" key on the keyboard. Not all third party keyboards use Apple standard icons. The following table lists keyboard equivalent for Microsoft Windows icons.

Keyboard Equivalents	
Mac OS	**Windows**
Command key	Windows key (icon on keycap looks like Windows logo)
Option key	Alt key

Finally, some keyboards may have a key which looks like a cursor pulling down a menu. This key has no equivalent in the Mac OS. It will generate a "*" character when pressed.

AppleShare IP 6: File Service FAQ

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 File Service, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. Will the fastest network connection be selected between the client and AppleShare IP Server? Or will it always try TCP/IP when both TCP/IP and AppleTalk are available?
2. How does the AppleShare client know how to connect to the Server using TCP/IP?
3. Does AppleShare IP now support sharing volumes larger than 4GB?
4. Can I change the AppleShare Server's port?
5. Will my Windows clients be able to use AFP (Apple File Protocol) over TCP/IP as well?
6. Will my Windows SMB clients be able to use AppleTalk to access the AppleShare IP 6 server?
7. AppleShare IP 6 now provides support for SMB clients. Can I install PC software from the AppleShare IP server?
8. Can I access the AppleShare IP 6 server over multiple SMB subnets?
9. Why can't I see the files on the AppleShare IP server from my Win95/98 client?
10. Can Windows clients change their User password?
11. What is the Network Trash Folder?

Question 1: Will the fastest network connection be selected between the client and AppleShare IP Server? Or will it always try TCP/IP when both TCP/IP and AppleTalk are available?

Answer: The AppleShare IP file server will default to an AFP over TCP/IP connection unless it is unavailable. AFP over TCP/IP is considered the fastest connection. The client can force an AppleTalk connection as mentioned in the AppleShare 3.7 Client FAQ.

Question 2: How does the AppleShare client know how to connect to the Server using TCP/IP?

Answer: The AppleShare IP Server sends its IP address to the client in an AppleTalk packet when it's selected in the client's Chooser. The AppleShare Client then knows to select the TCP/IP protocol for connection.

Question 3: Does AppleShare IP now support sharing volumes larger than 4GB?

Answer: Yes. When used in conjunction with AppleShare Client v3.7 for the Macintosh client, server volume sizes are read correctly up to 4GB. If the volume is actually larger than 4GB, the volume size information shown will reflect the remaining available disk space up to 4GB. Note that this is a limitation of the MacOS system software and not AppleShare IP.

For example, if the volume is 9GB and 5.5GB of disk space is used--the Macintosh client will see 3.5GB as available. In turn, if the volume is 10GB and 5.5GB of disk space is used--the Macintosh client will only see 4GB as available, because server volume sizes are read correctly up to 4GB.

Question 4: Can I change the AppleShare Server's port?

Answer: The AppleShare Client looks for the AppleTalk over TCP/IP port number to be 548. The AppleShare Client won't be able to connect to the server if this is changed. There are two ways you can connect to an AppleShare Server whose PORT resource has been changed.

- Use the Chooser's "Server IP Address..." button to manually specify the IP address of the Server, followed by a colon and the new port number.
  For example: `www.yourdomain.com:xxxx`
- Change the default AppleShare port number from the Macintosh client by using a resource editor (such as ResEdit*) to alter the 'DATB' resource (ID=1407) to match that of the server's new AFP port number.

Note: The client won't be able to connect to another AppleShare IP 6 Server whose port number has not been altered, unless you manually connect via Chooser's "Server IP Address..." button and explicitly specify the port number after the "colon" notation.

Question 5: Will my Windows clients be able to use AFP (Apple File Protocol) over TCP/IP as well?

Answer: Cooperative Printing Solutions (makers of COPSTalk) and Miramar have announced product updates that will include support for AFP over TCP. Please contact these vendors for more information.

For AppleShare IP 6, set up Window File Sharing (SMB) in the Web & File Server Admin.

Question 6: Will my Windows SMB clients be able to use AppleTalk to access the AppleShare IP 6 server?

Answer: No.

Question 7: AppleShare IP 6 now provides support for SMB clients. Can I install PC software from the AppleShare IP server?

Answer: Yes, but please note the following conditional requirements:

- Hybrid Mac/PC CDs can be shared, but not all PC files will be visible. Network installs of PC software on a hybrid CD may not work.
- A PC application installer partitioned on multiple floppy disks needs to be copied and collected in one folder. Each floppy disk's content has to be in its own sub-folder inside the main folder. Share the main folder and notify clients to install the software in this manner.
- An alert may come while installing a Windows application from AppleShare IP server. It is "Can not find <drive>:\\<installer filename>. Window needs this file to run." If the name of the folder containing the installer program is more than 8 characters in length (i.e. APPLICATION INSTALLER), change it to one containing 8 characters or less (such as INSTALL).
- Some installer programs may also require that you spell out the drive and directory path to the folder. Please consult your application's installation instructions for information on how map a drive.

Question 8: Can I access the AppleShare IP 6 server over multiple SMB subnets?

Answer: A Windows NT server has to be set up to provide this multiple subnet access.

Question 9: Why can't I see the files on the AppleShare IP server from my Win95/98 client?

Answer: Windows clients should Refresh from the View menu any server folder window whose access privileges have changed since their last login into the AppleShare IP server.

Question 10: Can Windows clients change their User password?

Answer: No. The Windows client may not receive the dialog box asking the password to be changed. Do not check the box "Require new password on next log" for a new SMB User in the Web & File Server Admin.

Question 11: What is the Network Trash Folder?

Answer: The network trash folder serves the same purpose as the invisible Trash Folder at the root of a local volume. The client Finder uses it when a user puts something into the trash from a shared volume. You will have one network trash folder at the root of every sharepoint. Within that folder will be a file called Trash Can Usage Map which is used by the Finder on the client computer to claim a Trash Can #x folder to use as the trash can for the server volume.

When a client throws away a file on a remote volume the Finder tries to get a lock on the first byte of the Trash Can Usage Map. If that byte is locked, it tries to get a lock on the second byte and so on. When it gets the lock it "claims" the corresponding Trash Can folder. It then moves the file to be thrown away into its Trash Can folder. When the User selects Empty Trash, the Finder will empty its Trash Can Folder. If the client computer breaks the connection via crashing or being disconnected, the Trash Can folder will not be emptied. However when a client Finder claims a Trash Can folder, it will delete anything that was in the folder previously.

Warning: The instructions in this article refer to using ResEdit to alter your system software. Apple, Inc., is not liable for any damage done to your software through the use of ResEdit to alter the software.

AppleShare IP 6: Mail Service FAQ Part 1

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 Mail Service, with answers to those questions. For the second part of this article, see article 88008: "AppleShare IP 6: Mail Service FAQ Part 2"
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What are the differences between SMTP, POP, and IMAP?
2. Why are there so many different options for user mail inboxes?
3. How do I increase the number of concurrent connections for POP & IMAP?
4. What is the purpose of the Internet Alias for a user?
5. Why would I want to make a Finger request to the AppleShare IP 6 Mail Server?
6. Is there an easy way to send mail to a list of users on the mail server?
7. How do I setup and use the NotifyMail(TM) feature?
8. What is the IMAP Admin port?
9. Can mail clients have accounts on the Mail Server if the available network only supports AppleTalk?
10. Can the Mail Server support TCP/IP and AppleTalk clients simultaneously?
11. How can I adjust the number of hours the Mail Server will attempt to deliver mail before returning it to the sender?

Question 1: What are the differences between SMTP, POP, and IMAP?

Answer: SMTP (Simple Mail Transfer Protocol) is used to transfer mail from client applications to a mail server, or to transfer messages from one mail server to another. It is used only for email message uploads. POP (Post Office Protocol) is used to download email from a mail server to a client. Once the mail message has been received by the email client the message is then deleted off of the server. The mail is then stored only on the client machine. IMAP (Internet Message Access Protocol) is a new mail protocol used in AppleShare IP 6. IMAP (the latest version is IMAP4) is a standard client-server protocol in which email is received and held for you by your mail server. Since all the mail is stored on the server it is accessible from anywhere you have an IMAP client, you can be at home or work and still view all your email. Another advantage is the ability to view only the parts of an email that interest you, you don't have to download the entire message in order to read it. For instance you can read the sender, subject, and text body of a message before you download the 40MB attachment that is included with the message. You can also create and manipulate mailboxes on the server as well as delete messages, or search for certain parts of a message.

Question 2: Why are there so many different options for user mail inboxes?

Answer: The typical email user will log in via POP or IMAP exclusively. For these users it is best to enable POP only or IMAP only since these settings only need one inbox as a location for new mail. With a user setting of "Both POP and IMAP", there are lots of choices for how the users inbox will be handled. There can be a shared inbox, which means that (1) all new mail goes into one inbox, and (2) when the user logs in via either protocol they view the same inbox. This setup can result in issues if the user has a POP client that routinely checks mail. When the POP client downloads and deletes the mail from the shared inbox it will become unavailable to the IMAP client and will seem to disappear from the IMAP clients' inbox. This issue can be solved by using separate inboxes for POP and IMAP. Separate inboxes mean that all new mail is placed in two mailboxes "INBOX" for IMAP & "POP3 INBOX" for POP. This way the different email clients do not conflict with each other when accessing the same users mail. An additional option for this type of setup is to make the "POP3 INBOX" visible to the IMAP client in the IMAP folder list. This can be useful for clearing out email that builds up in the "POP3 INBOX" if the POP client does not check the account regularly.

Question 3: How do I increase the number of concurrent connections for POP & IMAP?

Answer: Increase the amount of memory allocated to the AppleShare IP Mail Server application located in the System Folder's Extensions folder. Do a "Get Info" on the file and change the "Preferred Memory Size" to a larger value. Giving the server more memory allows for more users to be connected to the server at one time. It also increases the overall performance of the server. The default memory size allows only 18 users. A memory allocation of 15 MB for the mail server will allow 94 simultaneous users and 35 MB will allow for 250. Give the mail server as much memory as possible for the best performance.

Question 4: What is the purpose of the Internet Alias for a user?

Answer: The Internet Alias is only needed when the user name contains spaces or other characters that are not valid on the internet. For example, the user name "Robert Smith" would need an internet alias of "rsmith" in order to receive email or log into the file server via FTP. If the user name is valid for the internet there is no need for an Internet Alias, such as "alice.jones".

Question 5: Why would I want to make a Finger request to the AppleShare IP 6 Mail Server?

Answer: Finger is an internet protocol for making user account information requests. You may wish to do this in order to see user account status such as number of unread messages, last login time, or simply to verify that the user account exists. You can also get host information such as last connect time or number of queued messages.

Question 6: Is there an easy way to send mail to a list of users on the mail server?

Answer: Yes. Create a group that has an internet savvy name and assign users to this group. When you send email to the group, all members of the group will receive a copy of the message. You can also add users to the group that have autoforward setup to send the message to users that

are not in the local Users & Groups file.

Question 7: How do I setup and use the NotifyMail(TM) feature?

Answer: The ASIP 6 Mail Server now supports mail notification in conjunction with the NotifyMail(TM) software (available at **http://www.notifymail.com**). This feature is usually only used with POP clients to notify them when new mail has arrived. First you need to install and configure the NotifyMail(TM) software on all your client computers. Then go into the mail settings panel for each user and turn on "Enable NotifyMail(TM)" using either of the IP notification settings. Lastly turn on the NotifyMail(TM) protocol in the Advanced Mail Settings, Network panel of the Mail Admin.

Question 8: What is the IMAP Admin port?

Answer: It is a special port number (626) that can be used with any IMAP client that supports changing of the IMAP port and supports nested folders. Admin port users must have the "enable user to administer server" checkbox set in order to log in. This port allows the administrator to view all the mail on the server, including user accounts, disabled user accounts, and outgoing mail for hosts. Administrators can view, move, delete, search, or perform any IMAP command to any message on the server.

Question 9: Can mail clients have accounts on the Mail Server if the available network only supports AppleTalk?

Answer: Yes, using Claris Emailer's Officemail account will allow users to log into the server via AppleTalk to check their mail via POP only.

Question 10: Can the Mail Server support TCP/IP and AppleTalk clients simultaneously?

Answer: Yes. However, TCP/IP is the preferred method because it is faster and there are more clients to choose from that support it.

Question 11: How can I adjust the number of hours the Mail Server will attempt to deliver mail before returning it to the sender?

Answer: Open the Mail Admin program. Choose the Mail Server Settings, Mail Out panel and type a new number in the Message Expiration field. Click Save. By default this value is set to 72 hours.

AppleShare IP 6: FTP Service FAQ

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 FTP Service, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. How are 'put' files stored on the server?
2. Are files uploaded to the FTP Server automatically binhexed?
3. Are they also compressed?
4. Are files downloaded from the FTP Server automatically decoded?
5. How do I FTP from Netscape Navigator or Internet Explorer if a name and password are required?
6. When I log on to an AppleShare IP 6 Server via AppleTalk and the Chooser, I can 'upload' files in a drop folder. However, when I log on via FTP, the FTP application says "Access Denied" when 'putting' files in the same drop folder.
7. Why can't I 'put' files in a folder with "Drop Box" permissions?
8. Does the FTP server resolve aliases that reside on it?
9. Why can't I use "mget" to get a list of files?
10. Can I do 'get' or 'put' to ASIP FTP server from BBEdit?
11. Is it normal to see folders listed that I do not have read- and/or write-access to?
12. Can I share graphic files with a PC/Windows client using FTP?

Question 1: How are 'put' files stored on the server?

Answer: Files are stored in their original format. You do not need to convert files to MacBinary or BinHex before uploading to the FTP server. The FTP server will do this automatically.

Question 2: Are files uploaded to the FTP Server automatically binhexed?

Answer: The encoding of a file in any format is specific to the client used. The most common formats are MacBinary and Binhex. Many Macintosh FTP clients will automatically encode the file before posting it to the server in the format selected by their preference setting.

When a file is received by the AppleShare IP server, it will automatically decode any file in the MacBinary or Binhex format.

Question 3: Are they also compressed?

Answer: The compression of a file is entirely dependent on the FTP client being used. Some Macintosh FTP clients have the ability to compress a file before sending it to the server, if that function is enabled by their preference setting.

The AppleShare IP FTP is **not** capable of decompressing files.

Question 4: Are files downloaded from the FTP Server automatically decoded?

Answer: Not all transmitted files are encoded, so sometimes decoding is not necessary. If decoding is necessary, most of the FTP clients for the Macintosh are capable of decoding automatically. The behavior in this matter is entirely dependent on the FTP client.

Here are the rules the FTP server uses to determine what type of encoding is necessary:

If the transfer mode is "text" (ASCII) and the target file is a text file, then it is encoded in the text format. If the transfer mode is "text" (ASCII) and the target file is **not** a text file, then it is encoded in the Binhex format. If the transfer mode is "binary" (Image), then just the data fork of the file is transferred with **no** encoding. If the transfer mode is "binary" (Image) and a "MACB E" command has been issued, then the file is encoded in MacBinary format.

Fetch (3.0.2 and greater) has been modified to be AppleShare IP friendly. It will automatically take care of all encoding/decoding needs if left in the "Automatic" mode.

Question 5: How do I FTP from Netscape Navigator or Internet Explorer if a name and password are required?

Answer: Use this URL format: ftp://username:password@ftp.site.com/

Question 6: When I log on to an AppleShare IP 6 Server via AppleTalk and the Chooser, I can 'upload' files in a drop folder. However, when I log on via FTP, the FTP application says "Access Denied" when 'putting' files in the same drop folder.

Answer: In order to use a common AppleShare IP dropbox, the FTP client needs to have the "store unique" option available. Currently, Fetch does not support this feature. Most Unix clients will support this "store unique" option. Macintosh FTP clients may or may not support the "store unique" option.

Store Unique supported:

- Vicom FTP Client 2.8.1 (under Preferences: Default Server Settings: Files, choose "Make Unique Files").

Store Unique unsupported:

- Fetch 3.0.3
- Anarchie Pro 3.5
- NetFinder 2.0

If you choose to use a Unix-compatible FTP client to upload files, you must be sure to have the "store unique" feature toggled on. Otherwise, you'll get the same "Access Denied" message. To toggle "store unique" on most clients, simply type "sunique" at the ftp prompt. For further information, refer to the online documentation included with your particular Unix-based distribution.

Question 7: Why can't I 'put' files in a folder with "Drop Box" permissions?

Answer: In order to maintain security and a consistent user experience across all services, the FTP client must use the "Store Unique" option in order to put files in a "Drop Box" folder. While most Mac clients currently do **not** support this feature, many Unix FTP clients do, as does NCSA Telnet when used as an FTP client.

Question 8: Does the FTP server resolve aliases that reside on it?

Answer: AppleShare IP 5.0 does not resolve aliases to ensure server security. AppleShare IP 6 does resolve aliases. User privileges may have to be set to allow access to folders where the application or file is located.

Question 9: Why can't I use "mget" to get a list of files?

Answer: You can use the "mget" command on some FTP clients to retrieve a list of files rather than one at a time. However, the list must consist of full filenames. Wildcarding filenames (e.g. *.jpg) are not supported in this release of the FTP server.

Question 10: Can I do 'get' or 'put' to ASIP FTP server from BBEdit?

Answer: Yes.

Question 11: Is it normal to see folders listed that I do not have read- and/or write-access to?

Answer: Yes. This is standard policy for all types of ftp servers.

Question 12: Can I share graphic files with a PC/Windows client using FTP?

Answer: The AppleShare IP FTP server will place files in a shared folder, with a suffix of .bin is attached to the name. In other words, if I have a file called graphic1 and place it in a shared folder called graphicFiles, when viewed from an FTP client program, the files shows up as graphic1.bin. This is not a problem for the Mac clients but it turns out to be a problem for the PC/Windows clients. When the PC/Windows clients access the file and downloads it, the file is unreadable. However, if on a Mac client, I FTP the file using Fetch or ICQ directly to the PC/Windows clients computer, the problem with reading the file disappears.

The logic is as follows:

If a file contains a resource fork, it is automatically served up as a MacBinary file regardless of its file extension. It was necessary for us to implement this behavior in order to get the Netscape browsers to download files properly via FTP.

In the "AppleShare Web & File" extension, there is a 'pref' resource that can be changed to prevent the the above behavior. In the meantime, resource editor savvy users (with a resource editor such as ResEdit*) can change the value of the 'pref' resource ID 1755 from "0001" to "0000" to disable auto MacBinary encoding.

*** Warning:** The instructions in this article refer to using ResEdit to alter your system software. Apple, Inc., is not liable for any damage done to your software through the use of ResEdit to alter the software.

AppleShare IP 6.0: General FAQ

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6.0 in general, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. What is AppleShare IP 6.0?
2. Do I have to upgrade to AppleShare IP 6.0?
3. What does the AppleShare IP 6.0 license agreement mean?
4. Can I install AppleShare IP 6.0 on a MacOS clone computer?
5. Can I install AppleShare IP 6.0 on a Macintosh 603 PowerPC computer?
6. When I want to change my Open Transport control panel settings, the server will hang.Why is that?
7. Is there a hard-coded limitation in Web & File Admin (or the Registry?) which limits a UG file to having a maximum of 10,000 users?
8. Is this more of a practical limitation by not recommending people to have more than 4000 users since it slows down Web & File Admin's screen updates, and so forth?
9. On my AppleShare Web & File Server computer, if I restart using another disk with a different system folder with Personal File Sharing Enabled, I lose all my sharepoints and access information. Why?
10. Importing a Users & Groups list sometimes brings up a prompt to select an application that can read the file. What do I do?
11. What does the high performance mode available in AppleShare IP 6.0 do for me?
12. Can I use the high performance mode for AppleTalk clients?
13. I saw the AppleShare MMgr Init on the AppleShare IP 6.0 CD. Can I install it on my AppleShare IP 5.0 server as well?
14. Can I have Virtual Memory turned ON on my AppleShare IP server?

Question 1: What is AppleShare IP 6.0?

Answer: AppleShare IP 6.0 is a complete set of LAN and Internet services--including everything you need to set up Web, File, Mail, and Print servers, as well as FTP. New for version 6, AppleShare IP now provides built-in support for Windows file sharing and the AppleShare IP Mail Server now supports the Internet standard IMAPv4 protocol. Support for these open standards means that AppleShare IP is fully compatible with Macintosh and Windows clients. A single administration console makes it simple to manage AppleShare users, groups, passwords and security, retaining the hallmark ease of use which makes AppleShare IP the easiest server operating system available.

AppleShare IP 6.0 provides support for any Apple Power Macintosh computer or Macintosh Server with a PowerPC(TM) G3, 604e, 604, 603e 6500 series, or 601 microprocessor. It is compatible with Mac OS 8.1.

Question 2: Do I have to upgrade to AppleShare IP 6.0?

Answer: No. Earlier versions of AppleShare can continue to be used, but AppleShare IP 6.0 brings performance enhancements, improved scalability and many new features such as native support for Windows clients. We expect most customers running AppleShare 4.x and AppleShare IP 5.0 will be interested in upgrading to acquire the new accessibility offered by AppleShare IP 6.0.

Question 3: What does the AppleShare IP 6.0 license agreement mean?

Answer: The license specifies the terms and conditions under which the AppleShare IP 6.0 software may be used. The license agreement allows the customer to split the software into three pieces and install them on separate systems. Ideally, for the best performance, the File/Web, Mail, and Print services should be installed on separate systems. The license does not allow multiple copies of a single server to be installed on multiple computers.

The number of computers that may interact with the Server Software is specified by the Serial Number Card packaged with the Apple Software.

Note: The actual number of simultaneous connections is dependent upon system software, hardware, and server usage.

Question 4: Can I install AppleShare IP 6.0 on a MacOS clone computer?

Answer: No. AppleShare IP 6.0 was not tested for compatibility with Mac OS clone computers. If you were to install AppleShare IP 6.0 on a Mac OS clone and problems were to occur, contact the clone manufacturer for support.

Question 5: Can I install AppleShare IP 6.0 on a Macintosh 603 PowerPC computer?

Answer: You can install AppleShare IP 6.0 on a 603e 6500 series computer.

Question 6: When I want to change my Open Transport control panel settings, the server will hang.Why is that?

Answer: As noted in the AppleShare IP 6.0 documentation, OpenTransport settings should not be changed while any of the AppleShare IP services are running. It will result in a server hang condition and you will have to restart your server hardware. In order to change you your networking configuration in OpenTransport, quit all of the AppleShare IP services, make the necessary changes to OpenTransport, and restart your AppleShare IP services.

Question 7: Is there a hard-coded limitation in Web & File Admin (or the Registry?) which limits a UG file to having a maximum of 10,000 users?

Answer: No. However, having a large amount of Users may cause the Admin application to run out of memory.

Question 8: Is this more of a practical limitation by not recommending people to have more than 4000 users since it slows down Web & File Admin's screen updates, and so forth?

Answer: Yes, this is correct. It is a practical limitation. In fact, people can exceed 4096 but performance could degrade above this number. You can exceed 4096 users but you may suffer from performance issues at larger numbers.

Question 9: On my AppleShare Web & File Server computer, if I restart using another disk with a different system folder with Personal File Sharing Enabled, I lose all my sharepoints and access information. Why?

Answer: Personal File Sharing and AppleShare use different formats for the AppleShare pdf file that stores privileges, so one will overwrite the other. To avoid having to recreate sharing information, do not start up your server using a disk that has Personal File Sharing Enabled, and do not enable Personal File Sharing after starting your server from any disk.

Question 10: Importing a Users & Groups list sometimes brings up a prompt to select an application that can read the file. What do I do?

Answer: A file type translator program on your computer may bring up this prompt. If this occurs, select Open Doc as application that can read the file.

Question 11: What does the high performance mode available in AppleShare IP 6.0 do for me?

Answer: AppleShare IP 6.0 Web & File Server, upon first launch, checks how much random access memory (RAM) is available. If there is 12 MB of RAM available, the Web & File Server will start in this high performance mode. This mode works for AFP over IP and TCP/IP client access. It will take an additional 3MB of RAM to run in this mode. Benefits provided are: greater performance, scalability through an increased number of internal buffers, larger buffer sizes, a maximum concurrent limit for file services of 500, and a maximum concurrent limit for web server requests of 150.

It is highly recommended that customers utilizing this feature have AppleShare IP 6.0 running on a Power Macintosh G3 computer with minimum of 128MB RAM.

Question 12: Can I use the high performance mode for AppleTalk clients?

Answer: No. Maximum number of clients that can connect via AppleTalk is still set at 250. The rest of the clients have to connect via TCP/IP to reach the 500 limit.

Question 13: I saw the AppleShare MMgr Init on the AppleShare IP 6.0 CD. Can I install it on my AppleShare IP 5.0 server as well?

Answer: The AppleShare MMgr Init can be installed in the System folders of AppleShare IP 5.0.3 and 6.0 servers. The Init will install but not load if you are running a previous of AppleShare IP 5.0.x. The Init fixes a condition where the AppleShare IP server may stop responding. This Init is also available on the Apple Support web site's Apple Software Updates section.

Question 14: Can I have Virtual Memory turned ON on my AppleShare IP server?

Answer: Yes. It is only recommended for AppleShare IP servers that have 32MB RAM, are running a light load of connected and active clients. Install additional memory if the server load gets heavier. A server with 64MB RAM or greater should not need Virtual Memory turned ON.

AppleShare IP 6 Admin: FAQ

This article contains frequently asked questions (FAQ) regarding AppleShare IP 6 Admin, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. What can I do if I forget my AppleShare IP 6 Admin password?
2. Are volume access privileges still stored in the AppleShare PDS file?
3. Is the Users & Groups Data File shared by all of the AppleShare IP 6 Services?
4. What information is stored in the AppleShare IP 6 preference files?
5. Is the "copy volume" command still available?
6. Can I still compact access privileges?
7. What AppleShare IP Services can I move to different servers?
8. What is the Users & Groups Data File backup file?
9. Where is the serial number stored?
10. Can I move my Users & Groups data file to a new System folder after I do a clean install or when I want to move the Server to a different computer?
11. How can I delete an entire group of users, for example the Class of '98 group and all of its users?
12. Is the Users and Groups Manager Lite compatible with AppleShare IP 6?

Question 1: What can I do if I forget my AppleShare IP 6 Admin password?

Answer: Please see the following article for complete details:

Article 8662: "**AppleShare Admin: What To Do If You Lose The Password**"

Question 2: Are volume access privileges still stored in the AppleShare PDS file?

Answer: Yes. Each volume still contains an invisible AppleShare PDS file at the root level of its directory. You will need to make it visible with a utility such as Norton Disk Editor or ResEdit in order to trash it. This is normally done when the privileges are unusable and privilege changes cannot be made to a folder or volume.

Question 3: Is the Users & Groups Data File shared by all of the AppleShare IP 6 Services?

Answer: The Data File is shared by all AppleShare IP 6 Services and is stored in the Users and Groups Data File. It is best to keep those Services on one server. If separated, do a Custom Install of each service so that Web & File Server Admin is installed. This is installed for access to the Users & Groups list. Please refer to the Mail Server Help manual for steps to separate the Mail Server to its own server hardware.

Question 4: What information is stored in the AppleShare IP 6 preference files?

Answer: There are 8 separate sections to the answer:

General AppleShare IP Information

Version number for this record, version number for file server, user activity limit expressed as a percentage, maximum client connections, maximum number of guest and anonymous logins, minutes until shutdown, number of serial numbers in struct, serial number, name and phone, organization.

AppleShare IP File Server Information
Login greeting, memory to be reserved for other applications, maimumx number of minutes for idle users, disconnect message, AFP over TCP/IP enabled, AFP over AppleTalk enabled.

AppleShare IP Web Server Information
Web server enabled, web Log enabled, web server maximum client connections, whether guests are allowed for web server, HTML folder path vRefNum, HTML folder path volume name, HTML folder path volume creation date, HTML folder path DirID, partial path to HTML file starting from the Web folder, IP Filters.

AppleShare IP Windows File Sharing Information
Windows File Server name, Windows Workgroup Name, WINS Server name (if applicable).

FTP Information
FTP server enabled, FTP Anonymous login enabled.

AppleShare IP 6 Print Server Attributes
Starting up, running, shutting down, autolaunch print server.

AppleShare IP 6 Mail Server General Information
Minimum Free Space for Mail File, Maximum Server Log File Size, Maximum Error Log File Size, Message for Delivery Expiration Hours, Maximum Message Size, Mail Store Volume Name, Bounce Server Name, Bounce Zone Name, Bounce DNS. Name

AppleShare IP 6 Mail Server Attributes in each user record
AppleTalk Forward Name, AppleTalk Forward Server, AppleTalk Forward Zone, SMTP Forward, Fingerprint Length, MU Attributes.

Question 5: Is the "copy volume" command still available?

Answer: Yes. It is now the "Duplicate Folder" command.

Question 6: Can I still compact access privileges?

Answer: No. It is not necessary.

Question 7: What AppleShare IP Services can I move to different servers?

Answer: All AppleShare IP services have to be installed on Apple Power Macintosh computers. Mail and Print services can be installed on separate servers. Make sure you copy the Web & File Admin application to these servers so the Users & Groups Data File can be accessed. A Custom Install of these servers will, by default, install Web & File Admin application.

In addition, all services use the same Users & Groups Data File. You will have to copy the Users & Groups Data File to each server's System Folder Preference folder.

Question 8: What is the Users & Groups Data File backup file?

Answer: This file is created the first time you install AppleShare IP 6. It is intended as a backup of the current Users & Group Data File in case you want to go back to earlier versions of AppleShare server software. It does not get updated after AppleShare IP 6 is installed.

Question 9: Where is the serial number stored?

Answer: This is stored in the Users & Groups Data File if Easy Setup was selected.

Question 10: Can I move my Users & Groups data file to a new System folder after I do a clean install or when I want to move the Server to a different computer?

Answer: Yes, see the AppleShare IP 6 Help online manual section--Changing the Startup Disk.

Question 11: How can I delete an entire group of users, for example the Class of '98 group and all of its users?

Answer: There is no easy way to do this. The group can be eliminated simply enough but the flexibility of users belonging potentially to different groups makes it difficult to do batch user deletions. There are some workarounds described in the AppleShare IP 6 online Help.

Question 12: Is the Users and Groups Manager Lite compatible with AppleShare IP 6?

Answer: No.

Published Date: Feb 20, 2012

AppleShare IP 6.0: What‘s New

This article describes what's new in AppleShare IP 6.0.
This article has been archived and is no longer updated by Apple.
AppleShare IP 6.0 is a follow-on release to AppleShare 5.0. In addition to issue fixes and performance improvements over ASIP 5.x, version 6.0 provides many new features for administrators and client, listed below by major component:

General

Support for more Macintosh Systems: ASIP is works on any Apple Power Macintosh or Workgroup Server with a G3, 604, 604e, or 601 microprocessor. The Power Macintosh 6500 (603e microprocessor) has also been tested and qualified as an ASIP server.

Issue fixes.

Online update to manual:

ASIP 6.0 includes on line help files in html format (opens in Microsoft Internet Explorer), to assist in setting up and configuring the server.

File Services

Dynamic RAM Allocation:

On Macintosh Server G3 computers with 128 MB of RAM or more, the maximum number of concurrent clients is increased from 250 to 500, when a sufficient amount of memory (12MB) is free when the Web & File Server launches.

Idle Disconnect:

This feature allows the administrator to set a time after which idle connections will be terminated. Separate settings can be configured for guests and registered users, and clients with open files can be exempted.

Separate web guest privileges:

You can now allow guest access to your Web pages, while restricting guest access to file services.

Performance improvements:

Improved data caching and overall system optimization.

SMB Services:

The Windows file sharing protocol is "Server Message Block" (SMB), used for file sharing in Microsoft's LAN Manager, Windows for Workgroups, Windows 95, and Windows NT.

SMB runs on top of a protocol called NetBIOS, which can run on top of several other protocols such as NetBEUI, Novell IPX, and TCP/IP.

AppleShare IP only supports SMB via TCP/IP.

FTP Services

Alias Resolution:

FTP clients can now open aliases on the server's local volumes (requires sufficient access privileges to the original).

Separate FTP guest privileges:

Anonymous FTP can be enabled, separately from guest access to other file services.

ISO Character Support:

Improves interoperability with Windows clients, that in the past had problems due to differences in character sets. Version 6.0 maps names to ISO characters sets.

Web Services

W*API 1.2 support:

Maintains compatibility with third-party plug-ins.

User Editable Error files:

User-created error.html and noaccess.html files, if present in the Web Folder, will override ASIP's default error messages.

Alias Resolution:

Web clients can resolve aliases to other folders on the server's local volumes (requires appropriate access privileges).

HTTP 1.1 support:

The Web Server now supports HTTP 1.1, including persistent connections, byte-range requests, and file upload.

Separate web guest privileges:

Guest access to the Web server can be enabled, independent of other services.

Enhanced security options:

Administrators can enable/disable directory listing and turn on copy protection.

Mail Services

IMAP Support:

New to version 6.0 is support for IMAP, enabling mail clients to retain their messages and folders on the server.

Integration of V-Twin:

The mail server uses Apple's V-Twin technology to search mail server database. (There is no human interface component with this feature).

Domain/address access control:

The administrator can allow or reject mail on a host-by-host basis. An anti-spamming feature allows the administrator to verify that mail purported to be from the ASIP mail server user is actually from a valid user who has mail service enabled.

Print Services

LPR Support:

Print queues can support AppleTalk (via PAP, Printer Access Protocol), TCP/IP (via LPR, Line Printer Remote) or both. Printers can be attached via PAP or LPR.

Extensible by third-parties for accounting.

User Authentication:

Administrators can create print queues that will accept print jobs only from designated users or groups.

AppleShare Client 3.8

Asynchronous Login:

The main dialogs will be moveable modal, and a status dialog box will enable the user to cancel lookups and pending connections.

Published Date: Feb 20, 2012

AppleShare IP 6: Troubleshooting Installation Problems

This article offers troubleshooting information for difficulties that may be encountered during the installation of AppleShare IP 6.
This article has been archived and is no longer updated by Apple.
If you have any issues during the installation process of AppleShare IP 6 (ASIP), here are some suggestions:

- Verify that your computer meets the minimum system requirements for ASIP. (details below)
  - CPU type
  - Version of Mac OS
  - Version of Open Transport
  - Version of OpenDoc
  - Amount of memory
- Verify that your startup disk has sufficient free space for the ASIP files.
- Run Disk First Aid on your startup disk and all server volumes before the installation.

If the disk utility finds problems it cannot repair, do the following:

1. Backup all data

2. Reformat the drive using your favorite disk driver utility (Now would be a good time to put the drive in HFS+ format, for more efficient file storage.)

3. Do a clean system install.

4. Configure your control panels as needed (Date & Time, File Sharing, AppleTalk, TCP/IP)

5. Try reinstalling ASIP again.

6. Restore other data to the disk, as needed.

- Turn off non-Mac OS extensions during the install.
- If a previous version of ASIP is installed, remove those files (or move them to a new location). The installer may have issues replacing files that are unusable.
- You may be able to use the Installer's "Custom Remove" option. Leave the Users & Groups data file and the PDS files in place in order to retain privileges and user information.

If none of the above works, you may have some unusable system files that are preventing the installation. Try the following:

1. Perform a clean system install

2. Reconfigure your control panels (Date & Time, File Sharing, AppleTalk, TCP/IP).

3. Try the install again.

Can't find ASIP Serial Number

If you purchased an ASIP upgrade kit, no serial number is included. Use the serial number from your previous version of AppleShare or ASIP.

If you cannot find the serial number card from the previous version of AppleShare, you should be able to find the serial number in the AppleShare Admin Server Settings or in the Web & File Admin program, if the server is still up and running.

If the server is not currently up and running, remember that the serial number information is stored in the Users & Groups data file. If you backed up your server's Users & Groups data file, you can restore that file to the new server, and the serial number will be restored at the same time. See the section on moving Users & Groups data file to a new server for details on how to do this.

If you purchased a full version of ASIP, the serial number will be on the CD jacket, on an adhesive sticker, which can be placed in your manual, if you wish. Be sure to keep the serial number in a safe place, but do not stick it to the CD itself (it might come off while inside the CD-ROM drive).

Moving User & Group information to another server

It's often useful to be able to carry users & groups from one server to another, for example, if you wanted to move mail services to another computer. Instead of creating all users a second time on the new mail server, you can move the data from one server to another. There are different approaches to doing this:

Move the Users & Groups data file.

All the data on users & groups are stored in the Users & Groups data file, located in the System Folder:Preferences. Moving this file from one computer to another will move ALL users & groups, and will replace any user data that is currently set up on the second computer. To move this file from Server A to Server B, follow these steps:

1. Configure Server B with Mac OS and install ASIP.
2. Verify that the "Network identity" fields in the File Sharing control panel contain the name of the server (Server names for A and B do not need to be the same).
3. Drag Server B's existing Users & Groups data file to the desktop.
4. Drag a copy of Server A's Users & groups data file to Server B's System Folder:Preferences.
5. Restart the server
6. Open Web & File Admin program to verify that Users & Groups have successfully been carried over.

Note: the Users & Groups data file also contains the serial number. If Web & File services are going to offered on both machines, be sure to change the serial number on one of them (Mail Services and Print Services don't look for the serial number). See "Duplicate Serial Numbers" for more info.

Export/Import Users & Group data

AppleShare IP allows you to export Users & Group data to a tab-delimited text file, then imported into another ASIP server.

To export data:

1. Select the Users you want to export. Shift-click to select multiple Users. Command-A will select all (but you will get a warning that 'Guest' and groups cannot be exported).
2. Select "Export Users & Groups" from the File menu of the Web & File Server Admin program. You can elect to export Internet Alias, Comments, and Email attributes. If you select Email attributes, you should also select Internet alias. The email attributes will be either "nomail", "hasmail", "forwardInternet" followed by the address. For example, user Mary Smith's exported file looks like this:
Mary Smith smith.m HasMail NoRequireAPOP BothPOPIMAPShare NoNotification

Passwords are not exported for security reasons, but they can be imported. You can open the text file with a spreadsheet or word processing program, enter default passwords for the users in the appropriate field, and then import the passwords along with the other user information.

To import data, select "Import Users & Groups" from the File menu of the Web & File Server Admin program. In addition to the name, you have the option of importing Internet Alias, Password, Comment, and Email Attributes.

If importing users with passwords, be sure to add the passwords in the appropriate field. For example, if you wanted to import internet aliases and e-mail attributes (skipping "Comments"), the password would be entered between these two fields. Using Mary Smith as an example again, her record for importing with a password "secret1", would be as follows (note that tabs would separate the fields in the text file you were importing from. Here, the tabs are indicated with a "->". Each record would be indicated with a hard return or carriage return, here indicated with a <CR>.)

Mary Smith ->smith.m -> secret1 -> HasMail->NoRequireAPOP-> BothPOPIMAP->Share->NoNotification <CR>

For AppleShare IP 6 system requirements, please see article 88015: "**AppleShare IP 6: Server and Client Requirements**"

AppleShare IP 6.0: Troubleshooting Web & File Services

This article includes tips for troubleshooting common problems with Web & File Sharing. Some of the tips included below are also in the AppleShare IP 6.0 (ASIP) Help files.
This article has been archived and is no longer updated by Apple.

General Web & File

You can't open the Web & File Admin program

- Verify that ASIP and OpenDoc extensions are installed and loaded.
- Verify sufficient memory is free to open the application.
- If password is being rejected, verify CapsLock key is not down. (See the section of forgotten passwords, if that's the problem.)
- If attempting to open the Admin program from the ASIP Manager application, try to open it by simply double-clicking on the Web & File Server Admin application from the Finder.
- Try opening other Admin programs, such as Mail Server Admin. Success opening another admin application would indicate that there are no problems with Open Doc and Users & Groups data file. Try reinstalling the Web & File Admin program itself.
- Test to see if the Users & Groups data file and PDS files are unusable. Replace the Users & Groups Data File with a recent backup copy, if available.
- You should back up your Users & Groups Data File regularly, as well as all the shared data on the server.

Not enough memory to start other programs.

- Choose Reset Cache from the Web & File Admin program's Server menu to flush the cache. Flushing the cache temporarily reduces the amount of memory used by the Web & File Server, thereby making memory available for other programs.
- If flushing the cache corrects the issue, you may not have reserved enough of your computer's random-access memory (RAM) for programs other than the Web & File Server. To do so:

    1. In the Web & File Admin program, choose Web & File Server Settings from the Server menu.

    2. Choose Cache from the pop-up menu.

    3. Increase the number in the "Reserved memory for other applications" box to allow other applications to run.
    (To see the memory requirements of each application, select its name in the Finder and choose Get Info from the Finder's File menu.)

- An alternative to resetting cache size is to start other programs before you start the Web & File Server. If you are trying to start the Mail Server, set it up to start automatically when you restart the computer. Start other programs when you restart the computer by creating an alias for them in the Startup Items folder, inside the System Folder of your computer. The Startup Items will be launched in alphabetical order. It helps to rename the aliases with numbers, indicating the order in which you want them to start up.

File Sharing takes a long time to start up

ASIP must verify the privileges for each folder against information in the Users & Groups Data file whenever file sharing starts up. A very large number of folders, each with explicit privileges, can result in this being a long process (allow at least 15 minutes). Any unusable PDS files can also cause the server to never finish starting up.

If the server eventually does start up , then try changing explicit privileges to inherited, where appropriate. See the related topic on explicit versus inherited privileges, for more details.

If the server never starts up, make sure that each volume on the desktop has sufficient disk space for a PDS file to be created. If so, one or more of the server's PDS files may be unusable. See the related topic on how privileges are stored for assistance in troubleshooting this issue.

Duplicate serial number on the network

When the Web & File Server starts up, it checks the network on which your computer resides for other computers using the same serial number as the one registered on your computer. If the same serial number is detected, an unauthorized copy of AppleShare IP software is running in violation of the Apple software licensing agreement.

Determine which computer is running software in violation of the agreement and cease using that copy of the software.

You cannot open the Users & Groups control panel

The Users & Groups control panel cannot be used once you have installed the AppleShare IP software. You use the Web & File Admin program to register users and groups instead.

If you have installed Apple Remote Access Personal Server, the instructions may tell you to go to the Users & Groups control panel to enable your clients to dial in. You'll find these dial in options have been added to your users' settings when you view them with the Web & File Admin program.

Creation and modification dates or times are incorrect

If the server's clock is incorrect:

1. Stop the Web & File Server.
2. Open the Date & Time control panel.
3. Check the time zone.
4. Reset the date and time as necessary.
5. Restart the Web & File Server.

If the computer's internal battery needs replacing, have the battery changed and then set the clock.

If the clock of a user's computer is incorrect, instruct the user to log off the Web & File Server, reset his or her computer's clock, and then log on again.

Note that the ASIP server will make adjustments for clients in a different time zone creating or modifying files on the server. When viewed at the server itself, the creation and modified dates & times will reflect the server's local time, not the time at the client's location. But when viewed from a client workstation in another time zone, the date and time will reflect the client's local time.

Administrator's Password Forgotten

Please see the following article for complete details:

Article 8662: "**AppleShare Admin: What To Do If You Lose The Password**"

Users login become disabled

Re-enable users login in the "General" setting for that user (check "User may log on")

If this is a continuing issue, check Web & File Server Settings:Password for the option to disable login after X failed attempts. If this is a relatively low number, increase it to allow for users who may be uncertain of their password.

The access privileges you assigned to all folders, or to a single folder, on a volume are lost

Access privileges can be lost if:

- The PDS file is corrupted.
- A shared folder was moved or restored in a way that didn't preserve privileges.
- The PDS files and Users & Groups data file are out of sync.

See Related Topics on Access privileges for more info.

If you have backed up the PDS file for that volume, you can restore it to the root level of the volume. Otherwise, use the Web & File Admin program to set up privileges for the volume or folder again.

Problems creating drop boxes

Drop boxes must be created inside a share point. Assign the Read Access Privilege to the share point and assign Write Only access to folders inside the share point that are to be used as drop boxes. Give the owner of the Drop Box all privileges.

Users have access to your personal files

In general, keep personal files in a separate folder that is not shared.

Verify that you have not inadvertently given administrative privileges to users.

Guest access grayed out

Server administrator must allow user "Guest" privileges to log into the file server.

Volumes grayed out

Server administrator must allow users at least "read" access to share points in order for users to mount the volume.

Users can't access new folders created on the server

Access privileges to the parent folder not set up correctly. See Related Topic on common privileges problem for more information.

Web visitors see "authorization failed" message

If logging in as a guest, verify that server administrator has allowed guest Web access.

Verify that proper privileges have been set up for the folder designed the "Web" folder; this folder needs privileges enabled, but does not have to be made a share point.

Verify that correct username and password are being used.

Published Date: Feb 20, 2012

AppleShare IP 6.0: Troubleshooting Mail Service

This article includes tips for troubleshooting common issues with AppleShare IP 6.0 Mail service.

This article has been archived and is no longer updated by Apple.
As a general rule when dealing with mail server issues, check the mail server log and error log first. They will most likely indicate what the situation is.

Mail Server won't start up

Check the Mail Server log and Error logs from the Mail Admin program for indications of what the problem is. Possible issues include:

- Mail Server requires version 8.1 or later. Mail Server requires OT 1.3 or later.
- Mail Server requires ASIP 6.0 or later. Users & Groups services have become disabled.
- Insufficient memory.
- Another service is using the SMTP TCP/IP port.
- Another service is using the POP3 port. Another service is using the SMTP AppleTalk port.
- Another service is using the POP3 AppleTalk port.
- Disk space on volume is insufficient for creation of mail database.
- Mail Server requires thread manager.
- Mail Server requires a PowerPC processor. The processor is too old.
- Machine name must be set up in File Sharing control panel.
- No transports are available.
- OT TCP/IP is not available.
- The Mail database is unusable.
- Version mismatch of mail server and mail database.
- File system error.
- Wrong file error.
- Not enough disk space to start up.
- TCP/IP not configured properly.
- Mismatches between mail database and current Users & Groups Data file. This can occur if:
    - User accounts are deleted when mail server is not running.
    - A Users & Groups database is restored from backup.
    - The mail database was moved to another machine with a different Users & Groups data file.
    - The mail database is corrupt.

Note: Issues with the mail database itself may be corrected using the ASIP Mail Tool, which can update and repair databases, as well as allow assignment of mail in disabled mailboxes to other users.

Clients can't connect to ASIP Mail Server

- Verify that mail server is running.
- Check mail server log and error log for indication of problems; you may see messages such as:
    - Logon failed due to incorrect password
    - Logon failed because log on was disabled
    - Log on failed because user does not have mail enabled.
    - POP3 user is already logged on; duplicate POP3 sessions not allowed.
    - POP3 Server-unknown mail user
    - APOP Authentication for user failed.
    - Logon failed because APOP is required. User must delete mail to access older messages. No mail has been lost.
- Verify that affected clients have mail enabled, and client software supports protocols enabled (POP, IMAP).
- Verify settings in mail client software.
- If the user's mail account is set up for an APOP-encrypted password, make sure that the user's client is configured appropriately.
- If the user is having trouble receiving replies to mail that he or she has sent previously, make sure that the user's E-mail address is correctly set up in the client mail application's return information field.
- Check IP connectivity between clients and server.

Clients can't send mail to ASIP Server

- Check mail server log and error log.
- If mail is addressed to a user on the ASIP server, verify that mail is enabled for that user.
- If message includes enclosures, verify that size does not exceed limitations set at the server (Mail Server Settings: Mail in). Also verify that there is sufficient volume space on the volume where mail is stored (Mail Server Settings:General).
- If messages are being returned to user marked "no such user" or "host unknown", verify destination email address.

ASIP Mail Server has problems sending/receiving mail

- Verify that mail server is running.
- Check mail server log & error log.
- Verify IP connectivity at the server.
- For problems receiving mail, verify DNS entries are correct.
- Mail server should have static IP address
- Mail exchangers for mail server should point back to itself, with lowest preference value. For example, server "mail.acme.com" should have MX record of "10 mail.acme.com"
- If using domain name for email addresses instead of a permanent host (for example, user@acme.com instead of user@mail.acme.com), verify that an MX-only record has been created for "acme.com" with mail exchanger pointing to the actual mail server "mail.acme.com".
- Verify that the domain name is registered on the Internet. You can do so by using a Web-interface to the "whois" command; search on your domain name and verify that primary name server's IP address is correct.
- Check restrictions that you've set up on the mail server:
- Check Mail Server Settings: Mail In: Is "Reject Mail if destination is not in Host List checked"
- If so, 'Show Host Lists' and add hosts as needed.
- Check 'Show Host List': if host is listed, check settings: Mail From: Is "allow mail from host" enabled.

Mail server can't connect to one particular mail server

- Check mail server log & error log.
- Check restrictions that you've set up on the mail server:
- Check Mail Server Settings: Mail In: Is "Reject Mail if destination is not in Host List checked."
- If so, 'Show Host Lists' and add hosts as needed.
- Check 'Show Host List': if host is listed, check settings: Mail From: Is "allow mail from host" enabled.
- SMTP mail servers use port 25 for the exchange of mail with mail servers. If possible, verify that port 25 is enabled on the other computer by Telnetting to port 25. If your browser is configured to use a supporting application for Telnet connections, such as NCSA Telnet, you can use the following URL from the mail server to attempt to connect to the other host:

  ```
  telnet://other.host.com:25
  ```
- Or, if using a Telnet application, such as NCSA Telnet, simply enter the host name, a blank space, and the port number in the "open connection" window, for example:

  ```
  other.host.com 25
  ```
- The host, if listening on port 25 (SMTP port), should respond that it is "ready":
  If this connection is refused, try pinging the other mail server with a ping utility. If you can ping the host, but get no connection at port 25, then the problem could be one of the following:
  - Perhaps mail service is not running at the moment; wait and try again later.
  - Firewalls may be preventing the connection.
  - Perhaps you are using the wrong address; the host may not be a mail server at all.
- If you can neither ping nor telnet to the other mail host, test pinging another device on the Internet to verify your own connections.
- If your connections work, perhaps a router is down somewhere between your mail server and the other host, or the other server is down temporarily for maintenance.

Users report that "Reply All" doesn't work

Verify that the reply uses a fully qualified domain name for each recipient.

If the recipient is a group, make sure that mail or mail forwarding is enabled for each group member.

AppleShare IP 6.0: Troubleshooting Network Connectivity

This article includes general tips for troubleshooting common problems connecting to the ASIP Services.
This article has been archived and is no longer updated by Apple.

No Zones in Chooser

Zones are created by AppleTalk routers, and divide network devices into logical groupings. When a computer tries to get on the network (either at system startup, or when the AppleTalk port is switched from one port to another), it does the following:

- Tries to obtain an AppleTalk address dynamically
- Checks for routers on the network
- Verifies its address against information it received from the router
- Requests information for the network from routers, such as zone names
- Registers its own services, such as its Macintosh name for file sharing.

If, on a zoned network, no zones appear in the Chooser, check the following:

- Is the correct port selected in AppleTalk control panel?
- Are network cables connected properly? Can other devices on the network see zones? If not, the problem may be the router is down or a problem with network in general; report the problem to the network administrator.
- Can you swap networking hardware with another device that's working, and see zones? If so, suspect networking hardware.

Otherwise, suspect software, and try the following:

- Reset PRAM Re-select correct port in AppleTalk control panel.
- Restart with Mac OS only extensions Toss AppleTalk preferences, restart, try again.
- Test IP connections on the port, if possible, to verify that the network itself is available.
- Run Disk First Aid or other disk utility.
- It may be necessary to reinstall Open Transport, or a clean system folder.

File Server not appearing in Chooser

Verify file server name and zone name. See if anyone else can see it in the Chooser (may be network problems). Verify that the Web & File server is running. Verify port selected in AppleTalk control panel on both server and client.

Guest access grayed out

User "guest" does not have file service enabled at Web & File server. Server administrator must allow guests to log into the file server.

Volumes grayed out

If the volumes that appear in the File Server's volume list in the Chooser appear disabled or grayed out, it indicates that the user does not have any "read" privileges to the share point. Server administrator must allow users to at least "read" at the share point level, for users to mount the volume.

"Server not responding" message

AppleShare IP servers with AFP over TCP enabled will attempt an IP connection whenever the client and the server are configured for TCP/IP. Occasionally, although both client and server are configured for IP, there is no IP connectivity between them. (This might happen is there were no IP router between the client's network and the server's network.). In these cases, try to force an AppleTalk connection, instead of allowing the software to attempt an IP connection. See next step for details.

Forcing an AppleTalk connection

AppleShare client software 3.7 and above will attempt to make an IP connection to the AppleShare IP server whenever this feature has been enabled at the server, and the client is also configured for TCP/IP. To prevent this, and force an AppleTalk connection:

Open Chooser. Select AT zone of file server (if on a zoned network) Select AppleShare Client icon in upper-left quadrant of the Chooser. Hold down the Option-Key when selecting the file server's name in the upper-right quadrant of the Chooser.

Try this whenever you see a "server not responding" message, as indicated in the question above.

Can't connect using TCP/IP

If the client's connection is made via AppleTalk instead of TCP/IP (this should be done behind the scenes if everything is set up right), check the

following:

- Verify that the client is configured for TCP/IP (control panel).
- Verify that the server is an ASIP server with "AFP over TCP/IP" enabled. Personal File Sharing does not support AFP over TCP/IP, nor do previous versions of the AppleShare Server Software (pre-ASIP 5.x), and possibly other types of file servers; in these cases, you can only connect using AppleTalk.
- Attempt the connection using the "Server IP Address..." button in the AppleShare client software. If this button is missing, update client software to version 3.7.4 or later.
- Test IP connectivity between the client and server.

Client stops responding when logging in to the server.

This problem is currently under investigation at Apple. The symptom is that the client stops responding when attempting to log into the server, just at the point where the server volumes are expected to mount. Force-quitting the Chooser sometimes allows the client to continue. Many have reported that this issue does not affect the administrator user, only other registered users.

Workaround: Disable the "Remember Recent" feature of Apple Menu Options control panel. (Changing values to "0" is not sufficient, the feature must be turned off).

IP Connections

Verifying IP connections

Whenever clients report issues accessing IP services, it's good practice to verify IP connectivity at the client and at the server. Even if the client connected successfully in the past, many different things could cause unsuccessful attempts at any time, such as:

- TCP/IP settings accidentally changed
- Routers down
- DNS services down
- Duplicate IP address appears on the network.
- Address server (DHCP, BootP) not functioning/not accessible.
- Some system files or TCP/IP preference files may be unusable.

Ping Utilities

Testing IP connectivity is often done using utilities that send ping packets. Ping packets are simply small packets from one host to another, that request a response from the recipient. Many ping utilities are available for free download on the Internet. One favorite is MacTCP Watcher. Some sort of ping utility is invaluable when troubleshooting IP connections, and the following suggestions are assuming that some ping utility is available.

If no ping utility is available, then use whatever IP applications are at hand, the simpler the better. Remember that the device you're attempting to contact has to support the service that the client software is trying to reach. For example, you may be able to use a Web browser to test a connection with another computer that has Personal Web Sharing enabled, but you can't use it to test a connection to your router.

Here's a suggested troubleshooting path for isolating issues with a client trying to connect to the host.

1. Ping the host using its Domain name.
If pinging succeeds, then there's no issue with the client or the IP connection between client and host. Next step would be to check the applications at client and host, and look for problems there (Web server, file server, mail client, etc.).
If pinging fails, it could indicate an issue with the routers or DNS servers, not necessarily with the workstation itself. Go on to the next step.

2. Ping device on local subnet using IP address.
Pinging a device on your same subnet using its IP address does not require routers or DNS servers to be successful, so it verifies that each machine is able to communicate, at least on its own subnet, using TCP/IP.
Note: Be sure that the workstation you are attempting to ping has its IP stack (i.e., protocol set) initialized. Most Macintosh computers do not initialize the IP stack until an application that uses IP is launched. On the computer you'll be pinging, launch an IP application, such as the Web browser or a ping utility, to initialize the stack before attempting the ping.
You can determine which other devices are on the same subnet by checking the physical connections (are they connected to the same hub? or same bus?) or by checking their IP addresses (are the network portions of the IP addresses identical? You have to consider the IP address AND the subnet mask to determine this).
If pinging a device on the same subnet is successful, you've verified that the computer's IP connections are working, but there still may be some issue with external network devices, such as routers, DNS servers. Continue on with the next step.
If pinging a device on the same subnet fails, then you need to check carefully the local software and hardware configurations. Here's some tips on how to do that:

3. See if any other device on same subnet can ping other devices. This will let you know if the local network is functioning, and if basically

the IP addresses have been set up correctly.

4. If server addressing is being used, see if you can test with a manual address, to see if problem is with communications between the client and address server.

5. Check TCP/IP configurations carefully; compare them with that of a computer that is working properly: verify link being used, IP address, subnet mask, and router information, whether "802.3" is checked (Advanced mode).

6. Check network connections to make sure they're not loose.

7. Swap out non-working hardware with a working machine to test AppleTalk on the same link if possible.

AppleShare IP 6.0: Sharing Files With Windows Clients

This article reviews some important guidelines when sharing files with Windows clients.
This article has been archived and is no longer updated by Apple.
Since Mac OS and Windows computers store and maintain files differently, you should understand the differences to avoid any issues. This information is also found in the AppleShare IP (ASIP) Help files.

The general Windows file sharing guidelines are as follows:

Separate Shared Folders
Create separate shared folders for Windows users and ask them to use only these folders. Windows users can damage Macintosh files (especially applications) by opening or moving them. Keeping the two types of files in separate folders minimizes accidental damage.

Access privileges
Use access privileges to prevent Windows users from inadvertently making changes to Macintosh-only files. Some Mac OS file information, such as the resource fork of files and applications, is lost when a file is copied from a Mac OS computer to a Windows computer. Don't grant Windows users access to folders containing Mac OS-only files.

Use the correct application when modifying files
When users modify files, they should use the same application that created them to open and change them. Although many files can be opened by applications other than those that were used to create them, using a different application to make changes can permanently make a file unusable.

Use DOS file-naming conventions
Whenever possible, use the DOS file-naming convention for naming shared files. The DOS file system supports file names of eight or fewer characters with an optional extension consisting of a period and three or fewer characters. Most special characters (spaces, asterisks, brackets, and so forth) are not allowed. DOS file names are not case-sensitive.

Use Short Name Command
The Web & File Server processes names of files that do not conform to DOS naming conventions so that Windows users can see them. This functionality is always enabled in AppleShare IP 6.

Remember 31-character length limitation
The Web & File Server truncates Windows 95 file names that are longer than 31 characters to 31 characters.

AppleShare IP 6.0: Setting Up Mac OS LPR Client

This article describes how to configure the LPR Client Software--Desktop Printer Utility--on a Macintosh.
This article has been archived and is no longer updated by Apple.
LPR Client Setup Setting Printer-Specific Options

Requirements:

LaserWriter 8.5.1 requires:

- System 7.1.1 or later Minimum 8 MB of RAM

LPR printing in LaserWriter 8.5.1 requires:

- Mac OS 7.5 through 7.5.1 or Mac OS 8.1 (Mac OS 8.0 users need to upgrade to Mac OS 8.1) Open Transport

Availability:

The Desktop Printer Utility (DPU) is automatically installed with Mac OS 8.1 It is also available on Apple Software Updates.

The DPU will be installed in one of two places:

- Installed with Mac OS 8.1: Hard Drive:Apple Extras:Apple LaserWriter Software
- Installed from LaserWriter 8.5.1: Hard Drive:Apple LaserWriter Software

Instructions:

1. Launch the Desktop Printer Utility.

2. Select "Printer (LPR)" and click "OK".

3. Click "Change..." in the PostScript Printer Description (PPD) File section. This brings up the hard drive:System Folder:Extensions:Printer Descriptions folder. Select the PPD for your printer. The icon for your printer will now show up in the upper box.

4. Click "Change..." in the Internet Printer section.

5. For Printer Address, enter the IP address or the domain name of the ASIP print server.

6. For Queue, either the queue name exactly as specified by the print server (get this information from the server administrator). Leaving this section blank will cause the print job to go to the default Print queue specified by the server administrator.
Important: The queue name is case-sensitive.

7. Verify: The optional verify button will check to see if there is an LPD printer or print server at the specified printer address (packet sent to port 515). This does not verify the queue name. However, it is a good idea to click the verify button to make sure that the computer can at least reach the destination printer or print server.

8. Click on "OK" when you are finished with this window.

9. Select Save from the File menu or hit Command-S.

10. Change the name and decide where the file will be saved. The default name is the IP address or domain name that you entered for the internet address. The default location is the desktop. Click "Save" and the desktop printer will be created.

Next:

1. Select New from the File menu if you wish to create another desktop printer, or Select Open from the File menu if you wish to modify an existing desktop printer, or Quit the Desktop Printer Utility.

2. To make the new desktop printer the default printer, select it on the desktop, and choose "Set Default Printer" (command-L) from the Printer menu.

Setting Printer-Specific Options:

Unlike when printing via AppleTalk, the Desktop Printer will not be able to automatically detect the printing options installed on your printer (such as duplex unit, or cassettes installed). To configure your printer-specific settings:

1. Select your desktop printer.

2. Go to the Printing menu and select "Change Setup..."

   Selecting the "Change..." button will allow you to change the PPD in case you selected the wrong one earlier.

   Selecting the "Change:" pull-down list will allow you to select one of the installable options. The list of options will vary depending on the PPD you selected. * Selecting the "To:" pull-down list will allow you to select a setting for the currently selected installable option.

3. Click OK when you're done setting the options.

AppleShare IP 6.0: Print Server Security

This article provides detailed information about how AppleShare IP 6.0 Print Server security works.
This article has been archived and is no longer updated by Apple.

How ASIP Print Server Provides Security

The security implementation in ASIP 6.0 is a 'casual' security measure. It simply checks authorization to print to the print queue.

The security feature of ASIP Print server WILL:

- match the user name in the print job with the list of authorized print users.
- check AppleTalk printing and LPR printing.
- use the Web & File Server Users and Groups database.

It will NOT:

- encrypt data
- check against the computer's name
- check against the computer's hardware address, AppleTalk address, or IP address
- affect behavior (i.e.: you cannot change priority or switch queues based on user name)

How it works

When you print using a Postscript driver such as the LaserWriter 8 driver, a PostScript print job is created. The beginning of each print job contains certain information about the print job. These comments are defined by Adobe as part of the Document Structuring Convention (DSC) for the PostScript language. Here is an example of the beginning of a LaserWriter 8.5.1 print job:

```
%!PS-Adobe-3.0
%%Title: (security.htm)
%%Creator: (Claris Home Page 3.0: LaserWriter 8 8.5.1)
%%CreationDate: (2:32 PM Thursday, May 28, 1998)
%%For: (Raines, Claude)
%%Pages: 1
%%DocumentFonts: Times-Bold Times-Roman
%%DocumentNeededFonts: Times-Bold Times-Roman
%%DocumentSuppliedFonts:
%%DocumentData: Clean7Bit
%%PageOrder: Special
%%Orientation: Portrait
%%DocumentMedia: Default 612 793 0 () ()
%ADO_ImageableArea: 8 11 603 782
%%EndComments
```

When security is enabled, the print server looks at the print data for the first instance of "%%For:" (There may be more than one in the print job). The LaserWriter 8 driver fills in the "%%For:" comment with the Owner Name in the File Sharing control panel. Other operating systems usually use a login name.

The Print Server reads the name after the "%%For:" and tries to match it in the authorized list of users for that print queue. If there is a match, the job may continue. If there is not a match, the print request will be refused.

Since the security checking is done by looking at the PostScript data itself, this security method works the same way for both AppleTalk and LPR printing.

Known Issues

Security doesn't work when printing from Windows NT.

Security may not work with some PostScript printer drivers, operating systems.

The Windows NT PostScript driver does not include the "%%For:" DSC comment. Since the security mechanism doesn't include a name to match with the list of authorized users, it refuses the connection. A security violation will appear in the Print Server log.

Any PostScript printer driver/operating system that does not include the "%%For:" DSC comment will have this issue. The error message may vary from OS to OS.

Identification: Print to file. Open the file in a text editor. Look for a line that starts with "%%For:".

Solution:

Turn off security or find a driver that includes the "%%For:" DSC comment.

Security follows the data, not the user.

The name in the "%%For:" comment is determined at the time the PostScript data is generated, not at the time the PostScript data is sent to the printer.

Scenario: Person #1 prints to a file and hands the file to person #2. Person #2 sends the job to a secured ASIP print queue. ASIP will check security against person #1, not against person #2, because the PostScript file has person #1's name.

Solution:

Turn off security or open the file in a text editor and change the name.

The Apple Printer Utility does not work with security activated

The Apple Printer Utility does not follow the DSC standard. The connection is refused as soon as you try to open the print queue in APU.

Solution:

The main reason to use APU on a print queue is to download a PostScript file. In LaserWriter 8.5.1, you can now drop PostScript files on the desktop printer icon.

AppleShare IP 6.0: Description

This article provides a description of AppleShare IP 6.0.
This article has been archived and is no longer updated by Apple.
If you need a powerful yet simple way to communicate and exchange information, you'll find AppleShare IP 6.0 software an invaluable tool. Just install any combination of its integrated file, print, mail, and web servers as needed. Basic setup takes only minutes, and all administration is done through a single, easy-to-use interface. The services of AppleShare IP 6.0 work over TCP/IP and AppleTalk networks, and its native SMB support for Windows clients means it looks just like a Windows NT file server in the Network Neighborhood on Windows.

Because it offers SMB and FTP as well as traditional AppleShare file sharing, AppleShare IP 6.0 lets authorized users access information via an AppleTalk network, your intranet, or the Internet. Version 6.0 is optimized for exceptional performance across today's high-speed networks. The included AppleShare Client software for Mac OS-based computers automatically uses the faster TCP/IP protocol when both it and AppleTalk are available. For FTP clients, files are encoded on the fly, eliminating the need to store separate files for AFP and FTP users.

Printers and workstations can be on any combination of AppleTalk and TCP/IP networks. AppleShare IP 6.0 software can reduce time wasted waiting for printouts by automatically sending each print job to the next available printer.

Electronic mail has become an indispensable service for any organization. AppleShare IP 6.0 supports the SMTP, POP, and IMAP protocols, allowing you to select the best client- or host-based solution for your users. Intelligent mail handling saves bandwidth and disk space when the same message is going to multiple recipients. Flexible and powerful administrative features ensure that your mail system continues to run smoothly.

AppleShare IP 6.0 software even includes a built-in web server so your organization can set up its own intranet and Internet web sites to share information. Built-in support for plug-ins and CGIs lets you add your own powerful features to the server, while storage of all web files in one protected folder protects other files on the server from access by web users.

For maximum ease of use, all AppleShare services share the same administrative console. You can set up basic services in minutes and assign privileges for any service through a consolidated "Users and Groups" list. You can even use the same list for multiple functions within one server, such as defining both access privileges and group e-mail addresses.

Key Features

Powerful file transfer capabilities

- Transfer files faster than ever
- Access files over an AppleTalk network, your intranet, or the Internet
- Provide native (SMB) file services to Windows clients
- Store a single copy of each file for both FTP and AFP users
- Use aliases to reduce disk space requirements

Efficient print services

- Support users and printers on any combination of TCP/IP and AppleTalk networks
- Control user access on a per-queue basis
- Enjoy automatic load balancing across as many as 10 printers per queue
- Use server-side PPDs so that client systems don't have to have a PPD for every different printer

Versatile e-mail support

- Offer any combination of IMAP, SMTP, and POP
- Permit users to have both IMAP and POP mail-boxes for greater flexibility in retrieving their mail
- Save disk space and bandwidth use with single-copy message storage for multiple recipients
- Enable sophisticated searches on mail content

Ready-to-use web server

- Provide high-speed throughput with up to 25 million connections per day
- Let your users share information efficiently and creatively by publishing their own web pages
- Add functionality through plug-ins and CGIs
- Protect other files on the server by storing all web files in one secure folder

Integrated administration

- Set up, manage, and reconfigure all AppleShare IP 6.0 services through a single interface
- Leverage the same "Users and Groups" list to define multiple services or multiple functions within a single service
- Add custom user authentication modules for more control over server access

Ordering Information

All packages include:

- AppleShare IP 6.0 software CD
- Mac OS 8.1 software CD
- AppleShare IP 6.0 Getting Started manual

AppleShare IP 6.0 10-Client Version
Order No. M6636Z/A

AppleShare IP 6.0 50-Client Version

AppleShare IP 6: Technical Specifications

This article provides the technical specifications for AppleShare IP 6.0.
This article has been archived and is no longer updated by Apple.

File server

- File-sharing protocols supported:
  - Apple Filing Protocol (AFP) over TCP/IP and AppleTalk
  - Server Message Block (SMB) over TCP/IP
  - File Transfer Protocol (FTP) over TCP/IP
- Files automatically encoded by AppleShare IP when requested by an FTP client
- Dynamic file and directory caches for expedited delivery of frequently requested files
- Support for anonymous FTP sessions (users get the same privileges as AppleShare "Guest" accounts)
- Maximum number of connected users (depending on your license agreement); 10, 50, or 500 over TCP/IP; 10, 50, 250 over AppleTalk. **Note:** If you expect your network usage to exceed 250 connected users, Apple recommends a minimum of 128 MB of RAM and Macintosh Server G3 or Power Macintosh G3 as the server.
- Maximum unique open files: Approximately 300
- Maximum number of all open files: 3,000 forks (data and resource)
- Maximum number of physical volumes: 50
- Maximum number of share points: 100
- Maximum number of users and groups in the Users and Groups data file: 10,000. **Note:** If you expect to have more than 5000 users, Apple recommends a Macintosh Server G3 or Power Macintosh G3 as the server.
- Maximum group memberships per user: 42
- Maximum number of simultaneous launches of network applications: Up to 250 (depending on application licensing and the number of connected users).
- Maximum volume size: 2 terabytes
- Maximum number of multihomed ports (AppleTalk only): 4
- AppleShare file sharing TCP port number: 548
- FTP port numbers: 20 and 21
- Windows file sharing TCP port number: 139
- Windows network neighborhood UDP port number: 138
- Windows name service UDP port number: 137

Print server

- Supported protocols: PAP (AppleTalk) and LPR/LPD (TCP/IP)
- Supported printers: Apple LaserWriter printers, third-party PostScript printers that support the LaserWriter 8.4 (or later) printer driver, and LPR/LPD-compatible printers
- Font storage on server to minimize downloads from client system
- Maximum number of attached printers: 30
- Maximum number of queues: 10
- Maximum number of printers per queue: 10
- Maximum number of concurrent connections: 32
- Maximum total number of jobs: 500
- Maximum log file size: 64k

Mail server

- Mail protocols supported:
  - Internet Mail Access Protocol (IMAP)
  - Simple Mail Transfer Protocol (SMTP)
  - Post Office Protocol (POP)
  - Authenticated Post Office Protocol (APOP)
  - (PASS), port 106
  - Finger, port 79
  - Notify Mail, port 79
- Shared folder support conforms to Internet standard RFC 2086
- Mail storage in a single database instead of as separate mail files
- Maximum message size: 512MB
- Maximum recipients per message (before expansion of group names): 512
- Supported character sets: 1-byte and 2-byte (through 8-bit transparency)
- Maximum number of transfers per POP connection: 2,048
- Maximum number of incoming connections: 1,024

- Maximum number of POP and IMAP connections: 2,048
- Maximum number of IMAP folders per user: 1,000
- Maximum number of messages per IMAP folder: 1,000
- Maximum number of outgoing SMTP connections: 64
- Maximum folder name size: 128 bytes
- Maximum IMAP folder path depth: 32 folders or 256 characters
- Maximum number of unique messages stored on the mail server: Approximately 1,000,000
- Maximum size of the AppleShare IP Mail 6 Data file: 2GB
- Maximum size of the mail database folder: 4GB

Note: You may need to increase the amount of memory allocated to the Mail Server program (in the Extensions folder in the System Folder on your server's startup disk) in order to achieve these maximum settings.

Web server

- Maximum number of connected users: 150 **Note:** A computer connected through the AppleShare IP Remote Admin program is included as one connection.
- Idle connection timeout: 60 seconds
- CGI timeout: 60 seconds
- Keep alive: supported
- Web protocol supported: Hypertext Transfer Protocol (HTTP) 1.1
- Common Gateway Interface (CGI) support for extending the capabilities of the web server
    - Access logs
    - Directory browsing
    - Customizable error pages
    - Support for keepalives
    - WebSTAR API support: Version 1.2
- Web service port number: 80
- Remote Admin port number: 311

Minimum System Requirements

- Power Macintosh computer with a PowerPC G3, 604e, 604, or 601 processor; Macintosh Server G3; Apple Workgroup Server with a PowerPC 604e, 604, or 601 processor; or Power Macintosh 6500 computer
- Mac OS 8.1 or later.
- Open Transport 1.3 or later. **Note:** TCP/IP Filtering requires Mac OS 8.5 and Open Transport 2.0 or later.
- OpenDoc 1.2.1 or later software (included)
- 48MB of RAM with virtual memory turned on; 64MB of RAM without virtual memory
- CD-ROM drive
- AppleTalk or TCP/IP network connection

Hard Disk Driver: Identifying It And Ensuring Compatibility

This article explains what a hard disk driver is and how to identify it by name and version number--information essential to establishing its compatibility with the Macintosh operating system.
This article has been archived and is no longer updated by Apple.
The identity and version of a hard disk's driver can usually be obtained from the Get Info window:

1. Select the hard disk icon on the desktop.
2. Choose Get Info from the File menu.

Figure 1 Macintosh HD Info window

The "Where:" section shows first the drive's name, then information (highlighted in the example shown) that will vary with the program used to install the driver, such as:

- The manufacturer of the driver.
- The version number of the driver--often the same as the version of the disk utility that installed it.
- The SCSI ID, SCSI bus number, or ATA bus number, depending upon the drive type and where it is connected.
- Other technical information, such as whether the driver is asynchronous or has blind writes enabled.

Distinguishing an Apple driver from a third party driver

Disk drives that have been initialized with Apple's Drive Setup will show something like the following for a SCSI drive and an IDE or ATA drive, respectively:

Where: Macintosh HD, SCSI ID 0 (v8.0.9)
Where: Macintosh HD, Internal (ATA 0, v3.1.0).

When a third party driver is installed, the content or arrangement of this information will frequently differ, and a manufacturer's name is the most common indicator. The following list identifies some of the most common driver manufacturers and the utilities they have made to install them. Thus, in the example pictured, "CharisMac" confirms that a driver created by CharisMac Engineering, Inc. is present, and Anubis version 2.5.6 is the utility that installed it.

- Hard Disk Toolkit, by FWB Software
- Silverlining, by La Cie, Ltd.
- FormatterFive, by Software Architects, Inc.
- Anubis, or APS PowerTools, by CharisMac Engineering, Inc.
- DiskWorks, and Micronet Utility, by Micronet Technology, Inc.
- Drive7, and Formation, by ProSoft Engineering, Inc.

Once the driver's name and version have been determined, compatibility with the Mac OS version in use can be confirmed with the driver manufacturer. An incompatible hard disk driver can cause software conflicts, formatting structure corruption, and data loss.

For more specifics on the driver version numbers that Drive Setup installs, please see the following article:

Article 22167: "**Apple Hard Disk Driver Matrix**"

About Hard Disk Drivers and Why They Are Important

Devices communicate with applications and with the operating system through special programs called device drivers. A device driver typically controls a specific hardware device.

The device driver for a hard disk controls the process of reading from and writing to the disk. It resides outside of the Macintosh volume, which is the accessible part of the physical disk represented by the hard disk icon. As such, it is not a visible resource that can be created or modified in the usual way, requiring instead the use of a specialized disk utility like Apple's Drive Setup.

When troubleshooting for the causes of software conflicts and data corruption, the influence of the hard disk driver is often overlooked. When a later version of the Mac OS is installed, a later version of the hard disk driver must often be installed as well. The system installers for Mac OS 8

and later check for the presence of an Apple hard disk driver and update it automatically, but if a third party hard disk driver is detected, such as on a third party hard drive or a drive that was formatted with a third party disk utility, the installer will only warn that the driver may need to be updated for compatibility. There is nothing wrong with having a third party hard disk driver installed, so long as it is compatible with the Mac OS.

Finally, note that though Drive setup can often, via its initialization function, install its driver onto a third party drive, the Apple driver's compatibility in that configuration is untested and unsupported. Conversely, it is acceptable to use Drive Setup in that fashion to replace the third party driver on an Apple drive.

Apple LaserWriter Drivers: Windows 98 Compatibility

Is the Apple LaserWriter driver software for Windows 95 v.4.2.2 compatible with Windows 98?
This article has been archived and is no longer updated by Apple.
Apple has not tested any version of the Apple LaserWriter Driver for Windows 95 with Windows 98. However, both Microsoft and Adobe Systems have PostScript drivers that have been tested under Windows 98. Apple recommends you use the Microsoft or Adobe driver with Windows 98.

Adobe

Adobe's PostScript Printer Driver, AdobePS, provides full support for Windows 98 as of version 4.2.4. This driver is available at their web site. During installation, you may need to know the location of the PPD file for your printer. Most Apple LaserWriter printers will show up under "Apple" in the list of printers drivers that are included with Windows 98. The major exception is the Apple LaserWriter 8500. Apple LaserWriter 8500 customers can find the PPD file for this printer in the following directory of the CD-ROM disc that shipped with their printer:

```
\\WIN_OS\\WIN_95\\APPLE\\DISK3
```

Microsoft

Microsoft includes a PostScript driver with Windows 98 that will allow you to print to most Apple LaserWriter printers. Since this is not an Apple printer driver, we will be unable to assist you with any issues you may encounter with this PostScript driver.

Most Apple LaserWriter printers will show up under "Apple" in the list of printers drivers that are included with Windows 98. The major exception is the Apple LaserWriter 8500. Apple LaserWriter 8500 customers should follow these steps to use the Microsoft-supplied PostScript driver with this printer:

1. Open the Printers folder.
2. Run "Add printer"
3. Follows the instructions on the first couple of screens.
4. You will get a list of printers from which to choose.
5. Click on "Have Disk..."
6. Insert the Apple LaserWriter 8500 CD-ROM disc that came with your printer
7. At the prompt, enter `D:\\WIN_OS\\WIN_95\\APPLE\\DISK3`. If your CD-ROM drive is not drive D:, substitute the drive letter with the drive letter of your CD-ROM drive.
8. Click OK.
9. Select Apple LaserWriter 8500 from the list that appears.
10. Click on Next.
11. Follow the rest of the directions on the screen.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following Knowledge Base article can help you search for a particular vendor's address and phone number:

Mac OS X Server: Setting File And Folder Permission

This article describes how to prevent others from changing the contents of files and folders.
This article has been archived and is no longer updated by Apple.
To prevent others from changing the contents of files or folders:

1. In the Workspace Manager, select the file or folder.
2. Choose Inspector from the Tools menu.
3. Choose Access from the Inspector pop-up menu.
4. Use the Access table to change the Write permission.

If the Write permission is not selected, others will not be able to change the contents of the file or folder selected.
Published Date: Feb 17, 2012

AppleShare IP 6.0: Share Point Names Shortened For SMB

If I create a share point with a name longer than 12 characters, the name is converted to a DOS-style 8.3 file name when I view it from a Windows SMB client. Why is this?

This article has been archived and is no longer updated by Apple.

Some Windows clients (Windows 95 for example) do not support share names longer than 12 characters. To ensure compatibility, AppleShare IP 6.0 will automatically convert long share names into the 8.3 (short) naming convention.

Example: If the actual share is named "IS Applications", it will show up on Windows SMB clients as "ISAppl~1".

Mac OS 8, 9: Mac OS Extended Format - Volume and File Limits

What are the limits of file and volume sizes in Mac OS Extended Format (also known as HFS Plus)? What is the maximum number of files on a volume?
This article has been archived and is no longer updated by Apple.
The following table provides detailed information on Mac OS Extended Format volume and file limits for Mac OS 8 and 9.

Mac OS Extended Format: Volume and File Limits	
Maximum number of volumes	21 (2)
Maximum volume size	2 terabytes
Maximum file size	2 terabytes (3)
Maximum data fork size	2 terabytes (4)
Maximum resource fork size	16 megabytes (5)
Maximum number of files	more than 2 billion (1)
Maximum number of files/folders in a folder	32,767

Notes:

1) The actual number of files that can be stored on an HFS Plus volume depends on the size of the volume and the size files. For example, a 4 GB HFS Plus volume with the default block size of 4K, will have one million available blocks. Thus the volume could hold up to a million small files or fewer larger ones. A larger volume with the same default block size could hold proportionately more files.

2) At system boot, the event queue for the Finder can accept 20 volumes plus the startup volume. Once the computer has completed the boot process, you may use a disk utility to mount as many additional volumes as there are available file control blocks. This number is variable depending upon how many applications are running, files open, or other operating system processes which require file control blocks.

3) Under Mac OS 9. Mac OS 8 only supports file sizes of up to 2 GB in size.

4) Mac OS 9 with Mac OS Extended savvy applications can access a fork this size. Mac OS 8.x and Mac OS 9 with applications using the standard HFS APIs can access forks up to 2 GB in size. It not possible to access any data in a fork larger than 2 GB without using the Mac OS Extended APIs.

5) This limit is imposed by the Resource Manager.

6) For Mac OS X 10.2 (or later) and Mac OS X 10.2 Server (or later), the maximum volume size is 8 TB.

For definitions of some of these terms, and for information about Mac OS Standard Format (HFS), please see the following Knowledge Base article: Article 8647: "**Macintosh: File System Specifications & Terms**".

You see "Open Firmware" text and a prompt on your PowerBook‘s screen

When you turn on your PowerBook you see a white screen with this text:

```
Open Firmware, X.XX
To continue booting the Mac OS type:
BYE<return>
To continue booting from the default boot device type:
BOOT<return>
ok
0)
```

This article has been archived and is no longer updated by Apple.

- What is this screen?
- How did I get to this screen?
- How can I get back to the regular Mac OS?
- Which PowerBooks use this?

This screen is the Open Firmware screen. Beginning with Power Macintosh computers equipped with PCI slots, Apple has used a firmware operating system called Open Firmware for controlling hardware.

Open Firmware is a cross-platform firmware standard for controlling hardware and is used by all PCI-based Mac OS computers. Open Firmware is used mainly by Apple hardware developers and rarely is there a need to start up into Open Firmware.

While it is difficult to start up into Open Firmware, it does happen if you hold down the Option-Command-O-F keys when the computer starts up after having been shut down. The PowerBook should never start up into Open Firmware on its own.

If you are at the Open Firmware screen and want to go back into Mac OS, type "BYE" without the quotes at the command prompt, then press the Return key. This exits Open Firmware and continues starting up into Mac OS.

Only PCI-based PowerBooks will start up into Open Firmware. These started with the PowerBook 2400, 3400, and G3/G3 series computers. Previous PowerBook models will not start up into Open Firmware.

PowerBook G3 Series: Battery FAQ

This article contains frequently asked questions (FAQ) regarding PowerBook G3 Series batteries, with answers to those questions. Note that they pertain to the PowerBook G3 Series models that were released in September, 1998.

See also the following Frequently Asked Questions articles pertaining to the September 1998 models of the PowerBook G3 Series computer:

Article 24608: "**PowerBook G3 Series: General FAQ**"
Article 24611: "**PowerBook G3 Series: Features, Configurations, Performance FAQ**"
Article 24612: "**PowerBook G3 Series: Memory FAQ**"
Article 24613: "**PowerBook G3 Series: Design Elements FAQ**"
Article 24614: "**PowerBook G3 Series: Video, Graphics, And Sound FAQ**"
Article 24615: "**PowerBook G3 Series: DVD, CD-ROM, and Hard Drive FAQ**"
Article 24616: "**PowerBook G3 Series: Communications FAQ**"

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. How long does it take to charge the PowerBook G3 Series batteries?
2. How long do you have to swap in a new battery if the PowerBook G3 Series computer is in sleep mode?
3. How long is the battery life of the PowerBook G3 Series computer?
4. What is the watt-hour rating of the battery in a PowerBook G3 Series computer?
5. Who manufactures the battery for the PowerBook G3 Series computer?
6. Does the battery charge while the PowerBook G3 Series computer is in sleep mode? How long does it take to charge?
7. What is the function of the lights on the side of the battery on a PowerBook G3 Series computer?
8. Can I charge the battery or power the PowerBook G3 Series computer with a PowerBook 3400 adapter?
9. Can I use the PowerBook Duo adapter with a PowerBook G3 Series computer? The connectors are the same.
10. Are the PowerBook G3 Series computer's batteries hot-swappable?

Question 1: How long does it take to charge the PowerBook G3 Series batteries?

Answer: If the system is in shutdown or sleep mode, it takes approximately 2 hours to recharge one battery inside the system. Two batteries charge in about 4 hours. The system charges only one battery at a time, just as it discharges one battery before switching to the other one.

Question 2: How long do you have to swap in a new battery if the PowerBook G3 Series computer is in sleep mode?

Answer: You have approximately 2 minutes to swap a battery in sleep or you may lose data.

Question 3: How long is the battery life of the PowerBook G3 Series computer?

Answer: Battery life with one battery installed, power cycling enabled, and some basic power conservation functions is up to 3.5 hours. With two batteries, you will get up to 7 hours of battery life.

Question 4: What is the watt-hour rating of the battery in a PowerBook G3 Series computer?

Answer: The lithium-ion battery is rated at 49 watt-hours.

Question 5: Who manufactures the battery for the PowerBook G3 Series computer?

Answer: We do not reveal the names of our commodities vendors. However, we work with the key manufacturers in the lithium-ion battery market.

Question 6: Does the battery charge while the PowerBook G3 Series computer is in sleep mode? How long does it take to charge?

Answer: The battery does receive a charge while the system is in sleep mode. The following table shows the charging time for the battery.

Machine off - Full Charge, 80% level one battery in around 2 hrs
Machine in sleep - Full Charge, 80% level one battery in around 2 hrs
Machine on (no PC Card, two batteries) - 80% level one battery in around 3 hrs
Machine on (no PC Card, one battery) - 80% level one battery in around 3.5 hrs
Machine on (has PC Card, one battery) - 80% level one battery in around 4.5 hrs

Question 7: What is the function of the lights on the side of the battery on a PowerBook G3 Series computer?

Answer: The four lights on the outside edge of the battery are the battery charge indicators. By pressing the button next to the lights, you will see how much charge is left in the battery. The battery indicates how much it is charged in one-quarter increments, from 25% to 100%. These lights

also illuminate when the system is plugged into AC power and is charging, to let you know how much the battery has charged over a period of time.

Question 8: Can I charge the battery or power the PowerBook G3 Series computer with a PowerBook 3400 adapter?

Answer: You can charge the battery or run the system using AC power with a PowerBook 3400 adapter. However, charging times will vary, especially when you charge while the system is on.

Question 9: Can I use the PowerBook Duo adapter with a PowerBook G3 Series computer? The connectors are the same.

Answer: You can use the PowerBook Duo adapter to charge the system, but it is not as powerful as the PowerBook G3 Series adapter and will therefore take much longer to charge the battery. The Duo adapter will only charge the battery when the PowerBook is sleeping or off. We do not recommend using this adapter. It is always best to use the adapter that came with your system.

Question 10: Are the PowerBook G3 Series computer's batteries hot-swappable?

Answer: If the system is connected to AC power or operating with two batteries, then the batteries can be hot swapped. When using a single battery, the battery should be swapped only when the system is in sleep mode or shut down. Otherwise, the system will crash because you have removed the primary power source.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Questions answered in this article:

1. Why don't the 800x600 and 640x480 pixel resolutions look as sharp as the 1024x768 native resolution on my PowerBook G3?
2. Can I add the resolution scaling capability to the PowerBook I already own?

Question 1: Why don't the 800x600 and 640x480 pixel resolutions look as sharp as the 1024x768 native resolution on my PowerBook G3?

Answer: Traditionally notebooks have been limited to one resolution because LCD displays are digital in design and have a fixed number of pixels-the native resolution (e.g. 1024x768). You can now increase the size of, or zoom, the images on your PowerBook computer's built-in 14-inch display by switching from the native 1024x768 resolution to a scaled resolution--either 800x600 or 640x480. The new larger image is remapped into the fixed pixel space of LCD display. This remapped image is optimized by interpolation and anti-aliasing technology. Because they are being remapped, the scaled resolutions will not appear as sharp as the native resolution.

Question 2: Can I add the resolution scaling capability to the PowerBook I already own?

Answer: No. The resolution scaling feature is enabled by a combination of software and hardware provided with the new PowerBook G3 Series.

Article 24616: "**PowerBook G3 Series: Communications FAQ**"

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Is it possible to add more memory to the PowerBook G3 Series computer?
2. What is the maximum amount of memory that can be installed on a PowerBook G3 Series computer?
3. Are special memory modules or standard SO-DIMMs required for a PowerBook G3 Series computer?
4. Can memory from the original PowerBook G3 systems that were introduced in November 1997, be used in the PowerBook G3 Series computer?

Question 1: Is it possible to add more memory to the PowerBook G3 Series computer?

Answer: Yes. There are two slots for memory on the daughter card that also houses the processor, cache, and ROM. The bottom slot is usually filled by the factory, which installs the base memory of either 32MB or 64MB. The top slot, which is accessible to the user, is open if the system comes with 64MB of memory or less; the user can install more memory in this slot.

Question 2: What is the maximum amount of memory that can be installed on a PowerBook G3 Series computer?

Answer: The system supports up to192MB of RAM using standard 64 megabit-based SO-DIMMs.

Question 3: Are special memory modules or standard SO-DIMMs required for a PowerBook G3 Series computer?

Answer: Standard SO-DIMMs can be used. We recommend choosing memory that has been tested and approved for use with the new PowerBook G3 Series. Check with the memory manufacture to verify this.

Question 4: Can memory from the original PowerBook G3 systems that were introduced in November 1997, be used in the PowerBook G3 Series computer?

Answer: No, the memory types and sizes are incompatible. But memory from the PowerBook G3 Series that was introduced in May 1998 continues to be compatible in the new configurations.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

PowerBook G3 Series: Design Elements FAQ, Part 1

This article contains PowerBook G3 Series frequently asked questions (FAQ) regarding its design elements, with answers to those questions.

For Part 2 of this article, see article 88020: "**PowerBook G3 Series: Design Elements FAQ, Part 1**"
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Why doesn't the PowerBook G3 have a reset button?
2. Why doesn't the system have a locking mechanism near the expansion or battery bay?
3. Why aren't both expansion bays the same size?
4. Is the hard disk drive removable?
5. Can you run the system with the lid closed?

These questions and answers pertain to the PowerBook G3 Series models released in September, 1998.

Question 1: Why doesn't the PowerBook G3 have a reset button?

Answer: The computer has the equivalent of a reset button using a key sequence. To do a hardware reset, press the Shift-Function-Control-Power keys simultaneously.

Question 2: Why doesn't the computer have a locking mechanism near the expansion or battery bay?

Answer: The Kensington cable lock slot on the PowerBook G3 Series is located at the back of the computer. Because there are two expansion bays, the lock slot was placed on the back, since the highest priority was to keep the base computer secure.

Question 3: Why aren't both expansion bays the same size?

Answer: The 5.25-inch expansion bay on the right side of the computer can accommodate either 5.25-inch or 3.5-inch devices. There is a small door that folds back when you insert a 5.25-inch module, such as a CD-ROM drive. The left bay can accommodate only 3.5-inch modules, such as a battery or a floppy disk drive.

Question 4: Is the hard disk drive removable?

Answer: The hard disk drive can be removed for security or servicing. You simply loosen the one screw that holds down the casing around the hard disk drive. The screw stays with the hard disk drive casing to prevent loss.

Question 5: Can the computer run with the lid closed?

Answer: You should not run the computer with the top casing or lid down, and this feature is no longer available. One of the main ways the computer cools is by allowing hot air to escape through the keyboard, and closing the lid impedes the cooling process.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Questions answered in this article:

1. How does the S-video port work on a PowerBook G3 Series computer?
2. Who makes the video controller on a PowerBook G3 Series computer?
3. Is the SGRAM (or video RAM) upgradeable on a PowerBook G3 Series computer?
4. What resolution can you use on screen on a PowerBook G3 Series computer?
5. What resolution can you use on an external monitor on a PowerBook G3 Series computer?
6. Can you use a projection device with a PowerBook G3 Series computer?
7. Can you use multiple-monitor mode with a PowerBook G3 Series computer?

Question 1: How does the S-video port work on a PowerBook G3 Series computer?

Answer: Simply plug the PowerBook into an S-video cable that attaches to your TV. If you don't have direct S-video support on your TV, you can use the S-video-to-composite cable that came with the PowerBook. Once both systems are on, you can choose the NTSC or PAL resolutions from the resolution panel in the control strip.

The 12.1-inch TFT display configuration now has an S-video port, but the 12.1-inch STN display configuration does not. Also, for optimum video quality on an 800 x 600 resolution display on a system with 2 MB of VRAM, the bit depth should be set to thousands of colors.

Question 2: Who makes the video controller on a PowerBook G3 Series computer?

Answer: The new 14-inch PowerBook G3 uses the ATI RAGE LT Pro video controller for 2D/3D graphics acceleration. This is the mobile version of the same controller used in our desktop line.

Question 3: Is the SGRAM (or video RAM) upgradeable on a PowerBook G3 Series computer?

Answer: No, the SGRAM is soldered onto the logic board, not socketed. The 12.1-inch STN configurations have 2MB of SGRAM, and the 14.1-inch TFT systems have 4MB of SGRAM.

Question 4: What resolution can you use on screen with a PowerBook G3 Series computer?

Answer: The table below lists the possibilities.

Configuration	Display		
	12.1-inch TFT (active matrix) Display	**12.1-inch STN SVGA Display**	**14.1-inch TFT XGA Display**
233/no cache, 250, or 292	Will support scaling 640 x 480 but the standard is still 800 x 600 so you can only simulscan at 800 x 600.	You can use 800 x 600 pixel resolution up to thousands of colors.	Displays at 1,024 x 768 pixel resolution up to a palette of millions of colors.

233 w/cache, 266, or 300	Will support scaling 640 x 480 but the standard is still 800 x 600 so you can only simulscan at 800 x 600.	Options for scaled resolutions of the internal display are 640 x 480 and 800 x 600. Although it can support these resolutions on the internal display, the simulscan option is available only at the standard resolution of 800 x 600.	Options for scaled resolutions of the internal display are 640 x 480 and 800 x 600. Although it can support these resolutions on the internal display, the simulscan option is available only at the standard resolution of 1024 x 768.

Question 5: What resolution can you use on an external monitor with a PowerBook G3 Series computer?

Answer: Depending on the monitor and the amount of SGRAM (video memory), you can use all the way up to 1,280- x 1,024-pixel resolution in thousands of colors or 1152 x 870 in millions o f colors on a 20-inch monitor with 4MB of SGRAM. For the image to appear on both the internal display and the external display at the same time, the PowerBook needs to be set at its simulscan resolution--1,024 x 768 pixels for 14-inch PowerBook G3 systems, and 800 x 600 pixels for 12-inch STN PowerBook G3 systems.

Question 6: Can you use a projection device with a PowerBook G3 Series computer?

Answer: Yes, you can attach a projection device to the new PowerBook G3 computers through the video output port on the back plane.

Question 7: Can you use multiple-monitor mode with a PowerBook G3 Series computer?

Answer: You can use multiple-monitor or extended-desktop mode with a Road Rocket CardBus card from IXMICRO. This card can be connected to an external monitor or projection device.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Questions answered in this article:

1. Is the PowerBook G3 Series computer's Ethernet on the main logic board or on a card, as in the PowerBook 3400?
2. Who makes the modem for the PowerBook G3 Series computer?
3. Can the modem for the PowerBook G3 Series computer be upgraded to the new v.90 standard?
4. How fast is the modem on the PowerBook G3 Series computer?
5. Does any fax software come with the PowerBook G3 Series computer?
6. Does the PowerBook G3 Series computer's modem have protection against PBX systems?
7. Can you use a cellular phone with the PowerBook G3 Series computer's modem?
8. Does the PowerBook G3 Series computer's modem work internationally?
9. Does the PowerBook G3 Series computer have infrared capability?

Question 1: Is the PowerBook G3 Series computer's Ethernet on the main logic board or on a card, as in the PowerBook 3400?

Answer: Yes, 10BASE-T Ethernet capabilities come from a chip on the main logic board. The K56flex/v.90 modem is on a separate card.

Question 2: Who makes the modem for the PowerBook G3 Series computer?

Answer: We do not reveal the names of our commodities vendors.

Question 3: Can the modem for the PowerBook G3 Series computer be upgraded to the new v.90 standard?

Answer: The modem comes with v.90 capability already installed.

Question 4: How fast is the modem on the PowerBook G3 Series computer?

Answer: The modem is a K56flex modem and will connect to equivalent devices at rates up to 56 Kbps. (Data speeds up to 56 Kbps, fax speeds up to 14.4 Kbps. Acutal download speeds vary with line conditions and your Internet service provider's modem capabilities. FCC regulations limit ISP transmission speeds to 53Kbps in the U.S.)

Question 5: Does any fax software come with the PowerBook G3 Series computer?

Answer: We bundle FAXstf software with all of our systems. This software allows you to use your PowerBook to send and receive faxes.

Question 6: Does the PowerBook G3 Series computer's modem have protection against PBX systems?

Answer: Yes, it does have protection. However, we advise customers to ask about the connection before plugging the modem into an unfamiliar socket.

Question 7: Can you use a cellular phone with the PowerBook G3 Series computer's modem?

Answer: No, the modem is not capable of attaching to cellular phones. However, if customers need a modem with cellular attachment capability, they can purchase a PC Card modem to use in the CardBus/PC Card slots on the PowerBook G3 Series.

Question 8: Does the PowerBook G3 Series computer's modem work internationally?

Answer: Due to certification requirements in different countries, there are unique internal modems for various countries. Each modem is only certified for use in that specific country. See your manual under Communications Regulation Information, or the certifications listed on the computer to see if your PowerBook is certified for use in the country you are travelling to. If you need a modem that has been certified for every country, you can purchase a PC Card modem to use in the CardBus/PC Card slot on the PowerBook G3 and PowerBook G3 Series computers.

Question 9: Does the PowerBook G3 Series computer have infrared capability?

Answer: Yes, it has 4-Mbps IrDA capabilities.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

SNMP: Load OT at System Startup time

I've installed the SNMP (Simple Network Management Protocol) agent that ships with Mac OS 8.5, but when I try to access the workstation from my console, I get the message "unreachable via SNMP". I've verified that TCP/IP is working on my computer. What else could be wrong? Is this a known issue with OT/SNMP?
This article has been archived and is no longer updated by Apple.
Background: SNMP is a network management protocol that allows a console to collect and analyze data from agents on the network. Mac OS 8.5 includes SNMP agent software that will allow Macintosh workstations to report information to third-party consoles using SNMP.

To run SNMP agent software on a Macintosh, you must initialize the TCP/IP at system startup time for the software to load and for your computer to respond to SNMP queries. On any workstation running the SNMP agent software:

1. Open the TCP/IP control panel.
2. Go into "Advanced" mode (using Command-U to bring up the User-level dialog window, select "Advanced" radio button. Click OK).
3. Click "Options" button.
4. Deselect the "Load only when needed" option; this will cause TCP/IP to initialize at system startup time.
5. Restart the workstation.

Upon restart, the workstation should be listening for SNMP communications. SNMP uses ports 161 and 162.

Mac OS: Desktop Printing Icons Change To Display Status

I have desktop printing installed on my computer. I notice that sometimes the icon for my printer changes. Can you tell me why? What do the different icons mean?

This article has been archived and is no longer updated by Apple.

Desktop printer icons show the status of the printer. Using a LaserWriter printer as an example, here are what the various desktop printer icons mean.

- **Plain** icon indicates a printer that is not currently chosen for printing.
- **Default** icon indicates the printer you have currently chosen to print on.
- **Printing** icon indicates a document is printing on this printer.
- **Stopped** icon indicates you have stopped the print queue.
- **Error** icon indicates there is an error on this printer. Double-click the icon to see a message.
- **Disabled** icon indicates this desktop printer is not available.

You can rename desktop printer icons, make aliases of them, and throw them away, just like other Finder icons.

Note: You can't throw away a desktop printer icon while the printer is printing a document.

If you throw away the icon for the default printer, another desktop printer is automatically selected as the default printer. If you do not have another desktop printer another icon is automatically created for the desktop printer you are throwing away. To throw away the last desktop printer icon, you must select a printer in the Chooser that does not support desktop printing.

AppleShare IP 6: SMB Logon Behavior

This article discusses the AppleShare IP 6 (ASIP) logon behavior for Windows File Sharing (SMB) clients.
This article has been archived and is no longer updated by Apple.
The logon behavior for Windows File Sharing (SMB) clients is different from the logon behavior for AppleShare clients. The following discusses the behavior for connecting via SMB:

Guest access disabled

ASIP will require a valid user name and password for the user to be given access.

- If the user name and/or password is invalid, access is denied.
- If the account is disabled, access is denied.

Behavior varies from client to client if access is denied. For example,

- Windows 95: allows password reentry.
- Windows 98: allows password reentry.
- Windows NT 4.0: allows user name and password reentry.

Guest access enabled

ASIP will determine the access level based on the following criteria:

- If the user name and password are valid, it will log the user on with user privileges.
- If the user name is valid but the password is incorrect, it will log the user on as guest.
- If the user name is not valid, it will log the user on as guest.
- If the account is disabled, it will log on the user as guest.

AppleShare IP 6.0: Read Me

This article contains the Read Me document for AppleShare IP 6.0.

This article has been archived and is no longer updated by Apple.

CONTENTS

Introduction
Installation and Documentation
Requirements for Running AppleShare IP 6
Support
Late Breaking Information
Known Incompatibilities and Limitations

Introduction

AppleShare IP 6 is a complete set of LAN and Internet services - including everything you need to set up Web, File, Mail, and Print servers, as well as FTP. New for version 6, AppleShare IP now provides built-in support for Windows file sharing and the AppleShare IP Mail Server now supports the Internet standard IMAPv4 protocol. Support for these open standards means that AppleShare IP is fully compatible with Macintosh and Windows clients. A single administration console makes it simple to manage AppleShare users, groups, passwords and security, retaining the hallmark ease of use which makes AppleShare IP the easiest server operating system available.

Installation and Documentation

Complete installation instructions are contained in the AppleShare IP 6.0 Getting Started manual. Additional help can also be found in the AppleShare Client 3.8 User's Guide, and in the AppleShare IP Help, all of which came with your AppleShare IP 6 software.

Requirements for Running AppleShare IP 6

Macintosh computers running AppleShare IP Server 6

- CPU: Any Apple Power Macintosh computer or Macintosh Server with a PowerPC(TM) G3, 604e, 604, 603e 6500 series, or 601 microprocessor.
- RAM: 48 MB of memory with virtual memory turned on; 64 MB with virtual memory turned off. More memory may be needed if you are using one or more web server plug-ins.
- System Software: MacOS 8.1 is required with Open Transport 1.3 or later and OpenDoc 1.2.1 or later.

Macintosh computers running AppleShare Client 3.8

- System Software: MacOS 8.1 or later with Open Transport 1.3 or later is recommended. The minimum requirement is MacOS 7.6 or later with Open Transport 1.1.2 or later.

Support

Telephone Support

- In the United States, if you have questions about AppleShare IP 6 that are not answered by the AppleShare IP Getting Started Manual or AppleShare IP Help, call the Apple Assistance Center at 1-800-APL-CARE (1-800-275-2273) during telephone support hours (Monday through Friday, 6 am to 6 pm Pacific time). When prompted, enter the support access number provided on the back of your Apple Support Card and follow the instructions.
- If you are located outside of the United States, refer to the support information that came with your AppleShare IP 6 software for instructions.

Web Sites

- If you have an Internet connection, check the Apple Support Web site at http://www.apple.com/support. For recent downloads, refer to the Apple Downloads page at http://www.apple.com/support/downloads/ and search AppleShare IP.

Late Breaking Information

- The AppleShare IP 6 Web & File Server will automatically adjust the configuration of the server according to the amount of memory

available. When 12MB or less of memory is available to the AppleShare IP Web & File Server, the server will configure itself in standard mode, similar to AppleShare IP 5.x. When there is more than 12MB of additional free memory available at the time the server launches, the AppleShare IP Web & File Server configures itself in high performance mode, at the cost of an extra 3MB of memory. High performance mode provides greater performance and scalability through an increased number of internal buffers, larger buffer sizes, a maximum concurrent connection limit for file services of 500, and a maximum concurrent connection limit for web server requests of 150.

- The AppleShare IP 6 Web & File Server now supports up to 500 concurrent file server connections, subject to the limits of the underlying hardware and operating system software. The maximum number of connections supported with AppleShare over AppleTalk is still 250. To support 500 concurrent file server connections, the remaining connections must be made over TCP. Apple recommends that you have a G3 based computer and 128MB of RAM or more if you are connecting more than 250 users.
- The AppleShare IP Mail Server documentation refers to settings available when modifying the default host settings. One of the settings available is the ability to turn ETRN (remote mail polling) on or off. This setting has been removed from the "Default Host Settings", but can be enabled or disabled on a "per-host" basis. Please review the AppleShare IP Mail documentation for further information about the remote mail polling features of AppleShare IP Mail 6.

Known Incompatibilities and Limitations

MacOS 8.1

- When sharing a CD ROM disc from a server which is running MacOS 8.1, clients may encounter errors when accessing the files on the CD. If you encounter this issue, install the Apple CD/DVD Driver that is included on the AppleShare IP 6.0 CD. See the Read Me file in the Apple CD/DVD Driver folder for more details.
  There is an issue in the MacOS Memory Manager that may cause your server to freeze or crash. A cosmetic indicator of this issue may be seen in the "About this Computer" window, where the Mac OS would appear to use 3.9 GB of memory. To avoid the issue, install the AppleShare MMgr INIT that is included on the AppleShare IP 6.0 CD. Please note that the AppleShare MMgr INIT does not fix the cosmetic indicator. See the Read Me file in the AppleShare MMgr INIT folder for more details.
- You can run AppleShare IP under light to moderate load with virtual memory turned on. For increased stability when your server needs to handle a very heavy load with hundreds of server connections, install additional memory and turn virtual memory off.

Installer

- The AppleShare IP 5.0 folder is not removed when installing AppleShare IP 6. This folder is kept for critical files you may need to update or move over to the AppleShare IP 6.0 folder.

Web & File Admin

- In low memory situations, you may encounter issues with Web & File Admin. If necessary, quit other applications. In addition, make sure that you set aside ample memory in the AppleShare IP Cache settings panel for your other applications to launch, including Web & File Admin.

Registry

- The AppleShare IP Registry will convert your Users & Groups Data File to run with AppleShare IP 6 the first time you reboot with AppleShare IP installed. Since this file will no longer work with Personal File Sharing after the conversion, a copy of the original file is placed in your Preferences folder. The file is named Users & Groups Data File Backup. The copy of the original file may be used if you decide to restore your machine to Personal File Sharing after de-installing AppleShare IP 6.

Web & File Server

- If a computer that is running the Web & File Server stops responding, check your hard disks by running Disk First Aid before you start the Web & File Server again. Disk First Aid is located in the Utilities folder on your MacOS CD ROM disc.
- The Adobe Acrobat(TM) Installer cannot be used while the Web & File Server is running. Be sure to install Adobe Acrobat before you start the Web & File Server.
- AppleShare IP 6 is not compatible with ARA Multiport Server software. You should not run them on the same computer.
- Under some circumstances you may not be able to install PC applications from Windows File Sharing Server. To perform net installations of applications that are partitioned on multiple floppy disks, create a folder 'X' and copy each disk as a separate subfolder. Then make the parent folder 'X' a share point. From the client, connect to the share point and perform the installation.
- You may experience issues with installing a Windows application from an installer residing on an AppleShare IP 6 server. The following alert

may appear: "Can not find <drive>:\\<installer filename>. Windows needs this file to run." If the name of the folder containing the installer program is more than eight characters in length (i.e. APPLICATION INSTALLER), change it to one containing eight characters or less (i.e. INSTALL). Some installer programs may also require that you spell out the drive and directory path to the folder. Please consult your application's installation instructions for information on how map a drive.

- Windows clients should Refresh from the View menu any server folder window whose access privileges have changed since their last login into server.
- Hybrid Mac/PC CDs can be shared, but not all PC files will be visible. Network installs of PC software on a hybrid CD may not work.
- Windows files and folders with names containing more than thirty-one characters will be truncated when copying them to an AppleShare IP 6 server. To avoid issues, rename the files and folders so that their names contain thirty-one characters or less.
- The Windows File Sharing service is not compatible with DAVE SMB client. To access AppleShare IP server from a Macintosh client, use AppleShare client.
- If you do not need to customize the Web Server Error files, you may remove them in order to increase Web server performance.
- Booting your AppleShare IP server with a volume whose system software has Personal File Sharing enabled erases your AppleShare IP share point and access privileges. Do not enable Personal File Sharing if you need to boot the server computer with a different volume.
- If you need to enable an additional Web & File service (such as Web, FTP, Windows File Sharing, etc) while the Web & File Server is already running and is under a heavy load, reset the cache before enabling the new service.
- The Web folder no longer needs to be shared or be inside a share point for the Web service to work.
- For an improved client compatibility, the FTP server automatically displays files that contain resource forks as "<filename>.bin".
- Under Windows File Sharing, if you share a volume that is larger than 2 Gigabytes, the bytes used and free space amounts displayed may be incorrect from Windows 95 clients (they show correctly from Windows NT clients). Ordinarily, this has no impact on using the server, but it can lead to "out of disk space" warning for large copies. If you experience this issue, share smaller volumes for Windows.

AppleShare Client 3.8

- If you have issues connecting, make sure that you can ping the server. If you can ping the server but you cannot connect, report the issue to Apple Technical Support. If you can't ping the server you have a connectivity issue.
- If the Chooser hangs when mounting volumes (after the OK button has been clicked in the volume list dialog), try disabling the Apple Menu Options control panel on the client computer.
- If a user makes an alias to an AppleShare IP volume and uses TCP to connect to that volume, both TCP/IP and AppleTalk must be active on the user's computer. Due to a limitation in the Alias Manager, AppleTalk must be active to resolve the alias.
- The Finder copy performance on mounted AppleShare volumes is slow with MacOS 8.0. Upgrade your MacOS software on your client computer to version 8.1 to improve the copy performance.
- If you have a Global Village K56 flex card modem and are using Open Transport PPP 1.0.1 to provide TCP/IP connectivity, you need to disable the menu bar status lights, or launch PPP manually and connect to your ISP, before using the Chooser to connect to an AppleShare file server over TCP/IP.
- The NetWare User Authentication Module prior to version 5.11 is incompatible with the AppleShare Client 3.8 software. Contact Novell for an update.
- The AppleShare Client 3.8 software is not compatible with versions of RunShare prior to version 3.0, and it may cause the computer to stop responding. Be sure to upgrade to RunShare version 3.0 or later before you install AppleShare Client Software 3.8.

Mail Server

- The AppleShare IP 6 Mail Server can not directly use previous versions of the AppleShare IP mail database. In order to access your existing mail messages, there are two methods available for completing the upgrade from AppleShare IP 5.0.1 or greater to AppleShare IP 6.
  Note: If you use AppleShare IP 5.0 Mail Server, you will need to use the AppleShare IP 5 Mail Tool to update the version 5.0 mail database to version 5.x prior to using AppleShare IP 6 Mail Tool.
  - Method 1:

    1. First, all users can download all existing mail from the AppleShare IP Mail Server.

    2. Verify that there is no mail waiting to be sent.

    3. After all users have downloaded all of their mail, and there is no mail waiting to be sent, you can simply "Quit" the AppleShare IP 5.0 Mail Server and run the AppleShare IP 6 Mail Server. This will create a new empty mail database and future mail data will be stored in this new mail database file.

  - Method 2: If the first option doesn't meet your needs, the AppleShare IP 6 Mail Tool can also convert existing AppleShare IP 5.0.1 or greater database files to the AppleShare IP 6 file format.

    1. This will require you to run the AppleShare IP 6.0 Mail Tool prior to starting the AppleShare IP 6 Mail Server.

    2. After running the Mail Tool, run the AppleShare IP 6 Mail Server. All delivered and outgoing mail will be converted to the

AppleShare IP 6 database format.

- The AppleShare Mail Tool cannot be used while the Mail Server is running.

Print Server

- It is recommended that a queue only contain printers of the same model and type. Also, printer features present in the first printer attached, but not present in subsequent printers, may cause print errors when jobs are printed to one of the subsequent printers.
- LPD Print Server error codes are available on the AppleShare IP 6 tutorial located in the AppleShare IP CD Tutorials folder. In addition, they are available on the Apple Support Web site at http://www.apple.com/support.
- The "Allow binary data" and "Allow color printing" options are only used with AppleTalk print queues.
- Some LPR clients cannot handle queue names that include spaces. Therefore, ASIP Print Server will also recognize the name up to the first space. For example, if the print queue name is 'Accounting Department', the queue name 'Accounting' must be used for some LPR clients.
- Windows NT printer drivers are not compatible with the secure printing feature for print queuing. Do not enable security on a print queue if Windows NT clients use it.
- With secure printing activated, a Postscript file copied or sent from one client to another for printing may not work.

Documentation

- If you are experiencing any issue while printing the PDF documents that are included on the AppleShare IP 6.0 CD, increase the memory allocated to Adobe Acrobat(TM) application by 2MB.

AppleShare IP 6.0: Mail Tool Read Me

This article contains the Read Me document for the AppleShare IP 6.0 Mail Tool.

This article has been archived and is no longer updated by Apple.

Contents

- Notes
- Tool Purpose
- Tool Requirements
- Tool Features
- Tool Questions & Answers and Troubleshooting

Notes

A prudent safety precaution would be to save/backup the original AppleShare IP Mail Database and Users & Groups file before running the AppleShare IP Mail Tool on it.

Tool Purpose

The AppleShare IP Mail Tool allows administrators to manage the AppleShare IP Mail Server database. While this database requires no management or intervention by users under normal circumstances, it is possible for the database to become unusable if the system stops responding. The AppleShare IP Mail Tool also allows reassignment of mail messages for disabled mailboxes, and can be used to update and compress existing databases. The tool will also be necessary to upgrade an existing 5.0.x Databases into 6.0 Databases that can then be used by the 6.0 Mail Server.

Tool Requirements

The 6.0 version of the AppleShare IP Mail Tool requires AppleShare IP 6.0 or later. You will also need a 5.0.x version of the Mail Database if you intend to upgrade it to a 6.0 Database.

Note: Running the Mail Tool on a very large Database file can take a long time. Running the Mail Tool using a G3 Server on a Database that was 1.5 GB took 4 hours. It would be wise to backup your Mail Database nightly to prevent a long downtime if the server happens to stop responding during the day. Just remember to backup your Users & Group File at the same time you backup your Database.

Tool Features

- Mail Database Updating

  Users of AppleShare IP 5.0.1 or later will need to upgrade their Mail Databases to be compatible with the 6.0 version of the Mail Server. Please note that the name of the Database has changed from "AppleShare IP Mail Database" for 5.0.x, into "AppleShare IP Mail 6.0 Data" for 6.0. If you use the default settings during the upgrade the tool will use the proper name for the new database. Be sure that the new database is placed inside the "AppleShare IP Mail Folder" with the correct name to complete the upgrade operation.

  Note for AppleShare IP 5.0 Users: The 6.0 version of the AppleShare IP Mail Tool will not create or modify an AppleShare IP 5.0 compatible mail database. AppleShare IP 5.0 users will need to upgrade their Mail Server and Mail Database to version 5.0.1 or later before they will be able to run the 6.0 version of the mail tool. In order to upgrade a 5.0 Database to a 5.0.x Database you will need the 5.0.2 version of the mail tool found on the AppleShare IP web site. Once you have upgraded your 5.0 Database to a 5.0.x Database you can then run the 6.0 Mail Tool to upgrade your Database so that it can be used by the 6.0 version of the Mail Server.

- Mail Database Compression and Verification

  The AppleShare IP Mail Tool offers the ability to compress, verify and/or repair an AppleShare IP Mail Database. A database may become unusable for a variety of reasons that include (but are not limited to) power failure, hardware failure, and if the system stops responding. In addition to being a database verification tool it is also sometimes useful to run the tool on mail databases since the verification removes unused free space inside the original mail database, with the potential of greatly compressing the size of a mail database which may have grown over time.

- Disabled Mailbox Reassignment

  The mail server uses a special "fingerprint" to ensure that a user's mailbox in the mail database matches the correct user record in the current

AppleShare IP Users & Groups. The fingerprint is a unique number that is stored in both the user's record and the user's mailbox in the AppleShare IP Mail Database.

The mail server checks for fingerprint mismatches each time it starts up. When it finds a mailbox in the AppleShare IP Mail Database whose fingerprint does not match the fingerprint of a user in the currently active Users & Groups file the server disables that mailbox. No mail is deleted from the disabled mailbox, however, the mailbox in inaccessible to a user trying to login under that account. To retrieve mail from a disabled mailbox, use the AppleShare IP Mail Tool to assign the disabled mailbox to a valid user in the AppleShare IP Users & Groups file.

You can prevent mailbox mismatch problems by taking these precautions:

- Treat the Users & Groups file and the AppleShare IP Mail Database as a set. Always back up and restore them together. If you were to restore the AppleShare IP Users & Groups file without also restoring the mail database, the mail server could disable mailboxes that have no matching user in the current Users & Groups file. If you must restore the Users & Groups file, make sure that all current users have retrieved their mail first (if possible). Then restore the Users & Groups file and the mail database from the same backup. Alternatively, you can restore the Users & Groups file, start the mail server, note the mailboxes that are disabled, and use the AppleShare IP Mail Tool to assign the disabled mailboxes to valid users.
- If you move the AppleShare IP Mail Database to another computer, move the AppleShare IP Users & Groups file also. If you were to move the AppleShare IP mail database to another computer without moving the Users & Groups file, the mail server would disable most if not all mailboxes and create new, empty mailboxes for all users in the Users & Groups file for whom mail is enabled. Note that moving the Users & Groups file to another computer that is running the Web & File Server will cause any access privileges that have been assigned on that computer to be lost because the access privileges no longer match the Users & Group File.
- When you delete users for whom mail is enabled, make sure the AppleShare IP Mail Server is running. If the mail server is not running when you delete users for whom mail is enabled, the next time the mail server starts up, it will report that each deleted users' mailbox does not have a matching entry and it will disable their mailboxes.

Note: It is always safe to throw away a mail database that is empty (as indicated by a zero in the "Number of Messages" field in the mail server Activity window). When you restart the mail server, it will create a mailbox for each user in the AppleShare IP Users & Groups file for which the Enable Mail radio button is selected.

Tool Questions & Answers and Troubleshooting

Question:

What is the "Indexes" folder that is inside the Mail Database Folder?
Answer:

That folder is used by the V-Twin search engine that is a part of the Mail Server. It stores temporary files used to index mail messages for quick searching. It can be thrown away and will be recreated when a user issues a new search of their mailbox. The folder should be backed up along with the Mail Database in order to speed up search operations, but you are not required to do so.

Question:

How do I export mail that is in a user's mailbox to a text file?
Answer:

The 5.0.2 version of the mail tool had a button that did this operation, but that button has been removed for the 6.0 Mail Tool. This functionality has been moved over to the IMAP Admin port. In order to export a user's mailbox, you log into the mail server via the IMAP Admin port using any IMAP client. Then you rename the mail folder that you would like to export with the suffix of ".xdump". (For example, a folder named "Accounting" would be renamed to "Accounting.xdump") All the mail in this folder will appear in a text file that is created inside the AppleShare IP Mail Folder.

Question:

What else does the tool scavenge out of the old Mail Database besides email?
Answer:

The Mail Server stores server and host preferences inside the Mail Database. After running the tool you will not have to re-enter your server and host settings.

Question:

Can I AppleScript the AppleShare IP Mail Tool to compress the AppleShare IP Mail Database before making a backup with my normal backup software?
Answer:

No. The AppleShare IP Mail Tool does not support AppleScript. We are evaluating adding AppleScript support to a future version.

Question:

Can I run the AppleShare IP Mail Tool while the Mail Server and Mail Admin are running?
Answer:

No. The Mail Server and Admin must be shutdown for the AppleShare IP Mail Tool to function.

Question:

I've noticed in the AppleShare IP Reassignment screen that some entries in the User's list are in italics, and I can't click on these users. Why is that?
Answer:

The AppleShare IP Mail Tool only allows the selection of users that have no mail in their accounts, or are not enabled for Mail. Users who are enabled for mail and have 1 or more messages in their Mailboxes can not be a target for reassignment. These users are shown in italic in the list to indicate their non-selectable status.

Question:

Can I Reassign disabled Mailboxes and continue to use AppleShare IP Mail 5.0.x?
Answer:

No. The AppleShare IP Mail Tool only supports account reassignment for 6.0 Mail Databases. If you have to reassign accounts in a Mail 5.0.x Database you will first need to "update" the Mail Database file using the AppleShare IP Mail Tool.

Question:

Do I have to reassign all the disabled mailboxes in an AppleShare IP Mail Database?
Answer:

No. The AppleShare IP Mail Tool supports the direct deletion of disabled mailboxes. This feature is useful for clearing out the mail of a user whose account record has been deleted from the Users & Groups file.

Question:

Can I run the AppleShare IP Mail Tool on a different computer than where the mail server runs?
Answer:

Yes, but it is not recommended. While the AppleShare IP Mail Tool is reassigning accounts or updating/repairing a Mail Database, it uses and updates user-mail information present in the Users & Groups file on the server. It is best if you use the tool on the computer with the same Users & Groups file as the database originally used.

Question:

After running the AppleShare IP Mail Tool I've noticed that the resulting mail database file is much smaller than the original file. Does this mean I have lost mail?
Answer:

No. In the normal day to day use of the mail server it can occasionally grow the mail database file to a large size to accommodate large messages and/or a large number of smaller messages. Over time this space is released and the mail server then reuses space inside the file. When running the AppleShare IP Mail Tool a new copy of all the information present in the original file is created. Many times the space requirements of this information are far less than the maximum file size represented by the old database.

Question:

After running the tool, some of my users received duplicates of some messages that they had already downloaded and deleted. Is this expected?
Answer:

Yes. Depending on when, where, and how bad the damage is to an AppleShare IP Mail Database it is sometimes difficult for the tool to determine if the message was actually deleted by the user. In cases like this the ASIP Mail Tool errors on the side of caution, and will post a copy of a message with an ambiguous deletion state. This can lead to message duplicates for mail that users have already received. We apologize for these messages, but felt that this was better than risking the loss of mail that wasn't actually deleted by the user.

Question:

The AppleShare IP Mail Tool makes a copy of my users and groups file. Why is this?
Answer:

TA21937_AppleShare_IP_Mail_Tool_Read_Me.pdf

The AppleShare IP Mail Database tool needs to modify the fingerprints of users inside the Users & Groups file while performing: verification, compression, or an upgrade of an existing AppleShare IP Mail Database. After the AppleShare IP Mail Tool updates the fingerprints, the old AppleShare IP Mail database file will no longer match the updated user fingerprints. Therefore as a safety measure the AppleShare IP Mail Tool makes a copy of the User & Groups data before any modifications are performed. This gives an AppleShare IP Administrator the option to revert to an old AppleShare IP Mail Database file (if necessary) and still use the old Mail Database file, rather than the newly created AppleShare IP Mail Database.

Question:

I pressed the cancel button during a Mail Database compression operation. Does this mean I have to restore the Users & Groups file in order to use my preexisting AppleShare IP Mail database file?
Answer:

No. The last step in the verification the AppleShare IP Mail Tool performs is the update of the fingerprints in the current Users & Groups file. And while the tool is updating the fingerprints the "cancel" button is disabled. This operation is normally so fast that unless your Users & Groups file has thousands of users it will be virtually instant (and even then it only takes a few seconds). During verification, the old Mail Database is moved into a backup folder for safe keeping. This folder is also where the Users & Groups file copy is placed. If the Users & Groups file copy is absent from this folder, then the existing mail database file is usable with out the need to restore the Users & Groups file.

Question:

What is the worst that can happen if I don't restore the Users & Groups data file; but after running the AppleShare IP Mail Tool I choose to reuse the old mail database rather than the new mail database?
Answer:

Good question. First issue: NO mail will be lost as a result of using an old AppleShare IP Mail database after running the tool. If you choose to re-use an older AppleShare IP Mail database after running the AppleShare IP Mail Tool (instead of using the new database file). When the AppleShare IP Mail server is run for the first time, it will most likely disable all mailboxes found in the old mail database (since the old mailboxes don't match the current fingerprints in the Users & Groups file). This then requires that you quit the Mail Server, run the AppleShare IP Mail Tool and reassign the disabled mailboxes. After reassigning the mailboxes, launching the AppleShare IP Mail server will work fine, and all users will have access to all of their mail.

Question:

Wow, the previous two answers sound complicated, how do I avoid all this?
Answer:

The above situation is only applicable if you've run the AppleShare IP Mail Tool, created a New AppleShare IP Mail Database (as the result of a compress, verify, or upgrade function); and after running the tool you wish to continue using the old AppleShare IP Mail database file. The universal rule is that when using an older copy of an AppleShare IP Mail database you have to also restore the Users & Groups file, otherwise you risk disabling mailboxes when you launch AppleShare IP Mail Server.

Microsoft Internet Explorer: Configuring For MacBinary

If not set up correctly, Microsoft Internet Explorer may experience difficulty downloading and expanding MacBinary formatted files.
This article has been archived and is no longer updated by Apple.
If you experience difficulties with downloading Macbinary files using Microsoft Internet Explorer, be sure you have Stuffit Expander selected in the File Helpers of your Internet Explorer Preferences.

To make sure that this is the setting, perform the following procedure:

1. Open Internet Explorer.
2. Choose Preferences from the the Edit menu; the Preferences window appears.
3. In the Preferences window, locate the preference item"Receiving Files" and select "File Helpers". A list of File Helper settings should appear on the right side of the Preferences window.
4. Scroll down the list until you find the entry labeled "MacBinary". Select that entry and click on the "Change" button.
5. In the "Edit File Helper" dialog that appears (see Figure 1 below), click the Browse button and select the "Stuffit Expander" application from the hard disk.
6. Click OK in the "Edit File Helper" dialog.
7. Click OK in the "Internet Explorer Preferences" dialog to save this change.

Figure 1 The Edit File Helper dialog

This enables Internet Explorer to successfully download, identify, and expand MacBinary formatted files regardless of the content of the file name.

If the file does not successfully expand on its own after the download is complete, try double-clicking on the downloaded file to open Stuffit Expander. Alternatively, drag the downloaded file and drop it on Stuffit Expander to convert the file.

For more information on the MacBinary file format and downloading, please see the following Knowledge Base articles:

Safety Instructions: Read Me Document

This article contains the "Safety Instructions and Regulatory Agency Information" document included with many Apple products.
This article has been archived and is no longer updated by Apple.
Important Safety Instructions and Regulatory Agency Information

Safety Instructions for Setting Up Your Computer

When you set up your computer or device, keep these important safety instructions in mind:

Plugging In the Power Cord

Important Your computer or device has a three-wire grounding plug that will fit only a grounded AC outlet. If you are unable to insert the plug in the outlet, contact a licensed electrician to replace the outlet with a properly grounded outlet.

Important The plug on the power cord must be completely inserted into the computer's power socket and firmly seated for your computer to operate correctly.

Connecting a Phone Line to the Modem Port

Important Make sure you connect the modem to an analog phone line, the kind typically used in homes.

Turning On the Computer Using the Power Button on the Computer or Keyboard

Important The only way to completely disconnect power from the computer is to unplug the power cord from the outlet or from the back of the computer.

General Safety Instructions

For your own safety and that of your equipment, always take the following precautions. Disconnect the power plug (by pulling the plug, not the cord) if any of the following conditions exists:

- you want to remove any parts (leave the cord disconnected as long as the cover is off)
- the power cord or plug becomes frayed or otherwise damaged
- you spill something into the case
- your computer or device is exposed to rain or any other excess moisture
- your computer or device has been dropped or the case has been otherwise damaged
- you suspect that your computer or device needs service or repair
- you want to clean the case (use only the recommended procedure described later)

Be sure that you always do the following:

- Keep your computer or device away from sources of liquids, such as washbasins, bathtubs, shower stalls, and so on.
- Protect your computer or device from dampness or wet weather, such as rain, snow, and so on.
- Read all the installation instructions carefully before you plug your computer or device into a wall socket.
- Keep these instructions handy for reference by you and others.
- Follow all instructions and warnings dealing with your system.

Warning Electrical equipment may be hazardous if misused. Operation of this product, or similar products, must always be supervised by an adult. Do not allow children access to the interior of any electrical product and do not permit them to handle any cables.

To clean the case, do the following:

1. Disconnect the power plug. (Pull the plug, not the cord.)
2. Wipe the surfaces lightly with a clean, soft cloth dampened with water.

Warning Never push objects of any kind into this product through the openings in the case. Doing so can cause a fire or a dangerous electric shock.

Communications Regulation Information

FCC Compliance Statement

This device complies with part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation. See instructions if interference to radio or television reception is suspected.

Radio and Television Interference
The equipment described in this manual generates, uses, and can radiate radio-frequency energy. If it is not installed and used properly--that is, in strict accordance with Apple's instructions-it may cause interference with radio and television reception.

This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in Part 15 of FCC rules. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

You can determine whether your computer system is causing interference by turning it off. If the interference stops, it was probably caused by the computer or one of the peripheral devices.

If your computer system does cause interference to radio or television reception, try to correct the interference by using one or more of the following measures:

- Turn the television or radio antenna until the interference stops.
- Move the computer to one side or the other of the television or radio.
- Move the computer farther away from the television or radio.
- Plug the computer into an outlet that is on a different circuit from the television or radio. (That is, make certain the computer and the television or radio are on circuits controlled by different circuit breakers or fuses.)

If necessary, consult an Apple-authorized service provider or Apple. See the service and support information that came with your Apple product. Or, consult an experienced radio/television technician for additional suggestions.

Important Changes or modifications to this product not authorized by Apple Computer, Inc., could void the FCC Compliance and negate your authority to operate the product.

This product was tested for FCC compliance under conditions that included the use of Apple peripheral devices and Apple shielded cables and connectors between system components. It is important that you use Apple peripheral devices and shielded cables and connectors between system components to reduce the possibility of causing interference to radios, television sets, and other electronic devices. You can obtain Apple peripheral devices and the proper shielded cables and connectors through an Apple-authorized dealer. For non-Apple peripheral devices, contact the manufacturer or dealer for assistance.

Responsible party (contact for FCC matters only): Robert Steinfeld, Apple Computer, Inc., 1 Infinite Loop, Cupertino, CA 95014-2084, 408-974-2618.

Industry Canada Statement
This Class B device meets all requirements of the Canadian interference-causing equipment regulations. Cet appareil numÃ©rique de la Classe B respecte toutes les exigences du RÃ¨glement sur le matÃ©riel brouilleur du Canada.

VCCI Class B Statement

Warning Making adjustments or performing procedures other than those specified in your equipment's manual may result in hazardous radiation exposure.

Do not attempt to disassemble the cabinet containing the laser. The laser beam used in this product is harmful to the eyes. The use of optical instruments, such as magnifying lenses, with this product increases the potential hazard to your eyes. For your safety, have this equipment serviced only by an Apple-authorized service provider.

If you have an internal Apple CD-ROM drive in your computer, your computer is a Class 1 laser product. The Class 1 label, located in a user-accessible area, indicates that the drive meets minimum safety requirements. A service warning label is located in a service-accessible area. The labels on your product may differ slightly from the ones shown here.

Figure 1 Class 1 label

Figure 2 Service warning label

High-Risk Activities Warning
This computer system is not intended for use in the operation of nuclear facilities, aircraft navigation or communications systems, or air traffic control machines, or for any other uses where the failure of the computer system could lead to death, personal injury or severe environmental damage.

Telephone and Modem Information
Your computer may contain an optional internal modem. Some telephone companies require that you notify the local business office when you hook up a modem to their lines.

Information You Need in the United States
The internal modem complies with Part 68 of the FCC rules. On the back of this equipment is a label that contains, among other information, the FCC registration number and ringer equivalence number (REN). If requested, provide this information to your telephone company.

- Ringer equivalence number (REN): 0.8 The REN is useful to determine the quantity of devices you may connect to your telephone lines and still have all those devices ring when your telephone number is called. In most, but not all areas, the sum of the RENs of all devices connected to one line should not exceed five (5.0). To be certain of the number of devices you may connect to your line, as determined by the REN, you should contact your local telephone company to determine the maximum REN for your calling area.
- Telephone jack type: USOC, RJ-11 An FCC-compliant telephone cord and modular plug are provided with this equipment. This equipment is designed to be connected to the telephone network or premises wiring using a compatible modular jack that complies with Part 68 rules. See the installation instructions for details.

Telephone Line Problems
If your telephone doesn't work, there may be a problem with your telephone line. Disconnect the modem to see if the problem goes away. If it doesn't, report the problem either to your local telephone company or to your company's telecommunications people.

If disconnecting the modem eliminates the problem, the modem itself may need service. See the service and support information that came with your Apple product for instructions on how to contact Apple or an Apple-authorized service provider for assistance.

If you do not disconnect your modem when it is adversely affecting the telephone line, the telephone company has the right to disconnect your service temporarily until you correct the problem. The telephone company will notify you as soon as possible. Also, you will be informed of your right to file a complaint with the FCC.

The telephone company may make changes in its facilities, equipment, operations, or procedures that could affect the operation of your equipment. If this happens, the telephone company will provide advance notice in order for you to make the necessary modifications to maintain uninterrupted service.

The internal modem will not work with party lines, cannot be connected to a coin-operated telephone, and may not work with a private branch exchange (PBX).

Telephone Consumer Protection Act
The Telephone Consumer Protection Act of 1991 makes it unlawful for any person to use a computer or other electronic device to send any message via a telephone fax machine unless such message clearly contains in a margin at the top or bottom of each transmitted page or on the first page of the transmission, the date and time it was sent and an identification of the business or other entity, or individual sending the message and the telephone number of the sending machine of such business, entity, or individual.

Information You Need in Canada
The Industry Canada (IC) label identifies certified equipment. This certification means that the equipment meets certain telecommunications network protective, operational, and safety requirements. The Department does not guarantee the equipment will operate to a user's satisfaction.

Before installing this equipment, make sure that you are permitted to connect to the facilities of the local telecommunications company. Be sure you use an acceptable method of connection to install the equipment. In some cases, you may extend the company's internal wiring for single-line individual service by means of a certified telephone extension cord. Be aware, however, that compliance with these conditions may not prevent degradation of service in some situations.

Repairs to certified equipment should be made by an authorized Canadian maintenance facility designated by the supplier. Any equipment malfunctions or repairs or alterations that you make to this equipment may cause the telecommunications company to request that you disconnect the equipment.

In Canada, contact Apple at: 7495 Birchmount Road, Markham, Ontario, L3R 5G2, 800-263-3394

Users should ensure for their own protection that the electrical ground connections of the power utility, telephone lines, and internal metallic water pipe system, if present, are connected together. This precaution may be particularly important in rural areas.

Warning Users should not attempt to make such connections themselves, but should contact the appropriate electric inspection authority or electrician.

- Load number: 0.3 The load number (LN) assigned to each terminal device denotes the percentage of the total load to be connected to the telephone loop that is used by the device, to prevent overloading. The termination of a loop may consist of any combination of devices, subject only to the requirement that the sum of the load numbers of all devices does not exceed 100.
- Telephone jack type: CA-11

Informations destinÃ©es aux utilisateurs canadiens
L'Ã©tiquette d'Industrie Canada identifie un matÃ©riel homologuÃ©. Cette Ã©tiquette certifie que le matÃ©riel est conforme Ã certaines normes de protection, d'exploitation et de sÃ©curitÃ© des rÃ©seaux de tÃ©lÃ©communications. Le MinistÃ¨re n'assure toutefois pas que le matÃ©riel fonctionnera Ã la satisfaction de l'utilisateur.

Avant d'installer ce matÃ©riel, l'utilisateur doit s'assurer qu'il est permis de le raccorder au rÃ©seau de l'entreprise locale de tÃ©lÃ©communication. Le matÃ©riel doit Ã©galement Ãªtre installÃ© en suivant une mÃ©thode acceptÃ©e de raccordement. Dans certains cas, le cÃ¢blage appartenant Ã l'entreprise utilisÃ© pour un service individuel Ã ligne unique peut Ãªtre prolongÃ© au moyen d'un dispositif homologuÃ© de raccordement (cordon prolongateur tÃ©lÃ©phonique).

L'abonnÃ© ne doit pas oublier qu'il est possible que la conformitÃ© aux conditions Ã©noncÃ©es ci-dessus n'empÃªche pas la dÃ©gradation du service dans certaines situations. De fait, les entreprises de tÃ©lÃ©communication ne permettent pas que l'on raccorde un matÃ©riel aux prises d'abonnÃ©s, sauf dans les cas prÃ©cis prÃ©vus par les tarifs particuliers de ces entreprises.

Les rÃ©parations de matÃ©riel homologuÃ© doivent Ãªtre effectuÃ©es par un centre d'entretien canadien autorisÃ© dÃ©signÃ© par le fournisseur. La compagnie de tÃ©lÃ©communications peut demander Ã l'utilisateur de dÃ©brancher un appareil suite Ã des rÃ©parations ou Ã des modifications effectuÃ©es par l'utilisateur ou en raison d'un mauvais fonctionnement.

Veuillez contacter Apple pour des informations supplÃ©mentaires :
Apple Canada, Inc.
7495 Birchmount Road
Markham, Ontario
Canada L3R 5G2
Service Ã la clientÃ¨le d'Apple Canada: 800-263-3394

Pour sa propre protection, l'utilisateur doit s'assurer que tous les fils de mise Ã la terre du secteur, des lignes tÃ©lÃ©phoniques et les canalisations d'eau mÃ©talliques, s'il y en a, soient raccordÃ©s ensemble. Cette prÃ©caution est particuliÃ¨rement importante dans les rÃ©gions rurales.

Avertissement L'utilisateur ne doit pas tenter de faire ces raccordements lui-mÃªme; il doit avoir recours Ã un service d'inspection des installations Ã©lectriques ou Ã un Ã©lectricien, selon le cas.

- NumÃ©ro de charge : 0,3 L'indice de charge (IC) assignÃ© Ã chaque dispositif terminal indique, pour Ã©viter toute surcharge, le pourcentage de la charge totale qui sera raccordÃ©e Ã un circuit tÃ©lÃ©phonique bouclÃ© utilisÃ© par ce dispositif. La terminaison du circuit bouclÃ© peut Ãªtre constituÃ©e de n'importe quelle combinaison de dispositifs pourvu que la somme des indices de charge de l'ensemble des dispositifs ne dÃ©passe pas 100.
- Type de prise tÃ©lÃ©phonique : CA-11

Information You Need in the United Kingdom
This terminal equipment is intended for direct connection to the analogue Public Switched Telecommunications Network and is approved for use within the United Kingdom with the following features:

- Modem facility
- Autocalling facility
- Autoanswer facility
- DTMF signaling
- Operation in the absence of proceed indication or upon detection of proceed indication

This product is in conformity with relevant regulatory standards following the provisions of European Council Directives 73/23/EEC (Low Voltage Directive) and 89/336/EEC amended by 92/31/EEC (EMC Directive).

Information You Need in Germany
Diese Modem-Karte ist als Endeinrichtung vorgesehen und muss an ein TAE mit F-Kodierung angeschlossen werden.

Diese Endeinrichtung ist in KonformitÃ¤t gemÃ¤ss Niederspannungsrichtlinie 73 / 23 / EWG sowie EMC-Richtlinien 89 / 336 / EWG und 92 / 31 / EWG.

Information You Need in France
Ce matÃ©riel est conforme aux normes applicables de sÃ©curitÃ© Ã©lÃ©ctrique d'aprÃ¨s la directive 73 / 23 / CEE et aux normes applicables de comptabilitÃ© Ã©lÃ©ctromagnÃ©tique d'aprÃ¨s la directive 89 / 336 / CEE, modifiÃ© par la directive 92 / 31 / CEE.

Mouse Information
This product complies with the requirements of European Directives 72/23/EEC and 89/336/EEC.
Complies with the Canadian ICES-003 Class B Specification.

Mac OS X Server: Mounting A CD-ROM Disc In Single User Mode

This article is about mounting a CD-ROM disc in single user mode.
This article has been archived and is no longer updated by Apple.
Mounting a CD-ROM disc in single user mode can be a little tricky.

1. Start up into single user mode by holding down the "s" key during startup with the disc in the CD-ROM drive. When you reach the # prompt the startup is complete.

2. In order to mount the CD you must determine the device number that Mac OS X Server has assigned to it during startup. There are two possible types of CD-ROM drives: IDE and SCSI. This information is listed while you are starting up into single user mode. Scan the lines of information for "CD-ROM". At the beginning of this line you will see the letters "sd" followed by a number, for example "sd2." This is the device number that Mac OS X Server has assigned to your CD-ROM drive.

3. The next step in mounting your disc is to determine on which slice (partition) the UFS (UNIX file system) information is stored. For example, the UFS slice on the Mac OS X Server Installation disc is on slice a. Other CD-ROMs may vary. To determine which slice your information is on, try mounting slices (a, b, c, etc), or contact the disc's manufacturer.

4. Lastly, you will need a place to mount the disc. You can mount the disc at any directory (mount point). The /tmp directory is usually a good one, or you can create a /mnt directory using the mkdir command.
Example: To mount the Mac OS X Server Installation disc to directory /mnt, use the following command from the single user mode prompt:

```
mount /dev/sd2a /mnt
```

The /dev/sd2a directory structure is used because the /dev directory is where information about that device is stored. The /dev directory has many devices already entered. You probably will not need to add any.

Mac OS: Finder Lists Are In Reverse Order

When I look at some windows in the Finder, the items listed are not in alphabetical order. They are in reverse alphabetical or some other unrecognizable order. Can you explain?

This article has been archived and is no longer updated by Apple.
Starting with Mac OS 8.1, there is an option to reverse the order of any Finder window in list view. There is an icon on the upper right side of the window that looks like a pyramid made out of lines (see Figure 1 below).

Figure 1: Sort Order icon

If you click on it, it will reverse the order of the window. The exact order depends on how the window is arranged. Whichever column heading is selected is the criterion by which the window will be sorted. For example, if you have the window sorted by date, then clicking the Sort Oder icon will reverse the date-ordering of the file names.

This Sort Order icon only appears in List View under versions Mac OS 8.1 or later. Balloon Help contains information about this and many other Mac OS features. This feature can also be toggled with AppleScript.

Rearranging The Order Of Columns

Starting with the release of Mac OS 8.5, it is also possible to rearrange the order of the columns in a Finder window. For more information on this topic, please see the following article:

Article 24659: "**Mac OS 8.5: Columns In Finder Windows Rearranged**"

Published Date: Feb 20, 2012

iMac: Ringer Equivalency Number (REN) For Internal Modem

What is the Ringer Equivalency Number(REN) for the iMac's internal modem?
This article has been archived and is no longer updated by Apple.
The Ringer Equivalency Number (REN) for the iMac modem is 0.3. This information can be obtained from the product label on the modem card itself.

The maximum REN for a home telephone system is typically 5.0. A customer should contact their local phone company to determine what their maximum REN is.

For information on Ringer Equivalency Numbers and troubleshooting, please see the following Knowledge Base article:

Article 30056: "**Modem: Not Answering Calls**"
Published Date: Feb 20, 2012

Power Macintosh G3 All-in-one: Button Disabler Not Compatible

This article is about the Button Disabler control panel not working with Power Macintosh G3 All-in-one computers.
This article has been archived and is no longer updated by Apple.
The Button Disabler control panel depends on specific controller hardware that is present on the older All-in-one Power Macintosh computers but not on Power Macintosh G3 All-in-one computers. For this reason, Button Disabler will not work on Power Macintosh G3 All-in-one computers. There are currently no plans to add Button Disabler functionality to Mac OS to specifically support the Power Macintosh G3 All-in-one computer. Apple will evaluate the necessity of this feature for future OS releases.

The Button Disabler control panel version 1.2 lets you disable the bezel buttons on the front of certain computer models. If you have a Performa or Power Macintosh 52xx, 53xx, 62xx, 63xx, 5400, 6400, 5500, or 6500 series computer you may use this control panel while running Mac OS 7.6.1 or later. Version 1.2 of the control panel does not work with any Quadra or LC series computers or computers with a PowerPC upgrade card. You may continue to use version 1.1 of the Button Disabler with Quadra and LC series computers.
Published Date: Feb 20, 2012

Mac OS X Server: NetInfo Hostname Requirements

This article give the requirements for Netinfo Hostname.
This article has been archived and is no longer updated by Apple.
The host name of each computer must be unique. The host names must not contain spaces, and the characters must be alphanumeric. Special characters allowed are:

- "." period
- "_" underscore
- "-" hyphen

Published Date: Feb 17, 2012

Modem: V.34 Script With Unusual Modem Types

This article describes how to create a modem script. This is useful when you have a modem model not listed in the Modem control panel, or you are having problems connecting to your Internet Service Provider (ISP) with your existing modem script.
This article has been archived and is no longer updated by Apple.
The following steps can be followed when using "PPP" or "Remote Access" to connect to an Internet Service Provider when either you have a modem which has no script in the Modem control panel or you wish to achieve the same result as the "V34 Modem Script" which Apple issued for both the PowerBook G3 Series and also as a workaround for those having difficulty with V.90 on their iMac computer.

The following steps do not have to be repeated for subsequent connections. After successful completion, the whole process is automated.

1. In the "Modem" control panel select the modem script named "Null Modem 115200".
The 115200 refers to the baud (or data) rate used to communicate with the modem. Most modems can communicate at this fast speed to the Macintosh. If necessary you can select a slower script. Your choices are "Null Modem 19200", "Null Modem 57600", or "Null Modem 9600". However, remember that it is better to select a script that is faster than the line speed (which is usually 33600-56000).

2. In the "Remote Access" or "PPP" control panel click the "Options..." button.

3. Click the "Protocol" tab at the top.

4. Check the box "Connect to a command-line host:".

5. Check the radio button "Use Terminal window".

6. Click "OK" to close the "Options" window.

7. Click "Connect".
Instead of dialing a terminal window appears.

8. Type "AT", then press the Return key.
You should get a message back from the modem saying "OK". If you get no response then there's a possibility that the modem is not connected to the Macintosh, or plugged into the wrong port. You must correct this before continuing.
Note: If your modem replies "0" instead of "OK", that's alright--proceed to the next step.

9. Type "AT&F", then press the Return key.
This resets the modem to the factory profile. This is done to ensure that any special settings made by previous communications programs are restored back to a known state. Look for the "OK" response.

Important: Perform step 10 only if you wish to prevent a 56K connection (as in the V.34 Modem Script). If you are creating a modem script because your modem is not in the Modems control panel, you can skip step 10.

10. Type "AT+MS=11", then press the Return key.
Look for the "OK" response.

11. Type "ATDT" followed by your Internet Service Provider's the telephone number, then press the Return key.
Watch for the "CONNECT" response.
Example: `ATDT 90500555555`

12. Click the "Settings..." button.

13. Check the "Prompt to save Connect Script" box.

14. Click "OK" to close the dialog.

15. Your Internet host should prompt you for your "Account Name". Type your account name, then press Return.
The account name is sometimes case sensitive, so be careful to type it exactly as your ISP has suggested.

16. Your Internet host should prompt you for your "Password". Type your password, then press Return.
The password is sometimes case sensitive, so be careful to type it exactly as your ISP has suggested.

17. If prompted for "Protocol", enter "PPP" followed by Return.

18. Your host should give a welcome greeting. Click the "Continue" button.

This may happen automatically.

19. A "Save As..." dialog box appears. Save the script to the desktop with a name such as "MyScript".

20. Disconnect by clicking the "Disconnect" button.

The remaining steps automate the entire process.

21. Click "Options...".

22. Click the radio button "Use connect script...".

23. Click the button "Import Script...".

24. Choose the file "MyScript" as saved in Step 19.

25. Test by clicking "Connect".

The entire process is now automated.

Mac OS X Server: Changing a File‘s Default Application

This article describes how to change the default application for opening a particular a file.
This article has been archived and is no longer updated by Apple.
The default application is the one which opens when you open a file.

Mac OS X Server matches applications with files they can open automatically. You can't influence the available default applications for files in any way other than by installing or removing applications.

To change a file's default application, follow these steps:

1. In the Workspace Manager, select the file by clicking on it.
2. Open the Tools menu and choose Inspector.
3. Choose Tools from the Inspector pop-up menu.
4. Select an application's icon from the center of the window.
5. Click Set Default.

Mac OS: Help Viewer Quits With Type 3 Error

This article describes a situation where Help Viewer quits with the alert box: "The application "" has unexpectedly quit because an error of Type 3 occurred."

This article has been archived and is no longer updated by Apple.

Symptom

Help Viewer quits and displays an alert box with these messages:

> "The application "" has unexpectedly quit because an error of Type 3 occurred. You should save your work in other open applications and restart the computer."

Figure 1 Help Viewer alert box; earlier version of Internet Config extension installed.

> " The Help Viewer application requires Internet Config 2.0 to run."

Figure 2 Help Viewer alert box; Internet Config extension not installed.

Note: If the computer becomes unresponsive rather than quitting with an alert box, please see article 60228: "**Mac OS 8.5: System Freezes When Opening Help Viewer.**"

Solution

Make sure that Internet Config Extension version 2.0.2 or later is installed in the Extensions folder of the System Folder. If necessary, use the Mac OS Installer to perform a custom installation of the Internet control panel. Both the Internet control panel and Internet Config Extension are installed this way.

Proceed as follows:

1. Open the Mac OS Install application.
2. Click Continue.
3. Select the destination disk from the pop-up menu and click Select.
4. Click Continue twice and then Agree.
5. Click Customize.
6. Make sure Mac OS 8.5 (or your version of Mac OS) is the only check box that is selected.
7. Choose Customized Installation from the pop-up menu.
8. Scroll down to the bottom of the list; click the disclosure triangle to the left of Control Panels.
9. Select the Internet check box.
10. Click OK.
11. Click Start.

This also addresses the requirement for Internet Config expressed in the alert shown in Figure 2. For more information about how Internet Config relates to Mac OS 8.5, please see the following article:

Article 24679: "**Mac OS 8.5: Internet Control Panel Or Internet Config?**"

AppleShare IP 6.x: Earliest Mac OS Client Supported

This article explains what versions of the AppleShare Client and the Mac OS are supported for connecting to an AppleShare IP (ASIP) 6.0 server.
This article has been archived and is no longer updated by Apple.
The earliest supported client varies depending on the largest volume size that is shared on the ASIP 6.0 server.

For servers with volumes smaller than 2 GB:

- AppleShare Client 3.5 or later.
- System 6.0.7 or later.

For servers with volumes larger than 2 GB:

- AppleShare Client 3.5 or later.
- System 7.5 or later.

Volume sizes will be reported incorrectly for volumes larger than 4 GB unless the client is running AppleShare Client 3.7.4 or later and Mac OS 8.1 or later.

Also, file sizes may be reported incorrectly on Mac OS Extended format volumes (also referred to as HFS+ volumes) unless the client is running AppleShare Client 3.8 or later.

For these reasons, Apple strongly recommends that you upgrade your client Macintosh computers to Mac OS 8.1 or later and AppleShare Client 3.8 or later.

AppleShare IP 6.x Mail Server: Automatically Dials Out

This article is about why the AppleShare IP 6.x Mail Server automatically dials out upon starting the Mail Server, and provides a workaround. This article has been archived and is no longer updated by Apple.

Symptom:

I have an AppleShare 6 Mail Server and I am interested in the scheduled dial-out access feature. I have set up my server with dial-out access to my Internet Service Provider (ISP), but every time I start the Mail Server, it dials out immediately and stays connected. Why is it not following the schedule?

Solution:

The AppleShare IP 6 Mail Server, like the AppleShare IP 5 Mail Server, will open TCP/IP on launch and wait for incoming connections on standard mail ports (in the case of AppleShare IP 6, it waits for SMTP, IMAP, and POP). If you have TCP/IP on the server configured to dial out to a PPP server, one of two things will happen:

1. If "Connect automatically when starting TCP/IP applications" is checked in the PPP control panel, then the machine will try to dial out when the Mail Server launches, and it will stay connected as long as the Mail Server is running. Local machines will not be able to connect to the server via TCP/IP.

2. If the "Connect automatically when starting TCP/IP applications" check box is not checked, the Mail Server will appear to start up normally, but nobody will be able to connect via TCP/IP, the AppleShare Mail Server will not connect to an off-site mail server, and the error log will say that Open Transport TCP/IP is not available.

In order for the Mail Server to work properly, TCP/IP on the mail server must be configured for the local network so that it will look on the Ethernet port for incoming connections. In addition to this you must have a router or gateway on the network that dials out on demand. This may be hardware (such as an ISDN router), or software (such as Vicom's Internet Gateway or Sustainable Softworks' IPNetRouter). Once this is set up, the server will try to access the remote mail server on the specified schedule, and the gateway will handle the dial-out connection to the Internet.

For more information on setting up an ASIP Mail Server to connect on a schedule, please see the following article:

AppleShare IP Mail Server: Shows IP Address Instead Of DNS Name

This article discusses a few symptoms where an AppleShare IP server will display IP addresses instead of the DNS name.
This article has been archived and is no longer updated by Apple.
When the AppleShare IP server first starts up, it does a reverse DNS lookup for the IP address of the server as entered in the TCP/IP control panel. If this fails, the server uses its IP address to refer to itself (instead of its DNS name). This can result in a few symptoms:

1. The IP Manager's "Network Info" window lists the DNS name as either Unavailable or as the IP address.
2. The user's email address is listed as user@xx.xx.xx.xx where xx.xx.xx.xx is the server's IP address.
3. On an AppleShare IP 5.x server, this failure will cause a message in the error log that Open Transport is not loaded.
4. On an AppleShare IP 6.x server, the error log will note that the reverse lookup failed, but it will still exhibit symptoms (1) and (2) above.

One of the following troubleshooting steps should resolve this issue:

1. Make sure the proper name servers are listed in the TCP/IP control panel of the server.
2. Make sure the name server containing the DNS record for the server is configured properly to do reverse DNS lookups (a TCP/IP troubleshooting utility like the shareware WhatRoute or Neon software's OTTool can help determine this). If you are using MacDNS, this is done automatically when you add a permanent host.
3. If the above steps indicate everything is okay and you are still having problems, trash the TCP/IP preferences on the server and set them up again from scratch. Be sure not to change the TCP/IP setting while any of the AppleShare servers are running.

For more information on DNS lookups, please see the following article:

AppleShare IP 6.0 - 6.2: Importing/Exporting Users and Groups FAQ

This article contains frequently asked questions (FAQ) regarding importing and exporting users and groups with AppleShare IP versions 6.0 through 6.2, with answers to those questions.

For information about importing users with AppleShare IP 6.3, please see article 25116:

"**AppleShare IP 6.3: Import/Export Retains Passwords, Settings, Relationships**."

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. How do I export my Users & Groups?
2. How do I import my Users & Groups?
3. What is the format for the import/export file?
4. What is the format for the "E-mail Attributes" section for a user?
5. Why can't I import a file into ASIP 6.0 that I exported with ASIP 5.0.x?
6. How can I create an import file using a spreadsheet program?
7. Is there an easier way to transfer Users & Groups to another computer?

Question 1: How do I export my Users & Groups?

Answer: You can create a tab-delimited text file that contains much of the user information needed to populate the "Users & Groups List". Selecting users and groups in the Users & Groups List and choosing Export Users & Groups from the File menu can generate this text file . You must then choose the fields you would like to export (Internet Alias, Comments, Mail Settings). Be sure to keep track of the fields you've selected. You need to remember them when you import the file. During the export a text file is created that includes the information you choose. This file does not contain peripheral user information such as "User may administer server", "Require new password on next login", or "User may log on" (These attributes can be modified after importing the users by using the batch change user attributes). When a group is selected for export, all members of that group are exported. However, the file does not contain any group membership information. For security reasons it is not possible to export the user passwords.

Question 2: How do I import my Users & Groups?

Answer: Importing users requires a properly formatted import file. When the Users & Groups List is the frontmost window, choose Import Users from the File menu and select the file to be imported. Then choose the fields you would like to import. Be sure to select only the fields that were selected when the file was exported or created. Once all the users are imported you can recreate any groups that you require. Be sure to double check at least one of the users to make sure the import was successful. **Note:** If you choose to import the Mail Settings you must also import the Internet Alias.

Question 3: What is the format for the import/export file?

Answer: The file format changes depending on the fields you select to import or export. An example of the basic format is below (selecting to import all fields):

Note: <tab> in these examples means the tab character that is produced when you press the Tab key on the keyboard. <carriage return> in these examples means that a Return character, which is generated by the Return key, should be placed in that spot.

```
UserName<tab>Internet Alias<tab>Password<tab>Comment<tab>

E-mail Attributes<carriage return>
Jan Wu<tab>j.wu<tab>easypassword<tab>Nice person<tab>

NoMail<carriage return>
```

Note: The example above should occupy only two lines; it has been artificially wrapped to four lines in this article to conform to web browser constraints.

If you do not want to import the "Comment" field you remove the <tab> and comment text. The E-mail Attributes would slide over to the left and look like this:

```
UserName<tab>Internet Alias<tab>Password<tab>

E-mail Attributes<carriage return>

Jan Wu<tab>j.wu<tab>easypassword<tab>NoMail<carriage return>
```

Note: The example above should occupy only two lines; it has been artificially wrapped to three lines in this article to conform to web browser constraints.

Question 4: What is the format for the "E-mail Attributes" section for a user?

Answer: The import section for user email settings can have many different attributes. Here is the general layout for the "E-mail Attributes", the format changes depending on the Mail Account Setting (No Mail, Has Mail, Autoforwarding).

```
Mail Account Setting <tab> APOP setting <tab>

Login & Mailbox setting <tab> Notification Preference
```

Note: The example above should occupy only one line; it has been artificially wrapped to two lines in this article to conform to web browser constraints.

The following is a list of all the possibilities for each mini-field in E-mail Attributes. The keywords indicate the mail setting. Do not put in spaces before or after the TABs.

```
NoMail
ForwardAppleTalk <tab> Username <tab> Server name <tab> Zone name
ForwardInternet <tab> user@domain.com
HasMail <tab> RequireAPOP <tab> POPOnly <tab> NoNotification
HasMail <tab> NoRequireAPOP <tab> POPOnly <tab> NoNotification
HasMail <tab> NoRequireAPOP <tab> IMAPOnly <tab> NoNotification
HasMail <tab> NoRequireAPOP <tab> BothPOPIMAPShare <tab> NoNotification
HasMail <tab> NoRequireAPOP <tab> BothPOPIMAPSeparate <tab> NoNotification
HasMail <tab> NoRequireAPOP <tab> BothPOPIMAPSeparateShowPOP <tab> NoNotification
HasMail <tab> NoRequireAPOP <tab> BothPOPIMAPShare <tab> EnableNotifyIP <tab> x.x.x.x
HasMail <tab> NoRequireAPOP <tab> BothPOPIMAPShare <tab> EnableNotifyLastIP
```

Here is an example including the mail settings for a user (this should all be on one line):

```
Jan Wu <tab> j.wu <tab> password <tab> HasMail <tab> NoRequireAPOP <tab>

 BothPOPIMAPShare <tab> NoNotification<carriage return>
```

Note: The example above should occupy only one line; it has been artificially wrapped to two lines in this article to conform to web browser constraints.

Question 5: Why can't I import a file into ASIP 6.0 that I exported with ASIP 5.0.x?

Answer: The format of the "E-mail Attributes" section has changed between ASIP 5.0.x and ASIP 6.0. You must modify the file before you can import it into ASIP 6.0.

Question 6: How can I create an import file using a spreadsheet program?

Answer: As long as the file you create has the proper format described above you can use whatever method you prefer to generate your import file. Most spreadsheet programs allow you to export the spreadsheet document inserting a tab between cells. Make sure the file that you create matches the format that is expected when you choose the fields to import. If you choose to import only the Internet Alias and Mail Settings be sure that your file doesn't include an extra tab that would indicate where the Comments field would go.

Question 7: Is there an easier way to transfer Users & Groups to another computer?

Answer: Yes. If you have your Users & Groups configured to your liking on one computer you only need to move over the Users & Groups Data File from the Preferences folder of the first computer into the Preferences folder of the second computer. Keep the name of the Users & Groups Data File the same when you copy it to the other computer. You must also restart the other computer with the extensions turned off so you can replace the existing Users & Groups File with the new one. If the extensions are loaded this error appears: "The file is in use and cannot be replaced." Once you've restarted with the new Users & Groups File in place you must open Easy Setup again on the second computer. You must also enter a valid serial number. It can be the same if you are running the File Server on one computer and the Mail Server on another. If you run the File Server on two computers you need two serial numbers.

Apple Mail Server: DNS Configuration

This article explains the most common Domain Name Server (DNS) configurations used with a mail server.
This article has been archived and is no longer updated by Apple.

DNS Fundamentals

The following section will go over DNS fundamentals. A Domain Name Server's primary duty is to take IP addresses and return host names, and vice versa. For example, a computer's IP address of 15.1.1.10 will be converted to 'starfury.zone.com' by the DNS. There are several different types of records that are used with a DNS. The most important is the A-record, which returns an IP address for a host name. The A-record's inverse is the PTR record, which returns a host name for an IP address. The PTR record is a little strange because it is created by reversing the IP address and adding 'in-addr.arpa.' to the end. There is also a CNAME record which is a host name alias to another host, this allows multiple host names to resolve to one IP address. These three record types are illustrated below.

```
A-record   name -> IP address     host.domain.com -> 12.1.8.51

PTR        IP address -> name     51.8.1.12.in-addr.arpa.  -> host.domain.com

CNAME      host name alias        name.domain.com (A-record name) = othername.domain.com
```

The next type of DNS record is only used by SMTP Mail Servers. It is called an MX record, or mail exchanger. An MX-list is used with a host to specify how mail for that host should be delivered. The MX-list contains all the possible mail exchanger hosts along with preference values indicating which host should be the final recipient of mail. A host with a lower number value has higher preference (a host with a value of 10 would be preferred over a host valued at 15). If two hosts have the same preference value, they do load-balancing between them. MX records are best explained by example.

MX-list record for mail.company.com
10 mail.company.com
20 mail-backup.company.com
30 isp-backup.isp.net

In this example a mail server attempting to deliver mail to 'mail.company.com' will ask DNS for the MX-list shown here. The server will then try and deliver the mail to the host on the MX-list that has the lowest numerical preference value. In this case it would be 'mail.company.com'. The server will then look up the IP address for 'mail.company.com' and deliver the mail to that address. If that host is not available the mail server will attempt to connect to the next best host, 'mail-backup.company.com'. If 'mail-backup.company.com' is also not available the mail server will then try 'isp-backup.isp.net'. Supposing 'isp-backup.isp.net' was up it would accept the mail and then assume responsibility for forwarding it on to 'mail.company.com' because that host is the preferred final destination for mail addressed to 'mail.company.com'. If all three of these hosts are down the attempting mail server will wait for a while (usually around 5-20 minutes) and try all three again in preference order.

There is a lot more complexity to DNS than what has been described, but that is enough background information to get started. This next section will describe the ways in which the Apple Mail Server uses DNS to deliver mail.

How the Apple Mail Server uses DNS

The Apple Mail Server uses DNS to discover what host names should be considered "local" and to properly deliver mail to other mail servers. Without a DNS available the mail server will be essentially nonfunctional. Many mail delivery problems are the result of a misconfigured DNS server. The Apple Mail Server is designed to use the information returned by DNS to auto-configure itself so that it "knows" what names it can be called by.

Who am I?

One of the first things the mail server does when it starts up is determine what its own names are. It will use DNS to look up the PTR record for the server computer's IP address to discover the name or names that goes with it (Example server IP 15.0.0.21 = 'mail.zone.com'). This name will be marked as a "local" host in the host list. The server will also mark any hosts that end up being local when resolved through DNS. If a mail comes in that is addressed to 'alias.zone.com' and this name maps to 'mail.zone.com' using a CNAME record, then it will be marked local as well. MX-list hosts can also become "local" hosts if they point to the same computer, (zone.com MX-list; 5 mail.zone.com 10 nowhere.zone.com) 'zone.com' will be "local". All mail addressed to "local" hosts will be delivered to users in the mail servers Users & Groups list. Any hosts which are not local will need to be contacted for message delivery.

Server IP address 15.0.0.21
PTR for 21.0.0.15.in-addr.arpa. -> mail.zone.com
A-record for mail.zone.com -> 15.0.0.21
CNAME for mail.zone.com -> alias.zone.com

MX-list for zone.com
5 mail.zone.com
10 nowhere.zone.com

Local Host Names: mail.zone.com, alias.zone.com, zone.com

Using MX-lists
MX-lists are usually used in two ways. (1) Providing an alternative/backup mail server for a host, and (2) mapping a domain wide address to a specific mail server. It is important to have a backup mail server available to handle mail for your domain when your primary mail server goes down. You should configure an MX-list for your host which indicates mail for your mail server 'mail.wigit.com' should be delivered to 'mail.wigit.com' unless it is down, in which case it should be delivered to your backup server, 'mail-backup.wigit.com', or your Internet Service Provider's mail server, 'mail-backup.isp.net'.

MX-list for mail.wigit.com
10 mail.wigit.com
15 mail-backup.wigit.com
20 mail-backup.isp.net

The second use for the MX-list is to provide a "shortcut" email address for your mail users. An MX-list can be created for a host that doesn't have an A-record, this is called an MX-only record. It is used to simplify email addresses, instead of having an email address of 'user@mail.wigit.com' you can simply use 'user@wigit.com'. To do this, create an MX-only record which indicates mail for 'wigit.com' should go to 'mail.wigit.com'. You'll also want to include your mail server backups in this MX-list.

MX-only list for wigit.com
10 mail.wigit.com
15 mail-backup.wigit.com
20 isp-backup.isp.net

The mail server will also use the MX-list for all outgoing mail. It will look up the MX-list for each host and determine which computer should be contacted to deliver the mail. If the mail server comes across a host that does not have an MX-list it will attempt to connect to the A-record address for that host. The server will also try the A-record address if all hosts on the MX-list are unreachable.

Microsoft Internet Explorer: "Java VM Could Not Be Loaded" Message

This article describes how to fix the Microsoft Internet Explorer error message that "Apple MRJ" could not be loaded.
This article has been archived and is no longer updated by Apple.
Usually the Java error message, shown in figure 1., appears because you have not installed Apple MRJ (MacOS Runtime for Java - Apple's implementation of a Java virtual machine).

Figure 1 MRJ error message

By default, when installing Internet Explorer 4.0.1 (either from Microsoft's standalone installer or via the Mac OS 8.5 installer), the preference is set for Internet Explorer to use Apple MRJ. If Apple MRJ software has not been installed, any time you visit a web site that contains java you will receive this error message. There are two ways to resolve this:

Solution One

Set the preference for Internet Explorer to use it's own java machine as opposed to Apple MRJ (see Figure 2). To do this, while you are using Internet Explorer, perform the following steps:

1. Choose Preferences from the Edit menu.
The Preferences window appears.
2. Select Java from the Web Browser drop-down list on the left side of the window.
3. Check Enable Java (if needed)
4. Select Microsoft Virtual Machine instead of Apple MRJ from the Java Virtual Machine pull-down menu.
5. Click OK.

Figure 2 Microsoft Internet Explorer Preferences dialog.

Solution Two

Another option is to install Apple MRJ. The installer can be downloaded from Apple Software Updates sites. The Apple MRJ installer is also available on the Mac OS 8.x and Mac OS 9 CD.

This article can help you locate the software update mentioned here:

- Article 14724: "**Where To Find Apple Software Updates**" - Lists online services for free Apple software updates.

Published Date: Feb 20, 2012

Power Macintosh G3 Desktop: CD does not mount

When I insert a CD into the CD-ROM drive in my Power Macintosh G3 (Desktop model), the CD icon does not appear on the desktop.
This article has been archived and is no longer updated by Apple.
Here are some steps you may want to try to resolve this issue:

Step 1
Try using a known good compact disc. The CD you are currently using may be unusable. Try a known good CD to see if the icon will show up on the desktop.

Step 2
Verify that the CD-ROM software is installed. You can do this by opening the Apple Menu Items and making sure the Apple Audio Player is present. If it is not present, go to step 3.

Step 3
Start up from the Power Macintosh G3 Desktop and Minitower Computers Software Install or Restore CD that came with the computer, and reinstall the CD-ROM software by reinstalling the System Software. Perform this step to assure a good copy of the CD-ROM software is installed in the System Folder.

Step 4
If the above steps don't solve the issue, you can get further assistance from the following support resources:

- The Apple Support website.
- A local Apple Authorized Service Provider. You can find a Service Provider through the Apple Support website.
- Apple, Inc. Call the number on the back of your Apple Support Card.

Modem Initialization Strings

This article contains the initialization string for the iMac's internal 56K modem.

Note: The modem used in the iMac and the Power Macintosh G3 (Blue and White) are similar, thus the information provided in this article is relevant to the Power Macintosh G3 (Blue and White) also.
This article has been archived and is no longer updated by Apple.
The iMac modem init string is embedded in the modem script (CCL) that is stored in the Modem Scripts folder located in the Extensions Folder. These files can be inspected using a text editing application.

NOTE: Apple does not provide support for CCL file editing or support the use of any CCL's other than those included in the Mac OS.

The initialization strings that have been provided for the iMac modem scripts are as follows:

iMac Internal 56K:
AT&FE0Q0V1X4&C1&K3S95=1S7=75S0=0\\13

iMac Internal 56K (v.34 Only):
AT&FE0Q0V1X4&C1&K3S95=1S7=75S0=0+MS=11\\13

But these strings can be condensed even further.

Broken apart, we have "AT &F E0 Q0 V1 X4 &C1 &K3 S95=1 S7=75 S0=0 \\13"

Given that a number of these items are there for use within the CCL, they are not typically required for basic initialization of the modem.

Q0, V1, X4, &C1, &K3 and S0=0 are default settings for the modem.

These additional settings are used in the interface coding guidelines for the CCL so as to provide error checking redundancy during initialization.

If a register setting fails to initialize properly during this process, the CCL has additional logical statements that will provide feedback to the application that is dialing the modem.

So in removing them, we get: AT &F E0 S95=1 S7=75 \\13

While E0 disables echo in command mode, whether it remains here will be largely dependent upon whether the particular dialing program can make use of it. It is typically not required, so we remove it. The \\13 is for nothing more that a carriage return, to instruct the program to interpret the line. This with be handled by the dialing program, so is not required.

So now we have: AT&FS95=1S7=75

Finally, the W2 command implements connection rates for the connection. Other connection information that is defined by the "S95=1" is hardly ever used and can also be removed. So with the substitution of W2 for S95=1,

we get: AT&FW2S7=75

and, for V.34: AT&FW2S7=75+MS=11

For more information on AT commands, see the document "AT Commands.pdf," located in the Internal Modem folder in the Apple Extras folder on you hard drive.

You can also download the AT Commands PDF document. To download a pdf of the AT Command set, go to the Apple Manuals Web site query screen at **http://www.info.apple.com/manuals/manuals.qry**. Enter AT Command as your search string to locate then download the pdf document.

Mac OS: Out Of Memory Errors With File Synchronization

The computer may stop responding when using the File Synchronization control panel to synchronize folders with custom icons.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box appears with an error message that says: "Out of Memory", and the system stops responding. This happens when you use the File Synchronization control panel at the same time a dialog box is on the screen, and one of the folders you're synchronizing has a custom icon. For example, you've opened Preferences from the Edit menu while synchronizing a folder with a custom icon and this error occurs.

Solution

Download and install Mac OS 9.1, which is available in article 75103 "**Mac OS 9.1: Software and Before You Install Document**" .

You can work around the issue by eliminating custom icons on the folders you want to synchronize. Follow these steps to remove custom folder icons:

1. Close the File Synchronization control panel.
2. Find and select the folder with the custom icon.
3. Choose Get Info from the File menu.
4. Click the custom icon in the Get Info window to select it.
5. Choose Cut or Clear from the Edit menu, or press the Delete key.
6. Close the Get Info window.

AppleShare IP: Improving Client Finder Performance

This article is about improving Client finder performance while using AppleShare IP.
This article has been archived and is no longer updated by Apple.

Symptom:

One of the share points on my AppleShare IP file server is a drop folder. Sometimes this folder contains many files, some of which are very large. When this happens, the clients logging into this share point experience slow performance in the Finder when mounting the directory.

Solution:

Reducing the information displayed about files in a shared directory on the server will improve client performance when mounting the shared directory. For example, disabling the option to calculate folder sizes (on the server) will improve client performance as the client will not need to display that information.

The following changes may be made on the server to improve performance in the Finder.

Mac OS 7.6.x

Open the Views control panel. Under List Views, choose the smallest icon and deselect all options that are not necessary.

Mac OS 8.1 and Mac OS 8.5

Open the shared directory and under the View menu, select View as List. Then under the View menu, select View Options. In the View Options window, choose the smallest icon and deselect all options that are not necessary.

All Mac OS Clients

All clients will benefit from disk cache settings of between 256K or higher under Mac OS 7.6.x, and 512K or higher under Mac OS 8.1. Clients using Mac OS 8.5 should use the default setting in the Memory control panel.

Virtual memory, when enabled on the client, will allow paging of Finder information to disk. The time necessary to page information to disk may cause temporary delays in the Finder.

In general, clients should connect to the server via TCP/IP rather than AppleTalk when possible. This should happen automatically, but can be ensured by entering the IP address of the server in the Chooser or in the Network Browser under Mac OS 8.5. However, if the client's TCP/IP setting is configured for MacIP, then TCP/IP connections may be slower than AppleTalk.

Clients should make aliases of server volumes rather than using the Chooser. This will save time and network bandwidth when opening a connection to the server.

Lastly, the client should close all open windows on the server volume if not actively being used. Making aliases of embedded directories, or accessing embedded directories from within an open application are also good ways to reduce network traffic.

PowerBook G3 Series: How to Reset the Modem

This article explains how to reset the PowerBook G3 Series modem without restarting the PowerBook.
This article has been archived and is no longer updated by Apple.
Yes. You can reset the modem using AppleWorks or ClarisWorks or another communications application such as Zterm.

1. In AppleWorks, open a new Communications document.

2. Set the Connections Settings as follows:

- Method: Serial Tool
- Baud Rate: 57600
- Parity: None
- Data Bits: 8
- Stop Bits: 1
- Handshake DTR & CTS
- Current Port : Internal (or appropriate port)

3. Select Open Connection from the Session menu (this will let you type modem AT commands)

4. Type the following:

```
AT&F
```

Then press the Return key on your keyboard. Wait for the computer to return the OK message.

5. Type the following:

```
ATZ
```

Then press the Return key on your keyboard. Wait for the computer to return the OK message. This should reset the modem to the factory default settings.

Alternate Method

Here is an alternate, simpler method of resetting the modem, though it will work only if the software you intend to use relies upon the Modem control panel (for example, ARA 3.0 or OT/PPP):

Open the modem control panel and change the Connect via: to modem/printer port and then change it back to internal modem.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Power Macintosh G3: No sound output quality setting available

I have a Power Macintosh G3 with a DVD ROM drive and I have installed OS 8.1 onto it. When I open the Monitors and Sound Control panel, the only available sound output quality is 0.00 kHz and there is no choice for sound monitoring source.
This article has been archived and is no longer updated by Apple.
These symptoms are very similar to those that occur when the personality card is poorly seated or malfunctioning. It may, however, be caused by the wrong CD being used to install Mac OS onto the computer. The following CDs will cause this behavior:

691-1924-A
691-1969-A
691-2042-A

The way to resolve this situation is to reinstall Mac OS from the CD that came with the computer.

For more information on this topic, please see article 24503: "Power Macintosh G3: Loose I/O Card Affects Monitors & Sound Control Panel"
Published Date: Feb 20, 2012

Mac OS X Server: ps Command (Process Status)

This article discusses the ps command in Mac OS X Server.
This article has been archived and is no longer updated by Apple.
Determining what processes are **already** running can be an important step in troubleshooting. The command 'ps' (entered on the command line in a Terminial window) with a variety of flags can give information on what is running for the user, the process id, the parent process id, and so forth.

Included in any ps display:

PID	the process id	the number used to identify this process when halting, killing or resuming this process
TT	control terminal	the session that initiated this process AND when ended, typically ends this process
STAT	state	for example (I)dle, (S)leeping, s(T)opped
TIME	-	cpu time used by the process
COMMAND	-	which command

Notice that shells (sh, csh, tcsh, bash, for example) show up as processes in most lists.

Following are some common examples of using ps.

ps

Issued alone, ps displays the processes running for that user. So, if you are logged in as mary and run ps, you will see the processes you, mary, are running.

```
[mowed:~] george% ps
PID TT STAT  TIME COMMAND
1749 p1 I     0:00 -tcsh (tcsh)
```

ps -a

Displays all processes with terminals. Typically, a user can only view their own processes.

```
[mowed:~] george% ps -a
PID TT STAT  TIME COMMAND
1749 p1 I     0:00 -tcsh (tcsh)
1775 p2 I     0:00 login -h 555.555.555.555 -p
1776 p2 I     0:00 -tcsh (tcsh)
1789 p2 I     0:00 -csh (csh)
1822 p2 S     0:00 -tcsh (tcsh)
1906 p2 R     0:00 ps -a
```

ps -l

Asks for a long listing, with fields PPID, CP, PRI, NI, ADDR, VSIZE, RSIZE and WCHAN as described below.

```
[mowed:~] george% ps -l
       F  UID   PID  PPID CP PRI BASE VSIZE RSIZE WCHAN STAT TT  TIME COMMAND
    4006 32561  1749  1730  0  10   10 2.75M 1.07M     0  I   p1  0:00 -tcsh (tc
    4006 32561  1776  1775  0  10   10 2.75M 1.08M     0  I   p2  0:00 -tcsh (tc
    4006 32561  1822  1789  0  10   10 2.75M 1.05M     0  S   p2  0:00 -tcsh (tc
```

new items:

F	-	flags associated with process.
UID	-	numerical user-id of process owner.
PPID	parent process id	gives the id of the process that started this process.
CP	-	short-term cpu utilization factor (used in scheduling).
PRI	-	process priority (non-positive when in non-interruptible wait).
VSIZE	-	virtual size of the process (in bytes).

RSIZE	-	real memory (resident set) size of the process (in bytes).
WCHAN	-	event on which process is waiting (an address in the system).

ps -x

Asks even about processes with no terminal. The most common processes with no terminal are daemons or other processes started by the system.

The flags can be combined. For instance, 'ps -alx' is commonly used to view system processes and their parent process ids. 'ps' can be used to display percent of cpu use or memory use as well as other nifty information not covered here. For more information, consult the System Reference Manual by typing the following command at the Terminal prompt:

```
man ps
```

Sound Input: Difference between External Mic and Sound In

After installing Mac OS 8.5 or later, I have options for both "External Microphone" and "Sound In" in the SoundSource Strip and the Monitors & Sound control panel. What is the difference between the two?
This article has been archived and is no longer updated by Apple.
Mac OS 8.1 gave you the option of using the external sound-in jack by selecting the "Sound In" option in the Control Strip or the Monitors & Sound control panel. However, the sound would play through to the speakers by default which could cause feedback when the external sound source was a microphone.

Mac OS 8.5 and later, addresses that issue by offering an "External Microphone" source which uses the same sound-in jack, but turns speaker playthrough off by default.

Power Macintosh G3: Where Is IomegaDrive Option Application?

Learn where to find the IomegaDrive Option Application for the Power Macintosh G3.
This article has been archived and is no longer updated by Apple.
The Power Macintosh G3 Rev2 (blue) CD, as well as the Power Macintosh G3 All-in-one CD, does not have the IomegaDrive Option application. You can download "IomegaWare Tools Package" from Iomega and also get IomegaDrive Options and other useful software. The package installer will put IomegaDrive Options into the Control Panels Folder.

The IomegaDrive Options application is used to set the drive, and to replace the driver on any inserted Zip disk with the same version as in the System Folder.

AppleWorks 5.0.3: Where Is The Introduction to AppleWorks Tour?

The AppleWorks 5 User's Manual and Quick Help refer to an Introduction to AppleWorks menu item. This item was not included on the AppleWorks CD. This article explains why it was not included.
This article has been archived and is no longer updated by Apple.
When ClarisWorks 5.0.x was being updated to AppleWorks 5.0.3, the Introduction to ClarisWorks tour was removed from the installer because the tour referred to ClarisWorks instead of AppleWorks. Since the AppleWorks team wanted to focus on making sure AppleWorks 5.0.3 was compatible with the latest Power Macintosh G3 and iMac computers, Mac OS 8.1, Mac OS 8.5 and PC computers running Windows 98.

Although the references to ClarisWorks in the AppleWorks User's Manual and Help were changed to AppleWorks, unfortunately, the references to the Introduction to AppleWorks tour were not removed before AppleWorks 5.0.3 shipped. However, **all** information that was in the Introduction to ClarisWorks tour is in the AppleWorks 5 User's Manual and AppleWorks Help.

Power Macintosh G3: Maximum Wattage Used By PCI Cards

This article provides the electrical specifications for four of the cards currently offered through the Build To Order (BTO) web page.
This article has been archived and is no longer updated by Apple.
Following are the electrical specifications for four of the cards currently offered through BTO:

.

Card	Maximum Wattage
Ultra Wide SCSI card	10 watts maximum
128-bit 2D/3D graphics accelerator card	8.925 watts maximum
Firewire card	10 watts maximum (1)
10/100 Ethernet card	6 watts maximum
Notes (1) With all three ports of the firewire card in use, the card uses approximately 1 watt. However, since the firewire specification allows the card to provide "bus power" to connected devices which don't provide their own power, and the card is fused at a maximum of .75 amps (at 12v), that adds another possible 9 watts, for a maximum of 10 watts.	

.

AppleShare IP: Application Launching and Saving

This article discusses several issue with launching and saving applications while using AppleShare IP.
This article has been archived and is no longer updated by Apple.
There are several issues here for discussion:

- Privileges set at the AppleShare IP server
- Read vs. read/write will affect how an application is launched, and its ability to open and save documents.

There have been several updates including ClarisWorks 5.0v2 and HyperCard 2.4.1 to correct issues when using these applications located on a server.

ClarisWorks 4

ClarisWorks 4.0v6 allows the saving of documents on volumes that are larger than 2 gigabytes. To update to version 4.0v6 from version 4.0v1, two updates must be run.

Select the appropriate ClarisWorks 4.0v5 Updater (for Education or Retail.) After updating to 4.0v5, use the ClarisWorks 4.0v6 Updater. Both updates may be found at Apple Software Updates sites.

Customers who have ClarisWorks 4.0 must upgrade to ClarisWorks 4.0v1 or 5.0 to resolve this particular issue.

ClarisWorks 5

There are two issues that may affect ClarisWorks 5 users.

ClarisWorks 5.0v2 corrected an issue when saving documents when the application was launched from a read-only volume. Customers can upgrade to ClarisWorks 5.0v2 from version 5.0 directly using the 5.0v2 updater found at Apple Software Updates sites.

Second, privileges set at the AppleShare IP server, read vs. read/write, will affect how an application is launched, and its ability to open and save documents.

HyperCard 2.4.1

Hypercard 2.4.1 corrected an issue which would result in an erroneous "Can't open stack. File is busy." error message.

If a HyperCard stack is copied to an AppleShare server, then that stack is opened from the server, Hypercard will give an error: "Can't open Stack. File is busy." Workstations can still access the stack over the network. The Hypercard 2.4.1 updater can be found at Apple Software Updates sites.

The updater works on HyperCard 2.3, 2.3.5, or 2.4.

This article can help you locate the software updates mentioned here:

Sherlock: Internet Config Conflict

I am having trouble using Sherlock. When I try to perform an Internet search, I get an error dialog stating, " A network error occurred. Check your network connections and settings, then try again." Can you help?
This article has been archived and is no longer updated by Apple.
This error message may appear for a number of reasons. One possible cause is having an older version of Internet Config.

There is an Internet Config preference property (kICUseHTTPProxy) that is defined to be a boolean (1 byte). It has not been determined exactly which application does this, but at least one application sets this to be a word (2 bytes). When Sherlock asks Internet Config for this preference property, an error is returned because Sherlock is asking for a byte, but the property is stored as two bytes.

Follow these steps to work around the issue (Mac OS 9.1 users should skip Steps 2 and 3):

1. Open the Internet control panel.
2. Choose User Mode from the Edit menu; a dialog box appears.
3. Choose Advanced User Mode by clicking its radio button; then click OK to dismiss the dialog box.
4. Click the Advanced tab in the Internet control panel.
5. Click the Firewalls icon in the scrolling list.
6. Click the Web Proxy checkbox to select it.
7. Choose Save Settings from the File menu.
8. Click the Web Proxy checkbox to deselect it.
9. Choose Save Settings from the File menu.

This resets the kICUseHTTPProxy Internet Config preference property to be stored as a byte instead of 2 bytes.

For related information, please see the following articles:

AppleShare IP 6.1: Upgrading To AppleShare IP 6.1 Read Me

This article is comprised of the Read Me for Upgrading To AppleShare 6.1. This software was released by Apple on December 4, 1998 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.
This article has been archived and is no longer updated by Apple.

Upgrading to AppleShare IP 6.1

This document contains important information and upgrading instructions for AppleShare IP 6.1. You may want to print this document and keep it for future reference.

The 6.1 update of AppleShare IP provides several new features and enhancements, and fixes problems from previous releases. You must have a retail version 6.0 of AppleShare IP to install this update. The 6.1 update will not install on seed releases of AppleShare IP.

New Features

- Mac OS 8.5 compatibility
- remote administration-the ability to securely administer your server from any Web browser-capable Macintosh or PC-compatible computer.
- TCP Filter software for extra security
- ability to host multiple Web sites on a server
- file sharing performance improvements
- ability to log into a user's account with the administrator's password for access privileges verification
- support for shared mail folders over IMAP
- a First Aid tool for verifying, repairing, and backing up key AppleShare IP data files
- an advanced configuration tool for the Web & File Server
- Password-protected printing support (requires LaserWriter 8.6.1 or later)

New System Requirements

The following additional system requirements are new with AppleShare IP 6.1. Previous system requirements still apply; see your AppleShare IP 6.0 Getting Started manual for details.

- Mac OS 8.5 is recommended. TCP Filter software requires Mac OS 8.5; all other features require Mac OS 8.1 or later.
- Installation requires approximately 75 MB of free disk space.

Installation Instructions

Preparing Your Computer

Before installing AppleShare IP 6.1, you need to back up your System Folder using a backup application that can copy invisible files. Backing up will allow you to restore a copy of the previous Users & Groups Data File and the AppleShare PDS file (an invisible file installed on every volume), and make it possible for you to switch back to your previous version of AppleShare IP if you desire. When you make your backup copy, make sure that the AppleShare IP Web & File Server is running.

Installing AppleShare IP Software

You can install the AppleShare IP software using either the Easy Install or the Custom Install option. In the Installer, be sure to select the disk that holds the current AppleShare IP 6.0 folder.

To perform an Easy installation, double-click the icon labeled Installer and follow the instructions onscreen for an Easy Install.

To perform a Custom installation, follow these steps:

1. Double-click the icon labeled Installer and follow the instructions onscreen.
2. When the Install AppleShare IP window appears, choose Custom from the pop-up menu.
3. Select the checkboxes next to the software you want to install, then click OK.
4. Click Install to install the software, then follow any remaining instructions that appear onscreen.

Installing AppleShare 3.8.1 Client Software

To update client computers to AppleShare 3.8.1, see the Read Me in the Client Software 3.8.1 folder on your hard disk. See your license agreement for the number of clients your AppleShare IP server may have.

Installing Mac OS 8.5 and AppleShare IP 6.1

If you are installing Mac OS 8.5 at the same time as you are installing AppleShare IP 6.1, be sure to install Mac OS 8.5 first following the instructions that come with that software, then restart with Extensions off by holding down the shift key while restarting, and then install AppleShare IP 6.1.

To preserve your AppleShare IP 6.0 setup, which requires OpenDoc, do not select the "Clean Install" for Mac OS 8.5.

If you choose to do a clean install of Mac OS 8.5, you will need to install the following software in this order after the Mac OS 8.5 installation:

1. Reinstall OpenDoc from the Mac OS 8.1 CD and restart.
2. Reinstall AppleShare IP 6.0 and restart the computer with Extensions off by holding down the shift key.
3. Install the AppleShare IP 6.1 update.
4. Copy the file "Users & Groups Data File" from the Preferences folder in the backup copy of your System Folder to the Preferences folder inside your newly-created System Folder.

Setting Up AppleShare IP

Using Easy Setup

You need to use the AppleShare IP Easy Setup program before you can use AppleShare IP. AppleShare IP Easy Setup asks a few questions about how you plan to use AppleShare IP and sets up your AppleShare IP servers accordingly.

To use AppleShare IP Easy Setup, open the AppleShare IP folder on your startup disk and double-click the AppleShare IP Easy Setup icon. Follow the instructions that appear onscreen. Your previous serial number will appear automatically; you do not need to enter a new serial number.

If you need more help using AppleShare IP Easy Setup, see your AppleShare IP 6.0 Getting Started manual.

Setting Up Remote Admin for the First Time

To use the Web browser-based remote administration feature in AppleShare IP, you need to enable it in the Web & File Admin program. You also must be designated as an administrator in that program's Users & Group List.

For extra security, you can use TCP Filter software to allow access to the AppleShare IP Remote Admin application only from specific computers. See the TCP Filter section of AppleShare IP Help for details.

Follow these steps:

1. Click the Open Web & File Admin program button in the AppleShare IP Manager. Enter your name and password in the Administer Web & File Server dialog box, then click OK.
2. Make sure the Web & File server is running by checking the status line in the Web & File Server Activity window. If it's not running, choose Start Web & File Server from the Server menu.
3. Choose Web & File Server Settings from the Server menu.
4. Select the "Allow remote administration via a Web browser" checkbox.
5. Choose Web from the pop-up menu.
6. Make sure the Enable Web Service checkbox is selected.
7. Click Save.

Your changes take effect immediately. To administer your server remotely from any computer on the network, type the following URL in any industry-standard Web browser:

http://<your Web server's DNS name>/.admin

Contents of This Update

This update installs a folder called AppleShare IP 6.1 on your hard disk. If you use the Recommended Installation option, the folder will include the following files:

- AppleShare IP 6.1 Read Me, which contains late-breaking information
- AppleShare IP Easy Setup, a program that you use after installing AppleShare IP to perform first-time setup tasks.
- AppleShare IP First Aid folder, which contains the AppleShare IP First Aid application for repairing key AppleShare IP data files, and the First Aid Read Me file.
- AppleShare IP Help and AppleShare IP Remote Help, HTML documents that explain how to administer your servers.
- AppleShare IP Manager, a program that allows easy access to the AppleShare IP administration programs.

- Mail Server folder, which contains the Mail Admin program, the AppleShare IP Mail Tool, the Mail Tool Read Me file, an alias to the Mail Server, and two Apple Guide (Help) files.
- Print Server folder, which contains the Print Admin program and two Apple Guide (Help) files.
- Web & File Server folder, which contains the Web & File Admin program, an alias to the AppleShare IP Web & File Server, and two Apple Guide (Help) files.
- Help Files folder, which contains the HTML documents for AppleShare IP Help.
- SimpleText, a simple word-processing program that opens Read Me files.
- TCP Filter folder, which contains the TCP Filter Admin application and two Apple Guide (Help) files.

Other folders and files are installed in the following locations:

- AppleShare Client folder is placed on your hard disk. This folder contains the Installer program, the AppleShare IP Client 3.8 User's Manual, a Read Me file, and the AppleShare Client 3.8.1 Chooser extension.
- Web Folder is placed on the hard disk. It contains a file named Default.html (your default home page) and associated image file, Plug-ins folder, Error Files folder, and the Remote Admin folder, which contains files for the AppleShare IP Remote Admin application. (Note: Existing Default.html files and associated images are not lost during the upgrade process.)
- AppleShare IP Preferences folder is installed in the Preferences folder inside the System Folder.
- AppleShare IP Editors folder is installed in the AppleShare IP Admin Libraries folder in the Editors folder in the System Folder.

The following files and folders are installed in the Extensions folder inside the System Folder on your startup disk:

- Apple Browser Launcher
- AppleShare IP Libraries
- AppleShare IP Mail Config
- AppleShare IP Mail Server
- AppleShare IP Print Config
- AppleShare IP Print Server
- AppleShare IP Registry
- AppleShare IP Registry API
- AppleShare IP UAM folder
- AppleShare IP Web & File
- AppleShare IP Web & File Config
- AppleShare IP Web & File Server
- MWRuntimeLib
- PC Net Exchange
- TCP Filter

If you use the Custom Install procedure, a subset of these files and folders is installed on your installation disk.

For More Information

See AppleShare IP Help. You can open AppleShare IP Help by choosing AppleShare IP Help from the Help menu within any AppleShare IP administration program, or by double-clicking the AppleShare IP Help icon in the AppleShare IP 6.1 folder.

If you are using Remote Admin, see AppleShare IP Remote Help. To access Help while you are using the Remote Admin application, click the Help link at the bottom of any Remote Admin page in your Web browser. You can also double-click the AppleShare IP Remote Help icon in the AppleShare IP 6.1 folder.

For recent downloads, refer to the Apple Downloads page at http://www.apple.com/support/downloads/ and search AppleShare IP.

Mac OS 8, 9: More Time Servers For Date & Time Control Panel

This article lists other time servers that can be used with the Mac OS 8 and 9 Date & Time control panel.
This article has been archived and is no longer updated by Apple.
The US Naval Observatory has definitive information on time servers at: http://tycho.usno.navy.mil/ntp.html

Public NTP Time Servers are divided into stratum 1 and stratum 2 servers. Further information on their usage can be found at:

http://www.eecis.udel.edu/~mills/ntp/servers.html

The National Institute of Standards and Technology (NIST), an agency of the Department of Commerce maintains several Time servers across the USA.

NIST Network Time Servers		
Name	**IP Address**	**Location**
time-a.nist.gov	129.6.16.35	NIST, Gaithersburg, Maryland
time-b.nist.gov	129.6.16.36	NIST, Gaithersburg, Maryland
time-a.timefreq.bldrdoc.gov	132.163.135.130	NIST, Boulder, Colorado
time-b.timefreq.bldrdoc.gov	132.163.135.131	NIST, Boulder, Colorado
time-c.timefreq.bldrdoc.gov	132.163.135.132	NIST, Boulder, Colorado
utcnist.colorado.edu	128.138.140.44	University of Colorado, Boulder
time.nist.gov	192.43.244.18	NCAR, Boulder, Colorado
nist1.datum.com	209.0.72.7	Datum, San Jose, California

How to Add a Time Server to the Date & Time control panel

1. Open the Date & Time control panel
2. Check "Use a Network Time Server".
3. Click the "Server Options" button.
4. Select Edit List from the Network Time Server menu.
5. Click the Add button in the Edit Server List window.
The Add window appears.
6. Enter the location from above into the Descriptive Name field
7. Enter either the name or IP address into the Server Address field.
8. Click the "Add" button to complete the entry.
9. Select a Time Server in the list.
10. Click the "Done" button in the Edit Server List window.

Your computer is now ready to set the time using a Time Server.

How to Activate the Time Server Option

1. Click one of the first two radio buttons for a periodic time update for your Macintosh, or to set the time immediately, click the third radio button "Set Time Now".
2. Click the "OK" button to complete the Server Options window.

AppleWorks for Windows: Importing Pictures Changes Bit Depth

When I import a 24-bit image in AppleWorks for Windows when the color is set to 8-bit (256 colors), the image is dithered to 256 colors. When the document is saved and opened with the color set to 24 or 32-bit, the image still appears to be only 256 colors. Can you help?

Note: AppleWorks is the new name for ClarisWorks.
This article has been archived and is no longer updated by Apple.
AppleWorks for Windows does indeed change the color depth of imported graphics. To work around this, set the color depth to the maximum before importing pictures. The image will be imported with correct bit depth. The image will be dithered on those systems with smaller bit depths but will display properly on systems with matching or greater bit depths.
Published Date: Feb 20, 2012

Drive Setup: Checking For Bad Blocks

Does the Apple Drive Setup program re-map the hard disk to set aside bad or unusable sectors like a low-level format, or does it simply set up blocks and mark them all as available?
This article has been archived and is no longer updated by Apple.
Drive Setup reallocates (spares) bad blocks on all SCSI and Ultra-Wide Apple hard drives only. You must select Test Disk or initialize the drive with the write zero option selected. Selecting the low level format option however, results only in the drive rewriting the header.

Erasing the data portion of each block.

The SCSI low level format option does not verify, and thus does reallocate bad blocks. Choose low level format carefully as any difficulties encountered once the format begins can prevent use of the drive. Specifically, power failure, or otherwise interrupting the drive before format is complete may cause the drive to appear as unusable. To remedy this situation, you must run Drive Setup and initialize with the low level format option selected and allow the format process to complete. As a rule, use initialization with only the write zero option selected followed by Test Disk to achieve the best level of block data integrity.

ATA (IDE) drives internalize tracking and sparing of bad blocks. Drive Setup and ATA drivers thus have little control over this process. Which is why the low-level format option is dimmed when initializing an ATA (IDE) hard drive. Reallocation (sparing) of bad blocks that the ATA drive tracks will occur when the block is subsequently written to. Thus the best way to force the drive to reallocate bad blocks is to initialize using the write zeros feature. Use Test Disk to verify surface integrity only. Given this strategy, there on occasion may be a need to initialize using write zeros, verify using Test Disk and if any errors occur, attempt to reinitialize using write zeros again.

Selecting initialize without selecting either low level format, write zeros or both for an SCSI drive, or without selecting write zeros for an ATA drive will only write zeros to the first 1000 blocks of the drive. It will also write the partition map area including drivers (generally blocks 0 through 700), and in cases of Mac OS Standard or Mac OS Extended partitions, call on the operating system to initialize each volume and write the appropriate volume information.

Test Disk performs only a read-only test of all blocks. You should not rely on Test Disk to force reallocation of bad blocks on ATA drives.

iMac: Firmware Update Message Keeps Showing At Startup

I just installed the iMac Firmware Update on my iMac and now every time I start up my computer, I get a message "Your iMac's firmware is up-to-date." What is happening, and what can I do about it?
This article has been archived and is no longer updated by Apple.
Typically the iMac Firmware Updater will place a copy of itself in the "Startup Items" folder before it updates the firmware. Upon restarting, the update will launch again. If the firmware has been updated, the following message will appear.

Figure 1: Dialog box noting iMac firmware update.

After clicking OK, the application will automatically move itself to the trash.

The behavior you describe results from the application not being moved to the trash. In that case, the dialog will appear every time the computer is restarted.

Evidently, there is a file or folder named "iMac Firmware Updater" in the trash.

Solution

To make the dialog quit appearing, simply empty the trash or remove the file named "iMac Firmware Updater" from the Startup Items folder.

Power Macintosh G3: Error -2004 When Playing System Sounds

I am getting the error message -2004 when double-clicking system sounds on a Power Macintosh G3 Desktop or Mini Tower computer when the system is started up from the system CD, even if double-clicking on system sounds contained in the System Folder on the CD. What is causing this to occur?

This article has been archived and is no longer updated by Apple.

This can occur if the personality card in the computer has become unseated. Once the personality card is reseated properly (following all appropriate safety precautions), the error should go away and the system sound should operate properly. If you hear no sound after reseating the card, try these things (in order):

- Check all external speakers/headphones as possible sources of the problem.
- Check the speaker connection to the logic board. (An Apple Service Provider may need to do this for you.)
- Replace the speaker. (An Apple Service Provider will likely have to do this for you.)

Apple Modem Update 1.3: Read Me

Apple Modem Update, version 1.3, was released on December 23, 1998. It requires the internal modem that came with the PowerBook G3 or iMac computer. This software consists of a self-mounting Disk Copy compressed image (.smi) file. Download this software to your hard drive and then double-click it to use it. You do not need Disk Copy to access .smi files. The software can be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates.
This article has been archived and is no longer updated by Apple.

Important Information About the Apple Modem Updater

This updater supports the internal modem which came with your PowerBook G3 Series or iMac computer.

Your existing modem was originally shipped with the latest firmware available, however, 56K modems are still in their infancy and will be undergoing changes over the next several months. If your modem supports only the K56flex protocol (shipping in the first PowerBook G3 Series computers) or if you are experiencing unreliable connections on your V.90 internal modem, Apple recommends that you upgrade your modem firmware. The Apple Modem Updater installs the latest Rockwell firmware, based on version 2.2.

Updating Your Modem

Before updating your modem, make sure the modem and modem port are not in use. Turn Fax Answering off and log off any open Internet/modem connections. (Disconnecting the phone line will also work.)

IMPORTANT Do not cancel the installation process once you start updating. This modem updater takes approximately five minutes to complete.

To update your modem firmware:
1. Double click on the icon Apple Modem Updater.
2. Click Start. Status messages appear as the updater locates the modem and checks for the current firmware version and type of modem.
3. Click Done when the update is complete.
You do not need to restart your computer after updating the modem firmware.
4. If you already installed a V.34 modem script, open the Modem control panel and select:
-- PowerBook G3 Internal 56K (for PowerBook G3 Series users)
-- iMac Internal 56K (for iMac users)
Note: This script forces the V.90 modem to connect at V.34 speeds and was necessary if you had problems connecting in V.90 mode.

If you experience a problem with the Apple Modem Updater, shut down your computer. This resets the modem. Then update the modem firmware again. Restarting the computer will not work; it must be shut down to reset the modem.

If V.90 connection reliability issues still exist after updating the modem, reselect the V.34 modem script.

If the problem still exists, see Apple's support web site (http://www.apple.com/support/) for up-to-date information on the Apple Modem Updater.

Future Modem Firmware Updates

New firmware updates may continue to be released for 56K modems until the technology stabilizes. For more information on V.90 modem upgrade information, see Apple's support Web site: http://www.apple.com/support

Additional information regarding this update is available in Knowledge Base article 24773: "**Modem Updater: Revised Read Me**"

Published Date: Feb 20, 2012

Apple Modem Update 1.3: Revised Read Me

This article contains additional information regarding the Modem Update 1.3 software.
This article has been archived and is no longer updated by Apple.
Revised Apple Modem Update 1.3 Read Me

If your modem supports only the K56flex protocol (shipping in the first PowerBook G3 Series computers) or if you are experiencing unreliable connections on your V.90 internal modem, Apple recommends that you upgrade the modem firmware. The Apple Modem Updater installs the latest Rockwell firmware, based on version 2.2. For additional information, please see the Read Me included with this software.

Which version of the Apple Modem Updater 1.3 should I use?

If the modem was purchased in:

- United Kingdom - use the UK version
- France - use the FR version
- Germany - use the DE version
- Any country other than: France, Germany, the U.K., The Americas (North, Central, and South), Hong Kong, Taiwan, Singapore, and Japan - use the Z version
- The Americas (North, Central, and South), Hong Kong, Taiwan, and Singapore - use Apple Modem Updater 1.2.1

IMPORTANT INFORMATION NOT CONTAINED IN THE ORIGINAL READ ME:

Modem performance:

After you have updated the modem you may notice that the connection speed that is reported when you first establish a connection may be lower than it was prior to the upgrade, however the modem throughput will be at least as good and often better than before the upgrade. Throughput is the measure of how quickly a certain amount of data is transferred from one modem to another. It is important to remember that the connection speed that is reported is only the initial connection speed. The modems will adjust their communications speed as line conditions require. A faster connection speed does not necessarily indicate a higher throughput, factors like resending data due to noise on the phone lines will lower overall throughput. This is discussed in more detail in the following Knowledge Base articles:

Article 30734: "**V.90 Protocol: Connectivity Discussion**"
Article 24482: "**A56Kbps Modems: Getting The Fastest Connection**"

PowerBook G3 Series:

When you are updating a modem in a PowerBook, connect the PowerBook to the AC adapter to guarantee an uninterrupted supply of electricity to the PowerBook.

PowerBook G3 Series Modem Extension, v 1.0.2

The PowerBook G3 continues to supply power to the built in modem for 30 seconds after an application has used the modem. This minimizes the time it takes to start the next connection.

With version 1.0 of the modem extension, if the PowerBook G3 is put to sleep immediately after terminating a connection, the modem will continue to draw power which reduces the amount of charge left in the battery.

Version 1.0.1 corrects this problem by turning power off to the modem when the PowerBook G3 is put to sleep.

Version 1.0.2 replaces version 1.0.1 and includes the following fixes:

- Changes the sound monitor source to 'None' while powering the modem on or off in order to prevent the 'pop' sound.
- At close time, restores the sound monitor source to whatever it was at open time, unless the user has changed it in the meantime.
- Improves power on/off and reset strategy to recover from possible modem error conditions.

All PowerBook G3 Series computers with the Apple built in modem should upgrade to version 1.0.2 of the modem extension which is available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Installation:

1. Drag the PowerBook G3 Series Modem extension on top of the System Folder.
2. You will be informed that extensions need to be placed in the Extensions Folder. Click OK.

3. You will be informed that an extension with the same name already exists in the Extensions Folder. Click OK to replace the existing extension.*
4. Restart the PowerBook.

* If the name of the existing modem extension is not exactly the same as the name of the newer extension it will not be replaced by the newer extension as indicated in step 3 above. If you do not see the dialog described in step 3, please manually drag the older modem extension out of the Extensions folder and onto the Desktop. This will guarantee that the newer modem extension will be used. The older extension may be deleted after the PowerBook is restarted.

Communicating at an unknown rate:

If your modem originally supported only the K56flex protocol (shipping in the first PowerBook G3 Series computers), the original modem script (CCL) does not include all the possible V.90 rates. Updated and localized modem scripts will be posted in the future. The Z version of the Apple Modem Updater 1.3 contains US-English V.90 modem scripts that can be used in the interim.

Remote Access: Using the Terminal Window to Send AT Commands

This article describes how to configure Remote Access for sending AT commands from the terminal window.
This article has been archived and is no longer updated by Apple.
1. Open the Modem control panel and choose one of the Null Modem scripts as shown in Figure 1.

Figure 1 The Modem control panel configured for Null Modem

2. Close the control panel and save the changes when asked.

3. Open the Remote Access (or PPP) control panel and enter any name and number as shown in Figure 2. A password is not required. There's no need to change any information already entered there.

Figure 2 Remote Access control panel

4. Click the Options button and configure the Protocol pane to enable "Connect to a command-line host" and "Use terminal window," as shown in Figure 3.

Figure 3 Remote Access Options window

5. Click OK, then click Connect in the Remote Access window. A terminal window will appear, as shown in Figure 4. AT commands can be entered here.

Figure 4 Remote Access PPP Terminal window

6. Click Cancel when finished.

iMac Update 1.1: Misidentified With Apple System Profiler 2.1.2

I have encountered a few difficulties since installing the iMac Firmware Update and the iMac Update 1.1. Thinking that they may be associated with one of the updates, I used the Apple System Profiler to check the version numbers and it appears that Mac OS ROM version is not as recent as the one that was previously installed. Should I put the older Mac OS ROM file back?
This article has been archived and is no longer updated by Apple.
First, Apple does not recommend going back to the previous Mac OS ROM file.

Your confusion results from the incorrect information being displayed in the Product Information section of Apple System Profiler 2.1.2.

Mac OS ROM file version as seen in Apple System Profiler 2.1.2 under Production Information:

```
iMac Update 1.0     1.1.5
iMac Update 1.1     1.1b2
```

This is not correct.

Use the information found in About This Computer or the Get Info box for the Mac OS ROM file to see what it should say.

After installing the iMac Update 1.1, About This Computer states that the Mac OS ROM file is version 1.2.1.

You can also use the USB section of "Devices and Drivers" of Apple System Profiler. If you have the iMac Update 1.1 installed the USB version will show up as 1.1. If you see 1.0.1 or 1.0, then you have an older Mac OS ROM file on your iMac and should install the update.

iMac: Bundle Info Available In Hard Drive "Get Info"

When I get "Info" on my iMac hard drive, I have noticed the following number in the "Comments" window: `694-1108`. What does that mean?
This article has been archived and is no longer updated by Apple.
That number identifies the software bundle that came with your computer. This numbering system is being used on all Macintosh computers at this time. Here is a chart that lists the software bundle number associated with each iMac release.

Configuration	Software Bundle
Original iMac (/A version)	694-1108
Original iMac (/B version)	694-1134
iMac 266	694-1155

The Apple System Profiler also provides this information in its Product Information section, listed under "Bundled Software".

No Modem Dial Tone Due to Voice Mail System

This article describes a situation where phone company based voice mail systems may interfere with the operation of an internal modem.
This article has been archived and is no longer updated by Apple.
Some telephone companies use an audible message waiting indicator or a stutter tone that you hear when you pick up the phone. The stutter tone will prevent your modem (including the iMac's) from detecting the dial tone.

There are three possible workarounds:

- Check your voice mail before attempting to use the modem. The stutter tone should go away and the modem will operate as designed.
- Delay the dialing until after the stutter tone by adding a comma or two in front of the telephone number. This will cause the modem to pause long enough to allow the stuttering to complete. (A comma tells the modem to wait one second. Hence, three commas will cause a three-second delay.)
- Selecting "ignore dial tone" in the Modem control panel. This will allow the dialing to proceed without the modem listening for a dial tone.

In the case of America Online (AOL) and other PPP dialing applications, the Modem control panel is not used. A more advanced workaround may be required. For example, adding the AT command "X1" in the initialization string will enable blind dialing which is the same as "ignore dial tone." AOL users should check with AOL support for additional recommendations on this issue.

If you do not have voice mail on your phone line, plug in a regular phone to the jack that your modem is using and try dialing. You could have lost service to the jack, in which case you need to contact your telephone service provider.

iMac and iBook: World Book Encyclopedia Serial Number

When trying to install the World Book Encyclopedia software that came with my new computer, the installer tells me to type in the serial number, and states that the serial number is located on the back of the package that the CDs came in. Where can I find this serial number?
This article has been archived and is no longer updated by Apple.
Note: This issue does not apply to Rev. A or Rev. B iMac computers.

During the installation for the World Book Encyclopedia software, the installer program will pause for you to enter the 12-character CD-Key code. The regular instructions ask the user to look for the CD-Key code on the back of the disc holder containing the World Book discs.

For the iMac bundled version, the CD-Key code may be on the back of the "World Book Macintosh QuickStart" card that comes inside the accessory kit box of your iMac, or on a label affixed to the CD sleeve itself.

Input all the letters and numbers without hyphens or spaces; capitalize all letters.

If you experience problems installing or using World Book * Macintosh Edition, first consult the Read Me file located in the World Book folder on the hard disk; and then if necessary visit World Book's Web site, which can be found at this address:

http://www.worldbook.com

Adobe Premiere: Sync Problems When Exporting Using DV Plug-in

When I export an Adobe Premiere project using the Apple DV Export plug-in, the resulting audio and video do not stay in sync. Why is this?
This article has been archived and is no longer updated by Apple.
The DV Export plug-in is designed to take a completed movie and export it to a camera or deck. To maintain synchronization, first export the project as a DV movie, then open the movie in Premiere, and send it to the camera or deck using the DV Export option.

The lowest supported version of Adobe Premiere is 4.0.2, however Apple recommends using version 5.x or higher.

Note: The Apple DV Export plug-in for Adobe Premiere is not supported with QuickTime 4 or later.
Published Date: Feb 20, 2012

Digital Video: Movies Look Bad When Played Back on Mac and/or TV

Sometimes when I play back a digital video (DV) clip that I captured with my DV camera, it appears blotchy, blocky, out of focus, and the colors are washed out. Why is this?
This article has been archived and is no longer updated by Apple.
Reason: The process of decoding DV data, even over FireWire, requires large amounts of data and many computations. To maintain frame rate and view the movie at a normal size, only about one-fourth of the DV data is used in displaying the movie to the screen. However, the underlying DV data is still at full quality.

Computer Display Solution: The QuickTime Pro-enabled QuickTime Player can be used to display a DV movie at High Quality. To do this, open the movie with QuickTime Player, and select Get Movie Properties from the Movie menu. In the Movie Info window, select Video Track in the left popup menu, and select High Quality in the right popup menu. Check the High Quality Enabled checkbox to view the movie at full quality.

Frame rate will decrease substantially with this setting. The movie can be saved with this setting and from then on, when the Movie is played back in any application, it will be played at High Quality.

In order to maintain full frame rate during the editing and playback of DV clips, Final Cut Pro, iMovie, and other QuickTime-based applications typically default to using Low Quality. The important thing to remember is that Low Quality is strictly a **playback** mode for computer monitors, and does not affect the quality of the DV image that is sent out through FireWire to the DV device or NTSC monitor. The Apple FireWire output is always High Quality.

Note: NTSC is a set of standard protocols for television (TV) broadcast transmission and reception in the United States.

NTSC Monitor Solution: If you are using a NTSC monitor to view the DV video during capture, you should see full-quality, full-frame rate video. However, if the video is choppy on the NTSC monitor you can determine if this choppiness is cosmetic or a symptom of actual frame loss. To determine this import the clip, then export the clip to tape and view it on a NTSC monitor. If the video is still jumpy on the NTSC monitor turn off AppleTalk and TCP/IP.

Note: If you are using iMovie and you have 64 MB of RAM, enable virtual memory in the control panel. When using iMovie with more than 64 MB of RAM, virtual memory should be disabled.

Other items that can cause choppy, jittery, or what may appear as dropped frames during video capture/playback:

- conflicts with third party DV extensions and Apple's FireWire extensions
- capturing to a volume connected via FireWire
- conflicts with hard disk configuration/formatting software
- corrupt Final Cut Pro or iMovie Preferences
- overlapping windows within Final Cut Pro

If these steps do not help then be sure to run through basic troubleshooting steps such as:

- Disk First Aid
- extension isolation
- remove and reinstall software

Troubleshooting "No Dial Tone"

This article explains how to troubleshoot a modem that cannot detect or acquire a dial tone.

Note: While this article specifically mentions iMac computers, it is equally applicable to the PowerBook G3 Series (Bronze keyboard) and Power Macintosh G3 (Blue and White) computers because they use a variation of the same modem.
This article has been archived and is no longer updated by Apple.

Symptom

When the modem cannot detect or successfully acquire a dial tone, the connection attempt fails, and Remote Access responds with this message:

Figure 1: ARA dialog

Or, when using America Online 4.0:

Figure 2: Connection warning

Solution

Use the troubleshooting path in this article to identify the source of the issue.

(If Open Transport/PPP is installed, substitute "PPP control panel" for "Remote Access control panel" throughout these instructions.)

Step One

Don't Confuse a No Dial Tone Error With a Silenced Modem

The audio feedback of some Apple internal modems, including those in iMac and Power Macintosh G3 (Blue and White) computers, is passed through the computer's speakers. If the speaker volume is turned off, you cannot hear if the modem is able to detect and acquire a dial tone.

Turn the computer volume up in the Sound Volume portion of the Control Strip, the Sound control panel, or the Monitors & Sound control panel. Increasing the volume automatically deselects Mute in the Sound, or Monitors & Sound control panel.

Figure 3: Control strip

Step Two

Verify Physical Connectivity

a. Check the telephone line connection at the wall outlet and the modem. For computers with internal modems, ensure the line is not connected to the Ethernet port (if available) by mistake. Push firmly in on the connectors at both ends, or disconnect and reconnect them, to seat them securely.

Figure 5: Modem port

b. External modems provide an additional jack for connection to a telephone. Do not connect the line from the wall outlet to this jack, which is often identified by an icon of a telephone (see Figure 6).

Figure 6: Icon representing the wrong modem jack for a modem-to-wall connection

Note: Most analog modems do not work with digital/PBX phone lines. If an ordinary residential consumer telephone works in the same outlet, it is a compatible analog line.

Step Three

Set Up the Modem Control Panel

Set up the Modem control panel to use the appropriate modem script. Apple internal modems use these scripts, by computer:

Computer	Modem Scripts
Power Macintosh G3 (Blue and White)	PowerMac G3 Internal 56K, Power Mac G3 Int56K (v.34 Only)
PowerBook G3 Series	PowerBook G3 Internal 56K, PowerBook G3 Int56K (v.34 Only)
iMac	iMac Internal 56K, iMac Internal 56k (v.34 Only)
Power Macintosh G3	Apple/GV 56K
Power Macintosh 6500	Apple/GV 56K
PowerBook G3	PowerBook 3400/G3 Internal 33.6
PowerBook 3400	PowerBook 3400/G3 Internal 33.6
GeoPort Telecom Adapter (internal or external)	GeoPort/Express Modem

Figure 7: Modem control panel

Step Four

Configure the Remote Access Control Panel and Test

a. Open the Remote Access control panel. Enter a name (user ID), password, and telephone number.

Inaccurate entries do not prevent detection of a dial tone. However, if a prefix such as "9" must be dialed to reach an outside line, enter it before the telephone number, followed by a comma as shown in Figure 8.

Figure 8: Remote Access control panel

b. Click Connect and listen for a dial tone, number tones, or handshaking (squealing sound). If they are audible, or if the Status field shows "Starting PPP," "Starting network protocols," "Communicating at 24000 bps," or any other such indicator that appears after acquiring a dial tone, the issue is fixed.

c. If it is convenient to perform step 8 (test the line with a telephone), it may save some time to do so now. If it is not convenient, proceed through the steps in order.

Step Five

Disable Dial Tone Checking and Try Again

If the dial tone does not conform to what the modem expects to hear (because of poor signal level or quality, or non-standard frequency, for example) it may be difficult for the modem to recognize a dial tone. In such cases the modem software can be configured to assume that a dial tone is present without first checking for it.

a. Open the Modem control panel and click "Ignore dial tone", then close the control panel and save the changes.

b. Open the Remote Access control panel and click Connect, as in step 4. Watch and listen.

Important: Because "Ignore dial tone" is selected, you may only hear the number tones as dialing occurs, and not the dial tone or modem handshaking. The "modem is not responding properly" alert may then appear. If so, the problem persists.

c. Voice mail. Disabling dial tone checking may work around the issue posed by some voice mail services that use an altered dial tone, or a series of initial tones, to notify the user of waiting voice mail. If a voice mail service is enabled on the line and the problem persists, try entering one or two commas (,) before the telephone number in the Remote Access control panel. Each comma represents a pause of a few seconds. The idea is to delay dialing until after the voice mail tones have ended. If this works, it may not be necessary to leave "Ignore dial tone" selected in the Modem control panel, though doing so does not affect modem performance.

Step Six

Delete Preferences

Damaged Remote Access preferences may be at fault. Considering that Remote Access was able to successfully detect and initialize the modem prior to checking for the dial tone, the odds of this are very unlikely, but it is easy to confirm prior to the more time-consuming tasks ahead.

a. Move these two preference files to the desktop (or anywhere outside of the Preferences folder):

If you are using Apple Remote Access:

- System Folder : Preferences : Modem Preferences
- System Folder : Preferences : Remote Access : Remote Access Connections

If you are using Open Transport/PPP:

- System Folder : Preferences : Modem Preferences
- System Folder : Preferences : PPP Preferences

b. Repeat steps 3 and 4 to set up the control panels and test. If the symptom persists, the preferences were not at fault. To reclaim the configuration information they contained (optional), move them back to their original locations and allow them to replace the newer preference files that were created.

Step Seven

Hardware-Isolate the Line

Establish a point-to-point, one cable (the shorter the better) connection between the modem and the wall outlet, isolating the modem, the line, and the outlet from all other devices, including telephones, answering machines, fax machines, caller-ID boxes, cable extenders, line splitters, and so forth. Then retest as per step 4.

If that works, one or more of the removed devices was impairing the line quality (thus affecting the dial tone) or pushing an already poor line past the breaking point. It may be necessary to attach those devices to different outlets or experiment with other devices, cables, splitters, and combinations thereof. Sometimes the inside or outside home wiring is at fault, requiring a telephone technician to diagnose.

Step Eight

If possible, check the modem with Apple Hardware Test.

If the computer came with Apple Hardware Test (included with iMac (Summer 2000), Power Mac G4 (Gigabit Ethernet), Power Mac G4 Cube, or PowerBook (FireWire) computers), start up with the Apple Hardware Test CD-ROM disc and open the Quick and Extended tests. If the Apple Hardware Test detects a modem error, note the error code, and contact Apple or an Apple Authorized Service Provider.

Step Nine

Confirm That the Cable and Outlet Are Good

Disconnect the telephone cable from the modem (leave it attached to the wall outlet) and plug it into a telephone. Listen for a dial tone with the telephone handset. If it cannot be heard, there is a problem with the outlet or the cable. Try a different telephone cable and, if necessary, a different outlet.

It does not matter that a telephone used to work on the wall outlet at some earlier date, or that it worked there while using a different telephone cable. Unless the outlet and the cable were tested with a telephone just prior to connecting the modem to the same cable and same outlet, this must now be done.

Note: If you arrived at step 9 directly from step 4, continue troubleshooting at step 5.

Step Ten

Perform a Clean Installation or Clean Restore

The Mac OS may be unusable.

a. Perform a clean installation or clean restore of the operating system. If there is any connectivity software or modem drivers to be installed separately (GeoPort modems, for example, require the reinstallation of Apple Telecom), do so immediately afterward.

b. Repeat steps 3 and 4 to retest. If the problem continues, there may be a hardware issue with the modem.

Published Date: Feb 20, 2012

Mac OS: Maximum Number of Items in the Fonts Folder

This article lists the maximum number of items that can be placed into the Fonts folder for various versions of Mac OS, and explains how to work within the limits.
This article has been archived and is no longer updated by Apple.
Mac OS versions earlier than Mac OS 9 are limited to a maximum of 128 files in the Fonts folder. Mac OS 9 includes support for up to 512 files in the Fonts folder. "Files" include font suitcases and individual font files such as bitmapped (screen) or TrueType fonts. PostScript (or printer) fonts are not included in the file limit.

Suitcases can contain multiple font families and can be as large as 16 MB. If you have more files installed in your Fonts folder than the Mac OS limit allows, place individual bitmap or TrueType font files into suitcases, or merge suitcases. To create a suitcase, duplicate an existing suitcase and empty its contents. To merge suitcases, drag an existing suitcase file onto another suitcase file.

Do not store fonts within folders in the Fonts folder. Such an arrangement makes the fonts inaccessible to Mac OS.

Language Kits: Underlined Text Using Japanese, Chinese And Korean Fonts

This article explains how to underline text while using fonts from the Japanese, Chinese, and Korean language kits.
This article has been archived and is no longer updated by Apple.
The ability to display and print underlined 2-byte (Japanese, Chinese and Korean) characters is actually handled by the Mac OS. This feature was introduced in Mac OS 8.5. The following 2-byte Language Kits are supported by Mac OS 8.5:

- Japanese Language Kit 1.2
- Chinese Language Kit 2.0 or 1.2
- Korean Language Kit 1.0

For more information on using Apple's Language Kits with Mac OS 8.5, please see the following Tech Info Library article:

Article 24799: "**Language Kit Updater For Mac OS 8.5 Read Me**"
Published Date: Feb 20, 2012

AppleShare IP 6: Windows Client Troubleshooting

This article is a discussion pertaining to the troubleshooting of Windows File Sharing connections with AppleShare IP 6. A detailed discussion of AppleShare IP Windows File Sharing may be found in the following article:

Article 24448: "**AppleShare IP 6.0: Using Windows File Sharing Feature**"
This article has been archived and is no longer updated by Apple.
The following steps may be used to setup and troubleshoot Windows clients connecting to an AppleShare IP 6 server.

Mac OS Server TCP/IP Configuration

The TCP/IP control panel should be defined as: Connect via: Ethernet and Configure: Manually. The IP range 11.1.1.1 may be used on single domain networks not connected to the Internet. If your server is connected to the Internet, consult with your ISP about obtaining a dedicated IP address range for your network.

AppleShare IP 6 Web and File Admin

In the AppleShare IP 6 Web and File Admin application, enable both TCP/IP and SMB connectivity.

Under the AppleShare menu, in the Web and File Server Settings window, select the option to "Enable File Server Clients to Connect over TCP." Next, under the Windows File Sharing menu, select the option to "Enable Windows File Sharing (SMB)." Make sure that you have chosen a compatible Server Name (15 or fewer and no special characters), as well as the appropriate workgroup name and description.

Tip: Some users have found success with using the IP address of the server as the server name. This prevents entering the incorrect server name from the Windows client. This approach is practical for networks with one ASIP server, but may be confusing on networks with multiple servers.

Windows Network Control Panel Configuration (Properties)

Open the Network control panel from the Start menu: Settings: Network control panel **or** right click on the Network Neighborhood icon on the desktop and select Properties from the pop-up menu:

Adapter: Use the appropriate ethernet adapter for your computer (for example,NE2000 Compatible). Use the Bindings tab to ensure that the TCP/IP protocol is bound to the adapter.

Protocols: Microsoft TCP/IP. Use the Bindings tab to ensure that Client for Microsoft Networks is bound to the Microsoft TCP/IP protocol.

Client: Client for Microsoft Networks.

Service: File and printer sharing for Microsoft networks. Make sure that that Browse Master is set to "enabled" if this is the only PC in the domain.

Windows Network Control Panel Identification

In the Network control panel, under the Identification tab, the computer name should be the name that you use to both logon to the Windows computer at startup and the name of the Windows client account on the AppleShare IP server.

To prevent identification or authentication issues, the Computer Name, TCP/IP Host Name and AppleShare IP client account name should be the same. If an authentication error does occur, the client may continue to log in as "guest" with no feedback to the user.

Unless a named network workgroup already exists, the default workgroup name "Workgroup" should be used, or the workgroup name entered in the AppleShare IP Web and File Server Settings.

Connecting to an AppleShare IP Server

Using a Windows 95 client, for example, you can click on the Start icon and choose Find: Find Computer, then enter the name of the server. It is important that this name exactly matches the name entered in the Web and File Server Settings.

If this is a server that will be mounted frequently, create a shortcut to the server volume for access from the Windows desktop.

Note: The Map Volume feature in Network Neighborhood may be used to assign a drive letter to the network volume. Mapping a network volume will also allow you to Find and Save from common Windows dialog boxes.

Note: Due to the length of time between SMB updates, it may take up to an hour for a network volume to appear in the Network Neighborhood window.

Troubleshooting Notes

AppleShare IP Web Sharing may be used to test TCP/IP connectivity. The DOS Ping utility found under the Start Menu can be used to ping the ip address of the AppleShare IP server. The Windows client web browser may also be used to test connectivity, as well as the Windows client account on the ASIP server.

Windows PC Peer-to-Peer File Sharing or Macintosh SMB Client may be used to test communication within the workgroup. If you have another PC in the workgroup, you can verify that SMB file sharing is operating properly by file sharing to another PC. SMB file sharing clients for the Mac OS such as Dave from Thursby Systems may also be used to verify SMB communication.

An LM Hosts file is a static method of resolving domain names when the client and server are in different network segments or subnets. To use the LM Hosts file, first make a copy of the LM Hosts file to retain the original sample copy. The LM Hosts file contains text describing the proper syntax and usage. Because the LM Hosts file is a static method for resolving host names, changes will need to be entered manually for host name resolving to function properly.

Windows NT Server can provide WINS Registration (domain name services) for Windows clients connecting across network segments. However, the Windows client option to "Enable WINS Registration" is off by default. Also, Mac OS TCP/IP services do not recognize WINS Registration as a way to resolve host names. As an alternative, MacDNS or other third party solutions offer an "industry standard" method of resolving names.

Apple Remote Access: Disconnects After Ten Minutes

Every time I connect to my Internet service provider(ISP) Apple Remote Access disconnects me after about ten minutes. Why is this happening?
This article has been archived and is no longer updated by Apple.
There is an option in the PPP application that automatically disconnects services when the dial up services are idle for a designated period of time. This feature saves long distance telephone charges or reduces idle use of PPP server telephone lines.

If you don't need this feature active it can be turned off in Apple Remote Access. Other dial up applications may have a similar option. Here is how to change the setting in Apple Remote Access:

1. Open the Remote Access control panel.
2. Select the "Options..." button.
3. Uncheck the reminder "disconnect if idle for ten minutes."

Published Date: Feb 20, 2012

Troubleshooting Phone Line Issues That Affect Modem Connections

This document provides information for troubleshooting possible issues with phone line quality that may affect your dial-up modem connection.
This article has been archived and is no longer updated by Apple.
This document focuses only on line phone line quality, not modem troubleshooting as a whole. For a complete modem troubleshooting strategy, see these technical documents:

106748: "**Mac OS X: Troubleshooting a Dial-Up/PPP Internet Connection**"
106871: "**Mac OS 8, Mac OS 9: Troubleshooting a Dial-Up/PPP Internet Connection**"

When using a dial-up modem, it should be considered normal if you occasionally lose a connection, given the nature of phone lines and typical operating conditions. An "unreliable" connection would be when disconnects occur more frequently, often shortly after the connection has been established.

Important: Be sure you are not perceiving the "disconnect if idle" feature as a phone line issue. The "disconnect if idle" feature allows you to specify that your modem will automatically disconnect when you do not use it for a certain number of minutes, thus freeing the line for use by others. If the disconnect always occurs after a specific interval of time (such as 10 minutes), or only after a period of inactivity, you may simply need to adjust this setting. Additionally, your Internet service provider may have its own "disconnect if idle" setting, which is beyond your control. If you seem to be disconnected after a fixed interval, then you should ask your Internet service provider what its idle disconnection policy is. The following steps describe how to check your idle disconnect setting.

Mac OS 8 and 9

1. Open the Remote Access control panel (or PPP control panel in some earlier versions).
2. Click the Options button.
3. Click the Connection tab (see Figure 1).
4. Click the "disconnect if idle" checkbox to disable it if necessary, or enter a larger number.

Figure 1: Remote Access control panel options--Connection tab.

Mac OS X:

1. Open System Preferences.
2. Click the Network icon.
3. Choose Internal Modem from the Show pop-up menu (the Configure menu prior to version 10.1).
4. Click the PPP tab.
5. Click the PPP Options button.
6. Click the "disconnect if idle" checkbox to disable it if necessary, or enter a larger number.

Once you have verified that the "disconnect if idle" feature is not the cause of your disconnects, you should troubleshoot your phone line.

Checking for phone line interference and distortion

The telephone network path between modems must be sufficiently free of noise and frequency distortion to permit a stable connection. The modem analyzes these line impairments as they affect the quality of the transmission signal. Poor signal quality causes transmission errors, reduced throughput, reduced connection speed, and dropped connections.

a. Experiment with eliminating potential sources of line impairments in the home:

- Any device connected to any telephone outlet, especially if used by the modem, and even if on a different line: telephones, including cordless telephones and their base stations, answering machines, fax machines, caller ID boxes, and other modems
- Telephone line splitters, cable extenders, faulty or overly long telephone cables (shorter is better)
- Surge protectors, including those that offer telephone line protection
- Alarm systems, especially those that are connected to the telephone system
- Computer equipment, including speakers
- Fluorescent light fixtures and light dimmers
- Satellite dish receivers

- Appliances such as air conditioners, refrigerators, dryers, microwave ovens, and televisions
- Any AC power source and related cabling
- All other things electrical, including problems with the premises wiring: loose or corroded connections, too many splices or bridges, insulation deterioration and exposed wiring, non-twisted pair telephone wiring

Start with a direct, unobstructed, modem-to-outlet connection using a short, high-quality telephone cable. As a way of confirming the problem prior to isolating it any further, there is the option of testing with a direct connection to the external telephone box located at the back or side walls of the residence. It provides one or more standard telephone jacks supplying the home telephone connections but bypassing most impairments inside.

b. Listen for noise. Because the telephone company is only obligated to provide voice-quality phone lines, it is unlikely to address the many and varied off-premises sources of line impairments that can affect the connection but don't cause audible noise. Connect a telephone to the wall jack used by the modem, then pick up the line, dial the number 1 to stop the dial tone, and listen. Contact the telephone company if the line is not quiet (loud hiss, pops, static, voices), but first disconnect other telephone devices and check again.

c. Use a local dial-in number to your Internet Service Provider. Long distance and 800 numbers aren't typically a concern, but may cause the call to be routed through more facilities, indirect paths, and different carriers with different types of equipment and lines. Local calls may be auto-forwarded in the same manner, but most reputable ISP's don't engage in this practice.

If daunted by these varied and uncertain possibilities, consider carrying the computer to a local Apple service provider for testing on analog lines of confirmed quality.

Claris Software: Compatibility With Windows 98

Are any of the former Claris software titles, that Apple supports, compatible with Windows 98?

Note: AppleWorks is the new name for ClarisWorks.
This article has been archived and is no longer updated by Apple.
The only former Claris product that Apple has tested with Windows 98 is AppleWorks 5.0.3.

All of the others are certified for Windows 95, but not for Windows 98. Using the most recent version of an application may be worth a try, but it would be strictly at your risk.

There are no plans to certify any of these (formerly) Claris titles for Windows 98.

Modems and call waiting

I have the Call Waiting service offered by my local phone company. How can my modem be affected if I am using call waiting and someone tries to call me?
This article has been archived and is no longer updated by Apple.
If you have Call Waiting, an incoming call can interrupt your modem connection. If this happens, you may hear a slight "click" or "pop" sound as the modem disconnects. Shortly after, your phone may begin ringing.

If you know that Call Waiting is enabled on the telephone line used by the modem but have not taken steps to disable it when dialing out, enter `*70,,` before the telephone number. If your line requires pulse dialing, use `1170,,` instead. (The extra comma, signifying an additional pause, is optional but occasionally necessary to allow the command sufficient time to be acknowledged.) Call waiting will be disabled only for the duration of the current connection.

Tip: Your local telephone company may require different numbers or may not automatically provide this feature. Check with your telephone company.

In special circumstances, such as when expecting an important call, one might wish to have the current modem connection drop to allow the incoming call to be answered. In such cases, you will need to enable Call Waiting by removing the `*70,,` (or `1170` if using pulse dialing) preceding the phone number.

It should be noted that due to various modem designs, phone line quality and many other technical variables, your modem may not necessarily drop the connection when an incoming call arrives.

Tip: The number sequence used to disable call waiting may vary between countries and regions. In some areas, the numbers used may connect you to a recorded message confirming the disabling of call waiting. In this case, including the numbers as part of the dialup number may prevent you from connecting to your ISP. As a workaround, enter the call-waiting-disable digits on the handset of a regular phone, then use the modem to connect to your ISP.

iMac: Troubleshooting Address and Illegal Instruction Errors During Startup

This article discusses Mac OS 9 and older address errors or Illegal instruction errors that occur during startup and how to help prevent them.
This article has been archived and is no longer updated by Apple.

What causes this error?

- damaged hard disk driver
- damaged or incompatible extension
- damaged Finder
- damaged System file

Note: When troubleshooting address errors, make sure the Install or Restore CD is **not** in the drive during startup. If the install or Restore CD is in the drive, the address error might be eliminated. However, after the disc is ejected and the computer restarted, the problem will reoccur.

Solutions

1. Start up with the Shift key down; this disables system extensions.
If the computer starts up and displays the desktop, the problem is not with the Finder or System file but likely with an extension in the Extensions folder within the system folder. Use the Extensions Manager control panel to selectively enable extensions to determine which is causing the problem. Once the problem returns, delete and reinstall the last extension that was enabled.

2. Next, try starting up into the Extensions Manager (hold the Space Bar down and start up the computer).
When the Extension Manager window appears, select the "Mac OS 8.x All" set of extensions and allow the system to continue starting up. If that fixes the problem, then you know the problem is an extension conflict.

3. If the error still occurs, the next thing you should try is starting up from a different source, such as the iMac install CD or any other bootable system software volume.
If the computer starts up properly from the CD (or other startup volume), then you can be confident that the computer does not have a hardware problem.

4. The next thing you should try is updating the hard disk driver using Drive Setup.
After updating the hard disk driver on the suspect hard disk, try restarting. If the computer still exhibits the problem continue with the steps below.
For more specifics on the hard disk driver, please see Knowledge Base article 24585: "**Hard Disk Driver: Identifying It And Ensuring Compatibility**"

5. Consider resetting Parameter RAM (PRAM); sometimes the issue can be resolved by performing this procedure.
For instruction on resetting Parameter RAM, please see Knowledge Base article 2238: "**Macintosh: How To Reset PRAM And NVRAM**"

6. If the computer started up and ran properly from a different volume (as described in step 3 above), and the computer still exhibits the problem then the last step is to perform a clean install of the system software.

Mac OS: Generic Alias Icons And CD-ROM Discs

I want to keep several aliases of different CD-ROM games in my Launcher window without actually installing the software on my hard drive.

If I insert a CD-ROM disc, make an alias of one of its games, eject the CD-ROM, and restart, the alias reverts to a generic icon and will not ask for the CD-ROM disc if I click on it.

I have rebuilt my desktop, but the icon remains generic. What should I do?
This article has been archived and is no longer updated by Apple.
The issue is currently under investigation by Apple Computer.

Suggested workarounds:

- Install the software on your hard drive and make an alias.
- Copy the application to your hard drive and make an alias.
- Copy one of the application's documents (such as a game save file) to your hard drive, then create an alias to the application on the CD-ROM disc.
- Paste the original custom icon using Get Info. To do this:
    1. single-click on the original application.
    2. choose Get Info from the file menu.
    3. In the Get Info window, click the custom icon (upper left corner).
    4. select Copy from the Edit Menu.
    5. close the Get Info window.
    6. eject the CD-ROM disc or removable media.
    7. single-click the alias.
    8. choose Get Info from the file menu.
    9. In the Get Info window, click the custom icon (upper left corner).
    10. select Paste from the Edit Menu.
    11. close the Get Info window

The (invisible) Desktop Database files will not be updated to reflect the custom icon unless the original application (or a document belonging to the application) are present on the hard drive.

If the application or document is removed from the hard drive, the behavior may return.

Note: This issue may occur with Mac OS 7.6, 7.6.1, 8.0, 8.1, 8.5, and 8.5.1. Other removable media (including Zip disks or DVD-RAM discs) may exhibit this issue as well. System Software prior to Mac OS 7.6 may not exhibit this issue.

For more information on this subject, please see the following Tech Info Library articles:

Article 18727: "**Desktop Manager And Desktop Databases: What Are They?**"
Article 15200: "**Generic Icons: Applications On Removable Media**"

AppleShare IP: Server Enhancement Products

This article provides information about software and hardware products that work with AppleShare IP to provide enhanced or additional capabilities. Products are grouped by areas of functionality. Sales and support of these products are the responsibility of the vendor.
This article has been archived and is no longer updated by Apple.

Server Management & Administration

Security Suite, from Open Door Networks, Inc. includes an integrated set of components that provide additional security for your AppleShare IP server. Included within the software suite are DoorStop v1.0, AFP Logger v1.0, The LogDoor Real-time Server Monitor v2.2, and Documentation and examples. In additional Security Suite can provide enhanced security for your whole network. Refer to the Open Door Networks, Inc. site for more information on this product.

DoorStop, from Open Door Networks, Inc., is a software-based "firewall" product for Macintosh servers. Unlike conventional firewalls, which are usually expensive dedicated hardware devices, DoorStop is software which you install directly on the servers which you wish to protect. DoorStop is significantly easier to set up and use than a hardware firewall and provides the same capabilities at lower cost. With DoorStop, you can specify precisely which machines should have access to which services, and you can keep track of both allowed and denied access attempts to those services. DoorStop works well with a wide range of Macintosh-based Internet servers, including AppleShare IP, WebSTAR, and Open Door's ShareWay IP product line. Check the Open Door Networks, Inc. site for more information.

MacCoach by Neuron Data Systems is the next generation server monitoring and recovery tool essential to keep your unattended server running 24x7. The MacCoach monitoring function supports all existing and yet to be released applications out of the box, in contrast to previous solutions which required applications to be especially adapted. In addition MacCoach does not spend valuable system resources or CPU cycles to perform its application monitoring. MacCoach is a combination of software and ADB-based hardware and is tightly integrated with the Mac OS. MacCoach thus detects and logs all incidents of when the system stops responding and application errors and optionally performs a restart. The detailed log of events can also be specified to be in HTML format, making the log accessible from any place in the world. Visit the Neuron Data Systems Website for more information.

PowerKey Pro is an essential tool for maintaining unattended Macintosh servers, providing remote control, automation and reliability. Power to a computer and its peripherals can be controlled remotely via telephone; on a timed basis through powerful scheduling; programmatically through AppleScript; and automatically using powerful crash detection and recovery. Apple built direct support for PowerKey Pro right into AppleShare IP 6, allowing PowerKey Pro to detect and respond to server problems even before they cause the system to stop responding.. Visit the Sophisticated Circuits web site for more information on its award-winning server reliability products.

Rebound! is an automatic restart device for Macintosh servers that have stopped responding. A tightly integrated hardware and software solution, Rebound! continuously monitors a server to see if it stops responding, and automatically restarts the computer when necessary by sending the keyboard reset key combination. Apple built direct support for Rebound! right into AppleShare IP 6 allowing Rebound! to detect and respond to server problems even before they cause the system to stop responding. Visit the Sophisticated Circuits web site for more information on its award-winning server reliability products.

The Retrospect Network Backup Kit includes the Retrospect application and ten Mac OS clients making it the ideal backup solution for networked personal computers. All of Retrospect's features extend to your network-unfailing reliability, unattended operation, single step restores from multiple incremental backups, seamless support for nearly every SCSI tape drive and storage device, and something you won't find in any other backup software: Backup Server. Use the unique Backup Server to automatically monitor the network looking for computers in need of backup, even watching for mobile computers when they reconnect to the network. From Dantz Development Corporation.

AppleShare File Server (AFP)

Server Management

AFP Logger is an application which works with your AppleShare IP file server to log accesses to that server. Items logged include the name and address of users logging into the file server, bytes transferred, time connected, and files opened and deleted by those users. AFP Logger also provides a real-time display summarizing overall access to the file server. From Open Door Networks, Inc.

Assimilator is a powerful Macintosh lab management tool designed for situations where you wish to make a large number of Macintoshes look virtually identical. Assimilator periodically restores the content of the local hard disks from a source image on an AppleShare file server. From Stairways Software.

Disk Quota For years, AppleShare administrators have yearned for a system of automatically enforcing limits on the amount of disk space users can have on a server. Now, with Disk Quota, an administrator can easily set up such limits for each user on each AppleShare server, without having to continually monitor disk usage and notify users when they have exceeded their limits. From Santorini consulting & design, inc.

IPNetMonitor provides a set of ten integrated Internet tools which allow Macintosh users to monitor their connection to the Internet. With IPNetMonitor, you can see how the Internet is working, monitor the flow of data to and from your computer, and trace the route by which the data is flowing. This gives the user the information to both optimize internet service and diagnose issues. The tools include Test Connectivity, Trace

Route, Name Server Lookup, Who Is, Finger, Monitor, TCP Info, Connection List, Address Scan, and Subnet Calculator. Check the Sustainable Softworks web site for more information or to download an evaluation copy.

John's Lab Pak is a collection of small applications written by John Ostrowick, to provide a complete mac lab solution. Includes tools for remote manipulation of macs, the addition and removal users, plus a login system. Freeware, Labtools. Some parts still under development.

MacAdministrator works on your network to provide a raft of administration, auditing and control features including logon, protection, printing control and software distribution. From Hi Resolution.

OT Advanced Tuner allows you to optimize TCP/IP network performance under Macintosh Open Transport by tuning internal TCP/IP parameters to match your network environment. The Tuner supports over 30 adjustable parameters including the TCP Window Size, Time Out intervals, Maximum Segment Size, and MTU. Check the Sustainable Softworks web site for more information or to download an evaluation copy.

OTSessionWatcher is a TCP network and application debugging tool. It allows you to examine the data transmitted through Open Transport TCP streams such as those used in AppleShare IP connections as well as those used by web browsers and FTP clients. From Stairways Software.

PageSentry is the "virtual assistant" that constantly watches all of your servers and lets you know if any critical service fails. Use PageSentry to monitor all types of servers, including AppleShare, Web, Mail, FTP and DNS. The key to PageSentry's reliability is that it tests your servers by making actual client requests of the server. Visit the Maxum Development Web site for more information and a free demo copy.

Server Manager is comprehensive management software for AppleShare servers. With Server Manager you can manage your servers remotely, from any Macintosh, anywhere, manage multiple servers simultaneously, share data between them, build related server reports and restrict server access and disconnect idle users. From Santorini consulting & design, inc.

Server Tools is a comprehensive suite of ten utilities that allows you to more effectively and efficiently manage your servers, including AppleShare servers, mail servers, database servers, or any other type of server. With Server Tools, you can detect and avert issues, improve security, manage disk space, and maintain audit trails. Santorini consulting & design, inc.

Server Tracker is the only product that allows you to track changes to your AppleShare servers' folders and files. Server Tracker records which users open, delete, rename or move folders and files, along with the time at which these events occurred. Santorini consulting &design, inc.

TCP/IP Routers

IPNetRouter provides IP multihoming and routing under Macintosh Open Transport. With IPNetRouter, you can use multiple IP interfaces at the same time (such as Ethernet and OT/PPP for example), and specify additional routes for communicating with more than one IP gateway. The built-in IP Masquerading feature allows an entire network to simultaneously share a single Internet connection and end user account. IPNetRouter's OT native design offers superior performance with greatly reduced cost and complexity. Check the Sustainable Softworks web site for more information or to download an evaluation copy.

The VICOM Internet Gateway allows an entire network of users to simultaneously share Internet access via one Internet account, one access device (including modem/ ISDN/ cable-modem/ ADSL/ T1/ existing router) and one phone or ISDN line.

The Internet Gateway is a flexible, fully featured, easy to configure TCP/IP software router that incorporates a DHCP server for easy client set-up, a full PPP server for dial-in access with support for multiple users, and a firewall to protect your LAN from the Internet. CyberNot filter support can prevent access to inappropriate sites, and protocol blocking enables restrictions to be made on the type of Internet traffic allowable. Can be used to interconnect different TCP/IP networks, both local area and wide area--such as head and branch offices--with full support for dial-on-demand and leased line networking, and now supports VICOM Multihosting. Check the Vicom Technology web site for an evaluation copy.

VICOM SoftRouter is a fully featured, easy to set up TCP/IP software router. It routes traffic between ethernet, token ring, MacIP, leased line and dial-up TCP/IP networks, with the added feature of true IP Multi-hosting.

VICOM Multi-hosting allows Web Masters to run multiple Web servers (domain names) on a single Mac OS computer. SoftRouter works with any Web server and is transparent to all web browsers. SoftRouter can be used to interconnect different TCP/IP networks, both local area and wide area, with full support for dial-on-demand networking. A full PPP Server is incorporated supporting dial-in users. Check here for a live example of Multi-hosting. Check the Vicom Technology web site for an evaluation copy of SoftRouter.

Server Extensions

ShareWay IP Gateway brings the benefits of AppleShare IP's file service over TCP/IP to other servers on your network, such as personal file sharing servers. With ShareWay IP, all your servers can now provide Internet and intranet-based file service. From Open Door Networks, Inc.

VICOM DHCP Server is a MacOS-based application that automatically allocates TCP/IP addresses and configuration information to computers on your network. Over 1000 addresses can be distributed to any modern OS computer, including MacOS, Windows95 and NT and Unix. Check the Vicom Technology web site for an evaluation copy.

AFP Clients

AFP Engage! URL Processor works with Web browsers, email readers and most other Internet applications to enable those applications to process AFP (AppleShare) URLs. With the AFP Engage! URL Processor, you can publish URLs to your AppleShare server on Web pages and send them in email messages. Works with URLs over both IP and AppleTalk. From Open Door Networks, Inc.

COPSTalk is a suite of applications and utilities designed to connect Wintel computers to AppleTalk networks. COPSTalk 2.51 is expressly designed for Windows 95 and supports most LocalTalk and Ethernet adapters. COPSTalk for NT is designed for use with Windows NT 4.x and higher. For legacy versions of Windows (Windows 3.1, Windows for Workgroups), COPS offers COPSTalk 1.3. COPS, Inc.

MountIP is an OSAX (AppleScript extension) that adds a new command to the AppleScript language, enabling users to write scripts that can mount AppleShare IP-based servers. It supports both anonymous as well as authenticated logins via the standard AFP URL syntax. MountIP is FREEWARE, so use it and enjoy.

PC MACLAN Pro for Windows 95 is the only software suite to combine IP (Internet Protocol), LAN and remote access technology into one package for file and printer sharing between PCs and Macs. This powerful networking suite is the ideal cross-platform integration tool for applications in pre-press, content development, education and other Apple-dominated markets. Miramar's IP (Internet Protocol) Client technology lets users expand their networking capabilities by accessing any AppleShare IP 5.0 Server, whether located locally, at a branch office on the company WAN, or across the globe over the internet. From Miramar Systems.

Unmounter is a shareware application that automatically unmounts unused shared disks and allows the user to remount them easily from the desktop. Unmounter is especially useful in remote access and dial-on-demand environments, where phone and ISDN lines stay open while AFP sessions are active. From DouWere.

VICOM SurfDoubler allows two computers to share Internet access via one connection device (including modem/cable modem/ISDN/ADSL) and one ISP account at the same time. An Automatic Set-up Wizard makes configuration simple for even the non-technical! More information and a free evaluation copy can be found at the Vicom Technology web site. From Vicom Technology Ltd.

Web Engage! enables the Web and FTP components of your AppleShare IP server to be easily found and accessed using the Chooser. The Web Engage! plug-in registers these services on AppleTalk, and the Web Engage! and FTP Engage! Chooser extensions let you browse for these services by zone and initiate access to the services through the Chooser--just the way you'd expect on a Macintosh! From Open Door Networks, Inc.

Web Server

Document Management

WebSonar is a complete drag, drop, search and deliver, document management system optimized for AppleShare IP. WebSonar allows users to dynamically publish information quickly and easily on either the Internet or an intranet by simply dropping their existing files into a folder. WebSonar can archive then search very large databases, standard legacy documents, PDF and html documents all at the same time. Based on Virginia Systems' Sonar Professional search engine, WebSonar can search over 12,000 pages per second, displaying the full content and exact page numbers of all found documents. Searching can be performed by any computer running a web browser. Files are dynamically translated to html and a download link can be displayed on every page to allow the client to retrieve the original file. Try it out on the WisdomQuest eLibrary, served on a G3 with AppleShare IP, now containing over 123,000 searchable documents with more being added every day.

Site Mangement

ClickLog makes it easy to log people who click on Ad banners. When someone clicks on the ad, their IP address, date/time, and what they click on is logged to a file. They are then redirected to the location in the search arguments. It allows the tracking of people who click on links that are not on your website. From Clear Ink.

InfoAgency CGI provides a means of monitoring computers on your network. You may, for example, wish to see what applications are being run on each computer, idle time, Kerboros user, installed RAM, printer selected etc etc. The Info Agency software will allow you to do this. From Hi Resolution.

LogDoor Multi-domain Web Site Monitor provides real-time statistics on each site on your server, plus site-by-site summaries and logfiles. LogDoor also displays information about AppleShare IP plug-ins. From Open Door Networks, Inc.

LOG FM is a full-featured web-server log-analysis and real-time statistics application for WebSTAR API 1.2 compatible web servers that is powered by the runtime database engine of FileMaker Pro. Web Broadcasting

TombStone is a collection of 3 plug-ins, which prevent proxies and client caches from caching your data. There is one plugin each for HTML files, GIF files and JPEG files. This plug-in is really useful for images used in the LOWSRC attribute. From Clear Ink.

Virtual Hosting

ClearlyHome is a WebServe plugin that allows Macintosh WebMasters to point multiple domain names at a single Macintosh WebStar server. From Clear Ink.

HomeDoor Multi-domain Web Service Manager was the first multi-domain Web service manager on the Macintosh. With HomeDoor your AppleShare IP Web server can serve pages for multiple independent domains. From Open Door Networks, Inc.

Pardeikes Welcome Plugin combines three basic functions: Virtual Hosting of an unlimited number of domains or sites, Dynamic URL Manipulation and Realtime Graphical Statistics. For more information visit Pardeikes.

Searching and Indexing

FindFile is a WebSTAR plugin that allows you to search your entire Macintosh web server for all files that contain a given keyword in their name. FindFile will search all volumes on the web server's desktop, including remotely mounted file servers. For each file that is found, FindFile will list its full name, location, creation and modification dates, and a link that you can click on to download (via FTP) the file to your desktop. FindFile is freeware from Xperts, Inc.

Phantom is the Web crawler and search engine that makes your Web site accessible. Phantom is the easiest way to add searching capability to your site, but Phantom does much more. Since it can crawl sites via the Web as well as local files, it can index a group of sites on a related topic. Phantom is also ideal for creating a central index for all of your organization's intranet servers. Visit the Maxum Development Web site for more information and a free demo copy.

Image Maps

FastMap is a plug-in for handling server side NCSA style image maps quickly and efficiently. From Clear Ink

Publishing and Web Site Creation

ChoosePage is a plug-in that allows you to put a pop-up dialog on a web page. When someone clicks the submit button, they are redirected to the location specified in the pop-up. An example of this technology in use is at the bottom of the pages on the ClearInk website. From Clear Ink

DynaMorph is a cross platform server side scripting engine and integrated database that enables web site developers to easily construct and maintain large or dynamic web sites. DynaMorph supports the following platforms and web servers: Macintosh, UNIX, and Windows NT/96. DynaMorph's intelligent document caching system provides peak performance and keeps your site up-to-date as you make changes. From Morph Technologies, Inc.

NetCloak, the 1996 winner of MacUser Magazine's "Eddy" award for "Best New Internet Server Application," gives you dozens of HTML extension commands that make it easy to build dynamic, compelling Web pages. Add dynamic information like date and time to your pages, as well as headers, footers, counters, and more. All with no programming required! Visit the Maxum Development Web site for more information and a free demo copy. From Maxum Development Corporation

NetForms makes it easy to create interactive Web sites. NetForms makes your users an active part of your Web site, but keeps you in complete control. With NetForms on your Web server, you can turn data from HTML forms into text files, e-mail messages, even new Web pages. Create mailing list maintenance pages, guestbooks, surveys and online discussion forums with no programming required! Visit the Maxum Development Web site for more information and a free demo copy. control. From Maxum Development Corporation

PICT FM is the first web server picture add-on product for Claris Corporation's FileMakerÂ® Pro 3.0v4 for Macintosh. PICT FM enables on-the-fly PICT to JPEG conversion of graphic images stored or referenced in FileMaker Pro container fields. From Web Broadcasting

SiteCam adds a full-featured webcam to your Macintosh! Stream live video and/or automatically captures JPEG, PICT, GIF images and QuickTime movies. Visit Rearden Technology to see it in action and purchase it on-line. From Rearden Technology

SMTPMaillT is an AppleScriptable, lean, mean, multi-threaded, asynchronous, fat, Open Transport aware SMTP Mail sending application. It's a great solution for Web servers, monitoring applications, debugging, 'back-ending' and more. From Hi Resolution.

WEB FM enables FileMaker Pro developers to quickly and easily build wicked fast, truly dynamic and interactive online database applications for the World Wide Web or a corporate Intranet. The feature list mirrors that of FileMaker Pro with support for relational and portal fields; browsing, sorting, creating and editing database records; even running ScriptMaker scripts. From Web Broadcasting

Java

JRun Servlet Engine is an extension to AppleShare IP that allows you to run Java Servlets (server-side Java). JRun works in conjunction with the web server to allow you to run sophisticated server-side Java applications. Java servlets are an attractive alternative to CGI (Common Gateway Interface) or Perl scripts because servlets are platform independent, easier to develop, faster to deploy, and more cost-effective to maintain. JRun is available for free to end users. Visit the Live Software web site to download the JRun Servlet Engine.

ServletExec for Mac OS is a W*API-compatible plug-in that runs Java servlets. Servlets are alternatives to traditional CGIs and web server plug-ins for extending web server functionality. Written in Java to a standard API, servlets can run with any leading web server (Microsoft IIS, Netscape FastTrack and Enterprise, Apache, JavaSoft JavaWebServer) on any computing platform (Mac OS, Windows 95/NT, Unix). ServletExec for Mac OS takes advantage of the Mac OS Runtime for Java (MRJ). New Atlanta Communications, LLC

Mail Server

ClickMail Central Directory provides a master list of users' email addresses integrated with AppleShare Users and Groups. Users can find addresses and build personal address books in their mail client (Netscape, Eudora, QuickMail Pro, Microsoft Outlook, etc.) via LDAP (Lightweight Directory Access Protocol). ClickMail can also serve private/public contact information of any kind (phone, address, public key, etc.) via LDAP. Allows remote changes, imports, exports of AppleShare users.

PowerBook: I Forgot My Password for Password Security

What do I do if I forget my password for the Password Security control panel? Is there a way to access my hard disk?

This article has been archived and is no longer updated by Apple.

The Password Security control panel is software designed to protect the data on the PowerBook computer's hard disk. If you forget your password, you cannot access the system because the password is written to your hard disk at the driver level.

The recommended option is to carry your PowerBook, with a proof of purchase (receipt), to an Apple Authorized Service Provider (AASP). Using approved Apple procedures, a technician can access the hard disk without data loss and reset the password control panel.

If you must access the hard disk without your password, it can be done at the cost of losing all the data on your hard disk. The procedure is listed below.

Warning: **Following this procedure will erase all data on the hard disk.**

Procedure

- Startup from the system CD or Disk Tools disk that came with your PowerBook.
- Click Cancel when the Password Security window appears. This should let the PowerBook start without the hard disk mounting to the desktop.
- Open Drive Setup, select the hard disk, and choose to initialize it.

Published Date: Feb 20, 2012

Printer Troubleshooting: Printer Does Not Appear In Chooser

What do I do when my printer does not appear in the Chooser?
This article has been archived and is no longer updated by Apple.

Does The Printer Appear In The Chooser Icon List?

Icons representing Chooser extensions appear in the Chooser icon list (see figure 1). Chooser extensions include those enabling the use of software and devices such as printers, AppleShare, fax modem software, some scanners, and so on.

Figure 1: The parts of the Chooser window. Not all networks are configured to have zones.

When an icon does not appear in the Chooser icon list, the extension it represents is:

- not installed (missing).
- located somewhere outside the Extensions folder of the System Folder.
- damaged.

Confirm that the extension is present in the Extensions folder of the System Folder, or turned on in the Extensions Manager control panel (System 7.5 and later). When searching, remember that its name may only be an abbreviated form of the printer's name. If you have recently performed a clean installation of the operating system, look for it in the previous System Folder. The extension will function only if it is in the Extensions folder of the active System Folder. If the correct name is not known, consult the printer documentation. If the extension cannot be found, reinstall the printer software.

If the extension is present but the filename is followed by any of these suffixes, the printer software is not properly installed: .sea, .sit, .hqx, .smi, .img, .cpt, .bin. These represent files still compressed or encoded for Internet delivery. Remove them from the Extensions folder and consult the printer documentation for instructions on how to decompress/decode these files and perform a proper installation.

Finally, if the extension is located correctly and appears intact (attempting to open it should produce a system alert to the effect that it is an extension belonging in the Extensions folder), it may nevertheless be damaged. Remove and reinstall it from the original source.

Does The Printer Name Appear In The Chooser Device List?

Only networked and USB printers will show a printer name in the device list (see figures 1 and 3) and, importantly, **only after being selected in the icon list**.

The device list for non-networked and non-USB printers shows only the port names: printer port and modem port, or printer/modem port (see figure 2). However, when the serial printer is being adapted for network use with a hardware adapter, such as the LocalTalk and Ethernet adapters available for some Apple StyleWriter printers, the printer name will typically appear beneath the port names.

Figure 2: The Chooser configured for a serial printer.

Networked Printers

- If the network has zones, and the printer is in a different zone than the computer, be sure to select the printer's zone from the zone list before checking the device list.
- If other networked printers and volumes are also absent from the device list, confirm that the Network control panel or AppleTalk control panel is configured correctly for the type of network in use, and be sure AppleTalk is set to "Active" in the Chooser. Otherwise, troubleshoot the network hardware and connections and if possible verify the printer itself by looking for it in the Chooser of other networked computers.
- If the printer is configured for TCP/IP printing instead of AppleTalk, it cannot be set up through the Chooser. The details of configuring for TCP/IP printing are beyond the scope of this article. Consult your network administrator.

USB Printers

- Troubleshoot as you would any other USB device: Check the USB cable connections at both ends and test with a direct connection to one of the computer's primary USB ports, bypassing all other USB devices. Swap the USB cable with another known-good cable if possible, or verify it with another USB device. Use the Apple System Profiler to confirm that the device is logically present to the computer.
- A variety of USB printers on the market ship with separate printer software installers supporting either serial or USB connections. Be sure you are using the software appropriate for USB. Not all USB printer drivers will show the printer name in the device list as shown in Figure 3. Others may show a generic designation, like "USB."
- Check for any alert lights on the printer. These may indicate an issue which is preventing the printer from showing in the Chooser. Refer to you printer's manual or online documentation for the meaning of any alert lights.

Figure 3: The Chooser configured for a USB printer.

Serial Printers

Assuming the computer in use has serial ports, it is rare for the port names to be absent from the device list after having selected a serial printer icon. Remove and reinstall the printer software if this occurs, and perform other basic software troubleshooting as necessary.

Macintosh: How to Test FireWire Ports

This article explains how to test the FireWire ports on a Macintosh computer.
This article has been archived and is no longer updated by Apple.
Before testing the FireWire ports, make sure FireWire software is installed. The FireWire software is installed by default on any computer with built-in FireWire ports. It is also available from Apple's Web site at http://www.apple.com/swupdates/ .

FireWire PCI Card (for original Power Macintosh G3 computer)

The disc included with the FireWire PCI card installs an application named FireWire Card Tester in the FireWire folder of your hard disk.

When opened, the application displays one of the three alert boxes shown below, detailing the status of the card's FireWire ports. See Figures 1 through 3.

Figure 1 FireWire alert; no response

The message in Figure 1 indicates that the computer cannot detect the card. Try removing the card from its PCI slot, and firmly reinserting it. Make sure the card's internal power connector is connected to one of the hard drive power connectors, which originates from the power supply.

Figure 2 FireWire alert; no camera

If you see the alert box shown in Figure 2, make sure the camera is turned on, and is not in sleep mode. Try opening the application again. If you continue to see this alert box, check cabling, and try a different camera.

Figure 3 FireWire alert; functioning properly

The message shown in Figure 3 indicates that the card is functioning as it should.

Power Macintosh G3 (Blue and White) with Mac OS 8.5 or 8.5.1

The FireWire Card Tester application is not compatible with the FireWire ports on the Power Macintosh G3 (Blue and White) computer. Use the Apple Video Player application installed in the Applications folder on the hard disk to test the ports instead.

Note: Apple Video Player is not designed to capture digital video (also referred to as DV) and Apple does not support using it for that purpose. However, it can be used to test the ports. Also, note that this method of testing the FireWire ports is not reliable if another video capture device is installed on the computer.

Figure 4 Apple Video Player; camera sensed

Confirm the camera is connected to the FireWire port and turned on prior to opening Apple Video Player. If Apple Video Player senses the camera, the Apple Video Player Controls window will look like the one shown in Figure 4, which indicates that the ports and the computer are functioning properly.

Figure 5 Apple Video Player; camera not sensed

If Apple Video Player does not sense the camera, only one option will appear in the Apple Video Player Controls window. See Figure 5. Double-check the connection from the camera to the computer, and make sure that the camera is on and not in sleep mode.

If this fails, perform a clean installation of the system software, and update to the version of FireWire software available from Apple's Web site at http://www.apple.com/swupdates/ .

Macintosh computer with built-in FireWire ports and Mac OS 8.6 or later

The version of Apple System Profiler that came with Mac OS 8.6, and subsequent versions, have the ability to check the built-in FireWire ports

and report the version of the FireWire software installed.

Apple System Profiler steps

1. Choose Apple System Profiler from the Apple menu.
2. Click the Devices and Volumes tab. The information for FireWire appears. See Figure 6.

Figure 6 FireWire information in Apple System Profiler.

The camera must be turned on prior to opening Apple System Profiler or it will not be detected. Figure 7 is similar to what you should see if a camera is detected.

Figure 7 Camera detected by Apple System Profiler

Sherlock: "A Network Error Has Occurred" Message

This article describes the Sherlock error message, "A network error has occurred, check your connections and try again."
This article has been archived and is no longer updated by Apple.
Here are some common reasons why this occurs:

- An unusable or outdated Sherlock plug-in. To locate the troublesome plug-in, disable all of your Sherlock plugins. Next, enable one at a time, attempting to search Sherlock with each new addition until the issue reappears. Once you have isolated the problematic plug-in, either replace the plug-in with a fresh copy, or try using the "update search sites" feature of Sherlock.

  Note: Sherlock2 automatically updates the search site plug-ins so you cannot manually update them.
- No network connection. If you are using a dial up connection to the Internet, you must be connected.
- Incompatible version of Internet Config software. For more information, see the following Knowledge Base article 24736: "**Sherlock: Internet Config Conflict**"

Published Date: Feb 20, 2012

AppleShare IP: Multihoming And FileMaker Pro Web Companion

Using the single-link multihoming (multinode) capability provided by Open Transport, I am hosting several websites (each with unique IP addresses) from my AppleShare IP 6.1 server. Most of these sites are served through AppleShare IP's Web Services, but one site is served with Filemaker Pro 4.1 Web Companion. I have set up MacDNS to include zone files for each site, and I have entered my IP addresses in the Secondary IP Addresses file in my System Folder. However, it appears as if the two services are fighting with each other: if Filemaker starts first, Web and File Services will not start, and if Web and File Services starts first, my Filemaker site cannot be accessed. How can I get these two applications to co-exist peacefully?

This article has been archived and is no longer updated by Apple.

When setting up AppleShare IP Web Services in conjunction with a Filemaker Pro Web Companion database, administrators may run into a situation in which the two services prevent each other from operating as expected. The solution is to assign FileMaker Web Companion a different port than that which is typically reserved for http services.

Both Filemaker Pro Web Companion and AppleShare IP Web Services use TCP/IP port 80 by default. Therefore, you must assign a new port to Filemaker Pro. Although any unused port will suffice, your first choice should be port 591, as Filemaker, Inc. has registered this port with the Internet Assigned Numbers Authority for use with Web Companion. See Figure 1.

Figure 1: FileMaker Pro Web Companion Configuration window.

After you have changed this port, the IP address by which the site can be accessed will now be followed by a colon and the port number. For example:

```
your.website.com:591
```

In order to save visitors to your site the inconvenience of having to type in the port number, you should then create an HTML document at the top of the website folder served by Filemaker Web Companion with a hyperlink to your database.

Published Date: Feb 20, 2012

Epson Printers: Installer Says Disk Is Locked

When trying to install various Epson printer drivers from a Power Macintosh G3 (Blue & White) System Software CD, the installer fails. This article provides the steps to install the software from the System Software CD.
This article has been archived and is no longer updated by Apple.

Symptom

When the System Software CD is the startup disk and you try to install Epson printer drivers from the Power Macintosh G3 (Blue & White) System Software CD, the installer fails with an error message that the selected disk is locked.

Affected Products

- Power Macintosh G3 (Blue & White)
- Epson Stylus Color 440 Printer driver
- Epson Stylus Color 600 Printer driver
- Epson Stylus Color 640 Printer driver
- Epson Stylus Color 740 Printer driver
- Epson Stylus Photo Ex Printer driver

Solution

To successfully install these drivers, follow these steps:

1. Open the Startup Disk control panel (under the Apple menu), and choose your hard drive as the startup disk.

2. Restart the computer holding down the Shift key until you see the screen saying "Welcome to Mac OS Extensions Disabled" (the Power Macintosh G3 CD should still be in the drive).

3. Once the desktop appears, open the CD Extras folder, the USB Device Drivers folder, and then the Epson Printers folder. Open the folder whose name corresponds to your Epson printer. Select the disk image(s) within, and open them, mounting the disk image(s).

4. Launch the installer for your printer, and verify that the destination disk is your hard drive.

5. Once the installation is successfully completed, restart the computer. The Power Macintosh G3 CD can now be removed.

The Epson drivers on the CD were the most recent versions available when the CD was created. Check with the product vendor for the latest updates. If installation problems persist, please review the support information included with your printer and contact Epson technical support for further assistance.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following article can help you search for a particular vendor's address and phone number:

Mac OS Runtime for Java: Inconsistent Results Running Applets

Why does my Java applet work with Netscape Navigator but not Microsoft Internet Explorer, and sometimes the reverse occurs?

Why does my Java applet work with Netscape Navigator but not the Apple Applet Runner, and sometimes the reverse occurs?
This article has been archived and is no longer updated by Apple.
The answer to these questions has to do with which Java Virtual Machine (JVM) is being used. Your applet is probably running in two different virtual machines.

The Apple Applet runner always uses the Mac OS Runtime for Java (MRJ) JVM.

Netscape uses its own JVM for both Navigator and Communicator (at least, through version 4.5).

Microsoft Internet Explorer has had the option to use either a Microsoft JVM or the MRJ JVM, but since Mac OS 8.5, it is installed and configured to use the MRJ JVM by default.

One other possibility that could result in differences when running an applet is that you may not have configured the JVM in question properly, especially for proxy servers and firewalls. For further information, see the following Tech Info Library article:

Article 60051: "**Mac OS Runtime for Java 2.1: Configuring For Proxy Servers**"
Published Date: Feb 20, 2012

PowerBook G3 Series: "Apple DVD Player Cannot Open..." Error

This article explains what to do when a DVD movie will not play on a PowerBook G3 Series computer and the error message "Apple DVD Player cannot open because the required hardware was not found." is generated.
This article has been archived and is no longer updated by Apple.

Symptom:

When trying to play a DVD movie on a PowerBook G3 Series computer, the following error message appears:

Figure 1: DVD Error Message

Affected Products:

PowerBook G3 Series computer

Solution:

There are several things that can cause this particular hardware error message to appear.

DVD PC Card Not Being Inserted Properly

Only the bottom PCMCIA slot supports Zoomed Video, which is needed to play DVD movies. Eject the DVD PC Card, wait 8-10 seconds, and then reinsert it back into the bottom PCMCIA slot.

DVD PC Card Is Not A Custom Icon, But A Generic One

Reinstall the DVD Software. You may want to check Apple Software Updates to make sure you have the latest version.

Speech Recognition Is Installed

If it is installed and listening is turned on, Speech Recognition will take control of the Sound Monitoring Source option within the Monitors & Sound control panel and set it to the Built-In Mic. To properly play the DVD movie, either disable Speech Recognition or change the Sound Monitoring Source back to the ZoomedVideo.

Notes:

1. Before having the computer serviced, you should completely eliminate software as a possible cause of the issue. First, set the Extensions Manager to the OS extensions plus those needed for the DVD Software, reset Parameter RAM, restart the computer, and then test the system to see if the error still occurs. To do this, perform the following steps:

- Open the Extensions Manager

- Select 'PBG3 Series All' or 'Mac OS 8.5 All' as the Selected Set

- Duplicate the locked set, naming it "test" or similar name. The Locked Extension set cannot be modified.

- Choose 'as Packages' from under View on the MenuBar

- Check the box next to 'Apple DVD Software'.

If necessary, run Disk First Aid on your hard drive. Finally, perform a clean install of Mac OS and reinstall the DVD Software only, then retest.

2. For information on performing a Clean Installation of system software, see the following articles:

- Article 26055: "**Mac OS 8.0 & 8.1: Clean Install Instructions**"

- Article 50055: "**Miscellaneous Manuals**". Select Troubleshooting Handbook - Performing a Clean Installation.

- Article 58176: "**Mac OS 8.5: Performing a Clean Install**"

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: PowerBook G3, G3 Series: Identifying Different Versions

Mac OS: What is a Game Sprocket?

I see several files in my System Folder with the word "Sprocket" in the title. The Info window shows that these are copyright Apple Computer. What are they and what are they for?

This document applies to Mac OS 9 and earlier.
This article has been archived and is no longer updated by Apple.
Apple Game Sprockets is a set of technologies designed to make writing Macintosh games easier for developers. They are designed specifically to provide the functionality that games need on the Macintosh: drawing to the screen, handling input devices, setting up multiplayer games, and simulating 3D sound sources.

There are four kinds of game sprockets: InputSprocket, DrawSprocket, NetSprocket and SoundSprocket.

InputSprocket allows games to support a wide variety of input devices including joysticks, gamepads, steering wheels and flight sticks without having to write customized routines for each.

DrawSprocket gives game developers a way of using different graphics hardware (video cards/chips) without having to write customized routines for that hardware. DrawSprocket allows the user to select among any connected monitor that meets the requirements of the game.

NetSprocket gives game developers standard ways to configure networking preferences and to send and receive information to other players.

SoundSprocket gives game developers an easier way to use sound including simulating 3D sound. SoundSprocket will display a dialog for configuring the sound options supported by the game.

AppleShare IP 6.1: "Bad file format" Opening Files In QuarkXPress/Win

When saving a QuarkXPress 4.04 for Windows file to an AppleShare IP (ASIP) 6.1 server using Windows File Sharing, the file saves properly. When the file is reopened, it displays the error message ""Bad file format (70)".
This article has been archived and is no longer updated by Apple.

Problem

When saving a QuarkXPress 4.04 for Windows file to an AppleShare IP (ASIP) 6.1 server using Windows File Sharing, the file saves properly. When the file is reopened, it displays the error message ""Bad file format (70)".

Products Affected

AppleShare IP (ASIP) 6.1 server

Solution

This issue has been corrected in AppleShare IP 6.2. You need to upgrade to AppleShare IP 6.2 to resolve this issue.

Mac OS: Modem Unexpectedly Dials

The modem may unexpectedly dial out, automatically attempting to connect to the Internet. Several things may cause this behavior.
This article has been archived and is no longer updated by Apple.

Symptom

The modem unexpectedly dials out. This may occur at startup, after disconnecting from an Internet service provider, or at other unexpected times.

Solution

An application or control panel setting can trigger an automatic connection to the Internet.

To prevent unexpected behavior, check the following items to be sure they are set up as you desire. Any of these items could cause automatic connection to the Internet:

- An Internet application or its alias is in the Startup Items folder.

  How to address: Remove undesired items from the Startup Items folder in the System Folder.

- The TCP/IP control panel is set to always load.

  How to address: Open the TCP/IP control panel. Choose User Mode from the Edit menu and make sure Advanced is selected. Click Options. The Options window appears. Be sure the "Load only when needed" checkbox is selected.
- Web Sharing is active.

  How to address: Open the Web Sharing control panel. If you use Web Sharing over a dial-up connection, be sure to click the Stop button when you are finished.

- File Sharing over TCP/IP is enabled.

  How to address: Open the File Sharing control panel. Look for the setting "Enable File Sharing clients to connect over TCP/IP." Deselect the checkbox for this feature after you finish File Sharing. If you never accept File Sharing connections over your dial-up connection, always leave this unchecked.

- Email application connects to the Internet.

  How to address: Go to the preferences panel in your email application. Look for an option such as "automatically check mail," and disable it.
- The Date & Time control panel is set to "Use a Network Time Server".

  How to address: To prevent undesired connections, be sure the checkbox for this feature is deselected in the Date & Time control panel.
  Note: You can still synchronize manually when you are already connected to the Internet: Open the Date & Time control panel. Click the checkbox to select "Use a Network Time Server". Click the Server Options button. Click the Manually radio button. Click the Set Time Now button. Click OK. Click the checkbox for "Use a Network Time Server" again to leave the feature disabled.

- The Software Update control panel is set to "Update software automatically".

  How to address: Open the Software Update control panel. Deselect the checkbox for "Update software automatically".
  Note: Alternatively, you can check for updates at a more convenient time by clicking the Schedule button. Set a new time by clicking on the hour, minute and AM/PM indicator and then adjusting with the up/down arrows. Check the day or days you prefer.

- The Remote Access control panel is set to connect automatically.

  How to address: To check this, open the Remote Access control panel and click Options. The Options window appears. Click the Protocol tab, then select the PPP protocol. Deselect the checkbox for "Connect automatically when starting TCP/IP applications". Close the Remote Access control panel.
  Note: After deselecting this option, you must click "Connect" in the Remote Access control panel or the Remote Access portion of the Control Strip prior to opening your Internet applications.

AppleShare IP: Setting Up Guest Access To Web Folder

How do I set up my AppleShare IP Web Folder so that my website is accessible to everyone?
This article has been archived and is no longer updated by Apple.
In order for guests to access your website without a user name and password, you must specify the proper web folder and set the privileges to the folder correctly. This includes any folders that are nested inside the web folder.

1. Open the AppleShare IP Web & File Admin program, choose Web & File Server Settings from the Server menu, click on General and select Web. Make sure that the web services are enabled and that the correct web folder is listed and that the correct default document is selected.
2. Choose Show Users & Groups List from the Users menu and select the guest user from the list. Open the user by double-clicking the user's name or selecting the Open User button which is the middle button at the top of the Users & Groups window; make sure that the checkbox for web access has a checkmark.
3. Choose "Show Disks & Share Points" from the Server menu. Select your web folder in the Disks & Share Points window and click the privileges button (upper left hand corner of window) to show the privileges window.
4. On AppleShare IP 5.x servers, you must select "Make this a share point and set privileges". On AppleShare IP 6.x servers, the Web Folder does not have to be a separate sharepoint, so you may simply select "Set privileges for this item."
5. Set Read-only privileges (the eyeglasses icon) for "Everyone", then click the Save button.
6. Click the "Make all enclosed folders like this one" button and close the window.

Test your web services; your web page should now be accessible to everyone.

Macintosh: Using Command-Option-Shift-Delete To Start Up From CD

This article describes the proper key sequence to startup from a CD-ROM disc, which is incorrectly described in some Mac OS 8.5 Troubleshooting Handbooks.
This article has been archived and is no longer updated by Apple.
On page 25 of the Mac OS 8.5 Troubleshooting Handbook that ships with the iMac and Power Macintosh G3 (Blue and White), a procedure is listed for starting up the computer from a CD by holding down the Command, Option, Shift, and Delete keys.

This procedure is intended for certain older Macintosh computers, and does not apply to the iMac and Power Macintosh G3 (Blue and White). For these, and later, Macintosh computers, the recommended method of starting up from the CD is to hold down the C key during startup.

Older Macintosh computers that did not support the C key as a method of starting up from the CD can use the Command-Option-Shift-Delete key sequence.

Published Date: Feb 20, 2012

Network Connection Troubleshooting

This article describes known iMac, PowerBook G3 Series (Bronze Keyboard), and Power Macintosh G3 (Blue and White) networking issues and provides workarounds to these issues.
This article has been archived and is no longer updated by Apple.

Connecting To A 10/100Base-T Network

When you connect your computer to an Ethernet network, the computer automatically senses whether it is connected to a 10Base-T network or to a 100Base-T network. Some (possibly all) ports on some network hubs/switches support both speeds. If you are using this type of hub/switch, there may be a delay in establishing a network link. The delay may last for several seconds after you start or restart the computer and a message may appear stating the network is not available or just become available. In order to prevent delays, connect your computer to an Ethernet network port that is not auto-sensing (10 or 100 megabits per second (Mbps) only). For more information, contact the manufacturer of the Ethernet hub/switch or your network administrator.

Performance Issues Using Ethernet

If your computer experiences performance issues on your Ethernet network, check with your network administrator. Your computer performs best when the Ethernet port is set to auto-negotiation.

Important: The duplex mode of an Ethernet link to a switch is not detected if the switch's port is not auto-negotiating. If the switch's port is not auto-negotiating, your computer detects the appropriate speed but defaults to half-duplex. If the switch's port at the other end of the link is configured for full-duplex, a large number of late events can occur on the link. Set the switch's port to auto-negotiation where possible. If this is not possible, then set the switch's port to half-duplex. For more information, see the documentation that came with the Ethernet switch.

NetBoot Issues

If your iMac, PowerBook G3 Series (Bronze keyboard), or Power Macintosh G3 (Blue and White) is having difficulty starting up from a NetBoot server, check that the Ethernet switch port it is connected to is set to auto-negotiation or locked to half-duplex.

Because of the way NetBoot works, your computer will not startup from a NetBoot server if the switch's port is locked to full-duplex. If your computer is still having trouble starting up from a NetBoot boot server on a regular basis, try plugging your computer into a Ethernet hub , then plug the hub into the switch.

Starting up from a NetBoot server may also fail on some switches due to how NetBoot and Ethernet switches function. As a workaround, placing a 10/100 Mbit repeater (hub) between the computer and switch.

Sherlock: Can‘t Find ICAp;InternetConfigLib

I just installed some software and now when I try to access Sherlock, I get the following message:

The application "Sherlock" could not be opened because "ICAp;InternetConfigLib" could not be found.

What happened and how can I correct it?
This article has been archived and is no longer updated by Apple.

Figure 1: Error dialog.

The software you installed probably also installed an older version of Internet Config. The following article has information on how to use the Mac OS 8.5 Installer to perform a custom-install, which should remedy the situation.

Article 24679: "**Mac OS 8.5: Internet Control Panel Or Internet Config?**"

Published Date: Feb 20, 2012

Mac OS X Server: Binding Local NetInfo Database To An NIS Domain

Network Information System (NIS) is similar to NetIfno in that it allows multiple computers to share administrative data that is stored on one computer. It is different because NIS uses the standard UNIX flat files for this administrative data, while NetInfo uses a distributed database. Configuring Mac OS X Server to be an NIS client should not affect NetInfo.
This article has been archived and is no longer updated by Apple.
Note: Configuration of Mac OS X Server as an NIS client is not supported by Apple. This document is provided as is with no warranty. Screen shots in this document depict Mac OS X Server versions 1.x, though this information also applies to versions 10.x of Mac OS X Server. The loginwindow process in Mac OS X 10.2 or later only supports Directory Services, so 10.2 clients bound to an NIS master will not be able to log in at the Login Window.

This article assumes knowledge of NetInfo and its structure. For more information on NetInfo, please read the following article:

Article 60038: "**Mac OS X Server: What Is NetInfo?**"

Article 60038 also contains instructions on backing up the database which should be done before continuing.

For Mac OS X Server to bind to an NIS domain, the /etc/hostconfig file must be changed and lookupd must be configured to use NIS. The user must be logged in as root, or be a member of the wheel group in order to make these changes.

Edit the hostconfig file

Open the /etc/hostconfig file with TextEdit or a command line text editor. Find the "NISDOMAIN" entry. This is set to "-NO-" by default. Remove "-NO-" and type in the NIS domain name that the computer will bind to. This information can be obtained from the NIS administrator.

Configure lookupd

To properly configure lookupd to use NIS directories, properties, and values must be added to NetInfo. For a description of how these are used in NetInfo read article 60038, mentioned above.

Open /System/Administration/NetInfoManager. The window that opens will be for the local NetInfo domain. (See Figure 1.) In this window find the "Directory Browser" heading in the top left corner of the window. Below this heading are three columns, that show the directories contained in NetInfo. In the middle column select the "locations" directory and click the new directory button. A "new_directory" is created.

In the lower half of the NetInfo window two columns are listed, "Property" and "Value(s)". Change "new_directory" in the value column by double clicking on it and typing lookupd. The window should now look like Figure 1.

Figure 1: NetInfo window.

You will not be prompted to save the changes until another directory in NetInfo is selected. Save the changes when prompted. After the changes are saved, another dialog box will appear asking for confirmation of the update. Click "Update this copy" for the changes to be finalized.

Now the correct properties and values must be added to the lookupd directory. In the lower half of the window click "lookupd" under the Property column; the entire line is now selected. Open the "Directory" menu from the menubar. It is now possible to edit properties and values. Until this line was selected the options in this menu were dimmed.

Use Figure 2 as a guide to add the properties and values to the lookupd subdirectory.

Figure 2: NetInfo window with properties and values filled in.

Now the lookupd directory has the properties and values that it needs. To finish the configuration, subdirectories for "users", "groups", "hosts", and "netgroups" must be added to the lookupd directory. These directories also need properties and values. If any of these subdirectories are not added NIS will not be consulted for this information. Use Figures 3, 4, 5, and 6 as a guide for adding the new subdirectories, properties, and values. The computer must be restarted for the changes to take effect.

Figure 3: NetInfo window; users directory.

Figure 4: NetInfo window; groups directory.

Figure 5: NetInfo window; hosts directory.

Power Macintosh G3 (Blue and White): Using SCSI Cards with Color OneScanner

This article describes a situation where the scanner appears when using SCSI probe to scan the bus, but there is an X through the extension at startup.

This article has been archived and is no longer updated by Apple.

Symptom

Scanner extension has an X through it upon startup and the scanner itself cannot be used.

Solution

To use the scanner with an Adaptec SCSI card (and possibly others) you must do two things:

- Place the most recent version of the SCSI Probe control panel (available from Adaptec's website) in your Control Panels folder, open it, select Preferences, and choose to "Mount SCSI volumes during startup."
- Place version 4.3 of the scanner extension in your System Folder (not in the Extensions folder or any other folder within your System Folder).

When you restart your computer, the scanner extension will load last and will not have an X through it, assuming the scanner is powered on and properly connected. If the extension still loads with an X through it, contact Adaptec to verify the ROM's on the SCSI card are version 4.3 compliant.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information. The following article can help you search for a particular vendor's address and phone number: Article 17159: "**Locating Vendor Information**"

Power Macintosh G3 (Blue and White): PowerBook SCSI Disk Mode

I would like to use a PowerBook in SCSI Disk Mode with my new Power Macintosh G3 (Blue and White). How do I connect the PowerBook to the computer?

This article has been archived and is no longer updated by Apple.

To use a PowerBook in SCSI Disk mode with a Power Macintosh G3 (Blue and White), the Power Macintosh G3 (Blue and White) must be configured with one of Apple's SCSI card options. The recommended solution is to use the Apple Ultra PCI SCSI card which is available as a Build To Order option from the Apple Store. This card ships with an HD50 to 25 pin adapter for use with a standard SCSI system cable. Make sure the PowerBook has password security disabled before using the PowerBook in SCSI Disk mode. Also, you must make sure the PowerBook SCSI Disk Mode control panel is set up with the correct SCSI ID information. Do not use a SCSI ID that is already in use by other devices on the SCSI bus.

Here are the steps to connect a PowerBook in SCSI Disk Mode to a Power Macintosh G3 (Blue and White):

1. If necessary, disable the PowerBook password security option.
2. Set up the SCSI Disk Mode control panel to use a unique SCSI ID.
3. Shut down the PowerBook.
4. Shut down the Power Macintosh G3 (Blue and White).
5. Connect the HD50 to 25 Pin adapter to the SCSI card's external connector.
6. Connect a standard SCSI system cable to the adapter.
7. Connect a PowerBook HDI-30 Disk Adapter cable to the SCSI System Cable.
8. Connect the small connector on the HDI-30 Disk Adapter cable to the SCSI port on the back of the PowerBook.
9. Turn on the PowerBook; this should display the SCSI symbol with the SCSI ID number in the middle of it on the screen.
10. Turn on the Power Macintosh G3 (Blue and White).

The PowerBook's hard disk volume(s) should show up on the desktop of the Power Macintosh once the computer has started up.

Note: The Apple Single Channel Ultra2 SCSI PCI card may not function correctly with the PowerBook in SCSI disk mode, treating the SCSI bus as unterminated. In that case, multiple hard drive icons will appear on the desktop of the Power Macintosh G3 (Blue and White). This is an issue with the way that the card interacts with the PowerBook SCSI Disk mode software.

Macintosh: "Port in Use" Alert With Palm Computing Software

This document explains what you should do if you see an alert box with a message that says "HotSync can not be enabled because the port is in use by another application."
This article has been archived and is no longer updated by Apple.

Symptom

When your computer starts up or when you try to enable HotSync settings, an alert box with this message appears:

> "HotSync can not be enabled because the port is in use by another application."

Solution

Please refer to Palm Knowledge Finder document 5906 for more specific information:

http://www.palm.com/support/macintosh/portinuse.html

If other software is open that is dedicated to using the serial port chosen in HotSync Manager, this alert can be expected to occur.

Here is a three-step process:

1. Use the AppleTalk control panel to verify that AppleTalk is not active through this port. Either set AppleTalk to another port, or while in the Advanced User Mode (Edit menu: User Mode) click the Options button and choose Make AppleTalk inactive. Try again to enable HotSync in HotSync Manager.
2. Disable any other software dedicated to using the serial port chosen in HotSync Manager. This may include fax or modem software. (You may need to turn off these extensions with the Extensions Manager control panel; refer to the documentation that came with the software or serial device for more information.) Restart the computer, and try again to enable HotSync in HotSync Manager.
3. If the error message persists at startup, it is because you have a conflict with other software as described above, and HotSync Manager is set to be enabled at system startup. In HotSync Manager, under HotSync options, deselect the box labeled "Enable HotSync software at system startup."

For more information, contact Palm.

For more information on troubleshooting extension conflicts, please read "Resolving system extension conflicts" in Mac OS Help, or read technical document 30929: "**Mac OS 8.x: Extensions Troubleshooting/Extensions Manager Features**".

For more information about the "port in use" error, and how to make AppleTalk inactive using the AppleTalk control panel, read technical document 24346: "**Mac OS: AppleTalk "Port In Use" Error**".

AppleWorks: Document Recovery Techniques

This article explains how to recover AppleWorks (or ClarisWorks) documents that have become unusable, or "damaged."

This article has been archived and is no longer updated by Apple.
Unless specifically stated otherwise, all references to AppleWorks in this article also refer to ClarisWorks.

AppleWorks cannot recover unusable Communications documents.

If you cannot open the document

Programs are available from third-party companies that can open unusable files. One of these may successfully open and recover your AppleWorks document.

With ClarisWorks 5 or later, and with all versions of AppleWorks, you may be able to insert the unusable document into a new document, using these steps:

1. Open AppleWorks.
2. Open a new document of the same type as the unusable document. For example, open a new word processing document if you have an unusable word processing document. If you are recovering a database document, create a new database document whose fields are the same as those in the unusable database document.
3. From the **File** menu, choose **Insert**. A dialog box appears.
4. Select the unusable document.
5. Click Insert.
6. Save the new document with a different name.

If you can open the document

This procedure may recover any data in the document, but may lose some of its formatting (font styles and sizes, spreadsheet calculations, database layouts and field names, and so forth).

Step 1

Open the document.

Step 2

Choose Save As from the File menu. In the dialog box that appears, choose a file format that is different than the native AppleWorks file format from the File Format pop-up menu. For example, save an AppleWorks word processing document as a Rich Text Format (RTF) document.

Various versions of ClarisWorks and AppleWorks have different Save As file format options. This is particularly true between Mac OS and Windows versions of the program. Further, your computer may have additional translators installed. Therefore, you may not have the same set of choices shown in the table below. The table shows various file formats for each type of AppleWorks document, ordered from the most likely to the least likely to successfully recover your unusable document.

Document type	File format
Macintosh	
Word Processing(1)	RTF, Text
Drawing(2)	PICT, GIF, JPEG
Painting	GIF, JPEG, TIFF
Spreadsheet(2)	SYLK, ASCII Text, DBF
Database(3)	SYLK, ASCII Text, DBF
Windows	
Word Processing(1)	Rich Text Format, Text File
Drawing(2)	Macintosh Picture File, BMP File, Microsoft Windows Metafile
Painting	Macintosh Picture File, BMP File, Microsoft Windows Metafile
Spreadsheet(3)	SYLK Files, DBF, ASCII Text Files
Database(3)	SYLK, DBF, ASCII

Table Notes:

1. ASCII Text and Rich Text Format (RTF) are text-only file formats. ASCII omits all text attributes and saves only the text characters. RTF saves some text attributes such as the size, font, and style of the text. Neither format saves formatting such as Document, Paragraph, Section, Rulers or Tabs. Columns are omitted, for example.
2. If the Drawing contains text, move the text to Word Processing, and recover it as a separate Word Processing document. Copy and paste to move the text.
3. SYLK, DBF, DIF, and ASCII are types of spreadsheet files. Using SYLK format saves the calculations in a database or spreadsheet, while the other formats only save the results of the calculations.

After choosing a file format, give the document a unique name and click Save. If an alert box appears while saving, note the error message for future reference. Then try saving the document using a different file format.

Step 3

Close the document.

Step 4

Open the newly created document by choosing Open from the File menu. A dialog box appears. Choose the correct document type from the Document Type pop-up menu, and choose the correct file format from the File Format pop-up menu. Click Open.

If an alert box appears while the document is opening, note the error message for future reference. Then try this procedure again, starting at Step 1 with a different file format.

Step 5

Save the document in its native AppleWorks format.

Use the newly saved AppleWorks document and avoid the older, unusable document.

AppleWorks: Paintable Area and Margins in Paint Documents

This article explains how to change both the page margins and paint area in an AppleWorks paint document.
This article has been archived and is no longer updated by Apple.
In ClarisWorks 2.0 through AppleWorks 5.0.3, page margins and the size of the paint area, in pixels, are independent of each other. When you set the page margins in a paint document, you must change the pixels to enlarge or reduce the work area.

Changing the Work Area

1. Choose Document from the Format menu.
2. Enter the new page margins (if required) in the Document window.
3. Enter the new work area in the size section of the Document window.
4. Click OK.

How to Determine the Number of Pixels in a Work Area

1. Determine your page margins.
2. Add the left and right margins together.
3. Subtract the sum of the left and right margins from 8.5.
8.5 is the page width in inches.
4. Multiply the result by 72.
(one inch = 72 at 72 DPI or 300 at 300 DPI)
5. Enter this result in Pixels Across.
6. Add the top and bottom margins together.
7. Subtract the sum of the top and bottom margins from 11.
11 is the page length in inches.
8. Multiply the result by 72.
9. Enter this result in Pixels Down.

Example

To change the margins from 1-inch to one-half inch (0.5), the pixel size would be

- .5 +.5 = 1
- 8.5 - 1 = 7.5
- 7.5 x 72 = 540 pixels across
- .5 +.5 = 1
- 11 - 1 = 10
- 10 x 72 = 720 pixels down

If you want to use a different paint resolution substitute that screen size in place of 72.

QuickTime Streaming Server: Making Streamable Files Available

How are streamable, stored movies made available for streaming through QuickTime Streaming Server?
This article has been archived and is no longer updated by Apple.
Here are the steps for making streamable files available with QuickTime Streaming Server (QTSS):

Step One
Verify that the released version of QTSS has been installed. Type the following in a terminal window:

```
QuickTimeStreamingServer -v
```

It should produce information including:

```
QTSS/v66 Built on: Apr 16 1999 , 18:10:07
```

Step Two
Verify the location of the "Movies" directory. The Movies directory contains all files that will be made available through QTSS. The location of this directory listed in the Admin application. (In the Apple menu, under Administration, open QuickTimeStreamingServerAdmin.)

Step Three
Place self-contained, hinted movies in the Movies directory. Note that the server does **not** need to be restarted when movies are added. It must be restarted only if settings for the server are changed.

Step Four
Verify that QTSS is running. In the Admin app, the status will indicate if the server is running. If needed, start the server here. The process may also be viewed in the process list in the Applications menu or in terminal.app with this command:

```
ps ax |grep QuickTimeStreamingServer
```

There are two processes with this name.

At this point, a client request should have access to files in the Movies directory. With the QuickTime 4 (or later) client, pull down the File menu and choose Open URL. In the resulting window, type the server name and file name in the following format, where filename.mov is a file available on the server at the root level of the Movies directory:

```
rtsp://servername/filename.mov
```

PowerBook G3 Series: Video Controllers

I have a PowerBook G3 Series computer and want to know what type of video controller it uses.
This article has been archived and is no longer updated by Apple.
The original PowerBook G3 Series computer, released in May 1998 (Family number M4753), uses the the ATI 3D RAGE LT video controller.

The PowerBook G3 Series computer configuration released in September 1998 (Family number M4753) uses the ATI RAGE LT Pro video controller. You can differentiate this PowerBook G3 Series configuration from the previous configuration because it has multiple resolutions built-in.

The PowerBook G3 Series (Bronze keyboard) computer released in May 1999 (Family number M5343) also uses the ATI RAGE LT Pro video controller but has additional VRAM (8MB) and a different architecture, which allows Simulscan (Mirroring) and Extended Desktop mode. Extended Desktop mode was not built into the earlier configurations, but is available through third-party PC card solutions.

For additional information, please visit the following site: **http://www.ati.com**

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"
Published Date: Feb 20, 2012

Power Macintosh G3: Identifying The Logic Board Revision

Some Apple articles and third party product documentation mention different logic board revisions in platinum colored Power Macintosh G3 computers. This article tells how to identify which revision you have.
This article has been archived and is no longer updated by Apple.
Apple, Inc. may make revisions or changes to a product line at any time without notification. This is noted in the materials that came with your computer.

Note: The following information does not apply to Power Macintosh G3 (Blue and White) computers.

Use the Apple System Profiler, located in the Apple menu, to help determine which logic board revision you have. Open Apple System Profiler, click the System Profile tab within the window, and then look at the Production Information section. Compare it to the table below to determine which revision of the logic board is in your Power Macintosh G3 (platinum) computer.

ROM Versions	Logic Board Revision
$77D.40F2	**revision 1**
$77D.45F1	**revision 2**
$77D.45F2	**revision 3**

Note: All Power Macintosh G3 All-in-one computers and (platinum) Power Macintosh G3 300Mhz and 333Mhz Desktop/Minitower computers have revision 2 or newer logic boards.

If further identification of this or any Apple hardware component is needed, you should contact an Apple-authorized service provider in your area. To find the nearest Apple-authorized service provider visit: http://buy.apple.com/ .

Imation SuperDisk Disk Drive: Ejecting Disks During Installations

This article describes how to eject a floppy disk from an Imation SuperDisk disk drive in situations where the disk does not eject. Typically this happens during software installation.
This article has been archived and is no longer updated by Apple.
Version 1.0 of the USBSuperDiskDriver extension might not eject the first floppy disk during certain software installations which require multiple floppy disks.

Imation has updated the drivers to remedy this situation. Versions 1.1 and later are not affected by this issue. You can download the latest version of the SuperDisk software from Imation's web site.

Version 1.31 of the USBSuperDiskDriver extension is included as part of Mac OS 8.6.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

USB: Keyboard Should Not Be Plugged Into USB Hub

If a Universal Serial Bus (USB) keyboard is plugged into a self-powered USB hub, pressing the keyboard's Power key does not start up the computer. However, if the keyboard is plugged into the computer the Power key works.
This article has been archived and is no longer updated by Apple.
This behavior is normal as most USB hubs do not become active until they receive a signal from the computer.

If the computer will not power on with the keyboard plugged into a hub, you must either use the power button on the front of the computer or plug the USB keyboard directly into the computer.

Note: On USB equipped PowerBooks in closed clamshell mode, the power on button is not accessible.
Published Date: Feb 20, 2012

QuickTime Streaming Server: Determining Adequate Server Bandwidth

What connection size (bandwidth) do I need for my QuickTime Streaming Server configuration?
This article has been archived and is no longer updated by Apple.
If all of the expected connections for your QuickTime Streaming Server are the same size, then computing your needed bandwidth is relatively simple. Multiply the maximum number of users you expect to support by the bit rate of the files they will view. Here are two examples:

Thirty clients viewing 1.5 megabits per second (Mbps) files would take up a 45Mbps connection which could be carried on 100Mbps Ethernet LAN.

One thousand clients viewing 22 kilobits per second files (Kbps) would take up a 22Mbps connection which could be carried on 100Mbps Ethernet LAN or externally on a fractional T3.

If the bit rates differ between the files (for example, you serve both over the Internet with 22Kbps files and on a LAN with 1.5Mbps files) your connection is more difficult to compute. You may use the formula above **but** keep in mind that there is no check on the client's bandwidth use. If you allow five hundred users, there is no method to require four hundred of them to connect to the smaller files. The total bandwidth of the server can be set so that as soon as that bandwidth is reached, new users will be turned away until current users disconnect from the server.

Consider that the server may take the entire bandwidth up to the maximum set in the Admin. Also, consider that other network traffic is not part of this calculation; if there are other services on the network, take care to plan for a network and QuickTime Streaming Server configuration that will allow all the expected traffic.

AppleShare IP Mail Server: Protecting Against Unsolicited Email

Unsolicited commercial email, sometimes called "spam", is generally sent out in large batches frequently through mail servers that are unprotected. This document explains features available in the AppleShare IP 6 mail server that help protect your server against spam.
This article has been archived and is no longer updated by Apple.
On a protocol level, Simple Mail Transfer Protocol (SMTP; the protocol for sending email from one server to another) is not secure and provides no user authentication. Any user can connect to an SMTP server and send mail to any other user. Because of this, email servers usually implement their own form of user authentication and protection against unauthorized users. In addition to this, network administrators often design network firewalls to prevent abuse of the company mail server.

AppleShare 6 provides some features to help administrators prevent unauthorized users sending email through the AppleShare mail server.

Prohibit SMTP Relay

If your mail server is on the Internet, an unknown user could potentially use your server to relay a large batch of emails to other users anywhere on the Internet. You can prevent this by editing the default host profile and enabling the "Deliver mail from this host to local addresses only (no SMTP relay)" option. When this is turned on, the mail server will look at the "MAIL FROM" and RCPT TO" commands of the SMTP session. If the mail is coming from another server, then it must be sent to a user on this server. The mail server will reject email if a remote server connects to the AppleShare mail server to send mail to a third server.

By modifying the default host profile, you are ensuring that any new host that connects to the mail server will have SMTP relay disabled. If you do this when you first set the server up (before an extensive host list is created), that will ensure that all hosts will be unable to use the mail server as an SMTP relay.

Check For Local Users

This is an added protection to the step above. Rather than just looking at the host part of the email address listed in the "from:" field, the mail server verifies that the user from whom the mail is coming is a valid user in the User & Group list, and that the user has mail enabled.

This option is located in the Mail Server Settings window, under the "Mail In" tab.

Reject Mail For A Specific Host

The AppleShare IP mail server also gives you the ability to reject mail on a host-by-host basis. If you notice that you are receiving unwanted email from a particular host, you can edit that host in the host list to reject all incoming mail from that server.

TCP Filtering (Requires Mac OS 8.5 & AppleShare 6.1 And Later)

SMTP works over TCP/IP port 25. TCP Filtering (available with AppleShare 6.1 and later) will block this port, effectively blocking all incoming and outgoing email with a specified IP address (or range of IP addresses).

TCP filtering works on a lower level of network protocols than the mail server. If you are blocking a mail server with TCP filtering, your AppleShare IP mail server will not even know that the remote user is trying to connect. From the remote server's perspective, the AppleShare mail server is not on the network. Also TCP Filtering works on IP addresses, rather than Host names as the mail server does.

RealTime Black Hole List (AppleShare 6.2 and later)

The AppleShare IP mail server allows you to prevent unwanted mail by checking and blocking a connection. When you enable this option, the mail server compares the incoming connection's originating address against an active list on a server maintained by a private company. If the originator is on this list, the connection is refused and the originator's mail will not be delivered to the users on your AppleShare IP mail server.

This option is located in the Advanced Server Settings under the Anti-Spam tab. The checkbox titled "check Incoming SMTP Connections" allows you to enable/disable the option. The default server is the Realtime Blackhole List.

Reject Connection If Name Does Not Match Address (AppleShare 6.2 and later)

Mail servers identify themselves when they start a connection (with the HELO command). The mail server verifies the self-reported name against a reverse DNS lookup of the IP address. If the two do not match, the connection is terminated. While this command can prevent unsolicited email, it can also keep you from receiving legitimate email from servers that are misconfigured.

This option is located in the Advanced Mail Server Settings under the Anti-Spam tab. You must first enable "Log connections if SMTP name does not match address" to enable this option.

QuickTime 4: Support For TIFF File Format

I heard that QuickTime 4 supports Tagged-Image File Format (TIFF). However I cannot get some TIFF images to open using QuickTime. Why is this?
This article has been archived and is no longer updated by Apple.
QuickTime 4 does indeed support the TIFF file format, as do previous versions of QuickTime. However, there are several different compression formats used by TIFF, and not all of them are currently supported by QuickTime 4.

Supported TIFF codecs

- None
- PackBits
- LZW
- CCITT 1D

Unsupported TIFF codecs

- Group 3 Fax
- Group 4 Fax

Published Date: Feb 20, 2012

Japanese Language Kit: Selecting The Kana Keyboard

This article describes how to select a Kana Keyboard within the Japanese Language Kit (JLK), so users may input Katakana characters that match the keyboard labels that came with the JLK.
This article has been archived and is no longer updated by Apple.
Reference is made to a Kana Keyboard in the Japanese Language Kit Input Method Guide (copyright 1993; pages 10, 50 and 51 for example), and in the Installation and User's Manual (copyright 1995; page 12 for example). Some customers find it unclear whether the documentation refers to an actual hardware keyboard, distinct from the Apple keyboard, or to a specific setting within the JLK. The Kana Keyboard is selected within the Kotoeri (Japanese Input Method) preferences dialog, not from within the Keyboard control panel, or the Keyboard menu.

Because the menus and preference settings for the JLK are in Japanese, it may be difficult for a non-Japanese speaker to identify the appropriate selections to make. The steps below will identify the appropriate selections with graphical clues that allow a non-Japanese speaker to correctly select the Kana Keyboard and thereby enable one-keystroke Katakana input.

To select the Kana Keyboard, so that a user may enter Katakana characters with one keystroke (entering characters which match the keyboard labels provided with the JLK), follow these steps:

Step One: Switching to the Japanese Input Method

Figure 1: The Keyboard menu.

Select the Kotoeri input method from the Keyboard menu in the upper right corner of the menubar, just to the left of the Applications menu. The Keyboard menu icon is a blue diamond when a US input method is selected. The icon for the Kotoeri input method is a red circle with a 6-color Apple logo over it.

Note: If you are trying to change input methods while in the Finder, and the Kotoeri input method is dimmed in the Keyboard menu, you must set your Views Font to Osaka. For more information, see the following Tech Info Library article:

Article 17999: "**Japanese Language Kit: Common Troubleshooting Steps**"

Step Two: Opening the Kotoeri Preferences Window

Figure 2: The Pencil menu.

When the Kotoeri input method has been selected, a Pencil menu appears just to the left of the Keyboard menu (its icon in the menubar is a pencil). Select the Preferences option from the Pencil menu. The Preferences option can be identified in the menu by its keyboard shortcut, option-shift-U. You can also click the Preferences button in the Kotoeri input method palette.

Step Three: Changing the Keyboard Input Setting

Figure 3: Keyboard Layout pop-up menu.

The Keyboard Layout pop-up menu is above the Punctuation pop-up menu (both menus are directly above the OK and Cancel buttons, which are in a recognizably standard position within the window). The Keyboard Layout pop-up menu contains two options. The first option, which is the default, is for Roman input. The second option is for Kana input. Select this option. Press the Return key on your keyboard or click the button with the black ring around it to exit the Preferences window and save the new setting.

Step Four: Using the Kana Input Method

Figure 4: Window with palette.

Open the SimpleText Japanese application, or another WorldScript compliant application, switch to the Kotoeri input method, select the Katakana button on the Kotoeri palette, and type several keys. Each keystroke will result in a Japanese katakana character being displayed on the screen, which should correspond to the keyboard labels that were included with the JLK. This behavior is different from the default input method for the JLK, in which a sequence of keystrokes generates a series of Roman letters on the screen, which are converted to Kana as you type.

For a description of the terms Kanji and Kana, see the following Tech Info Library article:

Article 3199: "**Japanese Language Kit: Definition of Kanji, Kana, and Romaji**"

Published Date: Feb 20, 2012

Apple Remote Access: No DNS Servers When Using PPP

I am using Remote Access to dial out to the Internet. Even though I set the TCP/IP control panel to configure using the PPP server, I do not see the DNS server field populated, and I cannot see any sites once I am dialed in to my Internet Service Provider (ISP).
This article has been archived and is no longer updated by Apple.
Support for handling DNS negotiation was a feature added in Apple Remote Access 3.1, which shipped with Mac OS 8.5. If you are using the version of Remote Access bundled with 8.5 or later, you will not see the numbers displayed in the TCP/IP control panel, but they will be honored and used for DNS lookups. If the servers obtained automatically fail to respond, the addresses entered into the TCP/IP control panel will be used next.

If you are using a version of Remote Access client earlier than version 3.1, you must manually enter any DNS server addresses that you want to use. Your ISP or network administrator can supply you with this information.

Note that the most current version of ARA Personal Server as of July 1999 is 3.0.2. If you have installed the Apple Remote Access Personal Server on your computer, you must manually enter valid DNS addresses, and this feature is not supported.

Power Macintosh G3 (Blue and White) and G4: Small Gap In Internal Cable

This article describes the small gap in the IDE ribbon cable connected to the CD-ROM drive.
This article has been archived and is no longer updated by Apple.
This cable is called the IDE/ATA ribbon cable and connects the CD or DVD drive, and Zip drive to the logic board. This connector is located on the left side of the logic board, near the hard drive(s), and is closest to the rear panel. The small hole or gap is 1mm x 4mm and is on the 67th lead (counting from the first lead at the rear of the computer) of the cable shown in Figure 1.

Figure 1: IDE/ATA ribbon cable (gap highlighted).

The IDE/ATA ribbon cable was designed to have this small gap, there is no need to have the cable or computer serviced.

QuickTime: Error Messages On Startup

This article explains why you may receive alert messages appear during startup stating that there was an error starting up QuickTime Musical Instruments or QuickTime PowerPlug.
This article has been archived and is no longer updated by Apple.
Some multimedia programs install older versions of QuickTime, replacing certain extensions and causing the remaining extensions not to load. This causes the error messages. Consequently, all sound and video functions are disabled.

Important: If you purchased QuickTime Pro, make sure to write down your registration key before you go any further.

To remedy the situation, open the Extensions folder (inside the System Folder) and move the following files to the Trash:

- Sound Manager
- QuickTime Extensions folder (if present)
- QuickTime
- QuickTime MPEG Extension
- QuickTime Musical Instruments
- QuickTime PowerPlug
- QuickTime VR

Next, reinstall QuickTime. If you were using the version of QuickTime that came with your computer, you can custom install QuickTime from the system CD that came with it (iMac owners, use the Software Install CD). If you downloaded QuickTime from the Internet, run the installer that you downloaded or, if you've installed QuickTime 4.x, run the QuickTime Updater from the QuickTime Folder on your hard disk.

You can find the latest version of QuickTime at:

http://www.apple.com/quicktime/

Mac OS: Application Will Not Open Due To "Lib File Not Found" Errors

Sometimes when I try to open an application program I get an error message such as:

"The application <name> could not be opened because "<some>Lib" could not be found."

The file that the computer could not find always has "Lib" in its title. Is there some common thread to this kind of error message?

This article has been archived and is no longer updated by Apple.
Yes. "Lib" is short for "Library." System software can be packaged as reusable libraries. The same libraries can be used by many different applications or control panels. For this reason, they are called "Shared Libraries." Shared Libraries are most commonly contained in pieces of the system software such as the System suitcase file, System Resources, Mac OS ROM or extensions.

Unfortunately, any of these can (and almost always do) contain many shared libraries. Therefore, the error messages referring to the missing library do not always refer to a specific file. However, the error message can still help you narrow down to a few files.

For example:

Suppose you try to open the File Sharing control panel and get a message about "OTUtilityLib" missing. If you know that "OT" is a common abbreviation for "Open Transport", the networking software for Mac OS (since System 7.5.2), then you would know to look for extensions with "Open Transport" in the title. This makes sense since the File Sharing control panel is for letting us share files over a network. Naturally, we need the networking software.

In this case, some of the required files also have names starting with "OpenTpt". Sometimes the abbreviation of file names makes this harder than it would otherwise be.

You can get these error messages if the file is disabled in the Extensions Manager control panel, missing from the hard drive altogether or damaged.

To turn on disabled extensions:

1. Open the Extensions Manager control panel.
2. Find extensions that seem like they might be related and turn them on.
3. Click the restart button and try again.

Alternately, you can use the "Mac OS" sets of extensions to turn on Apple sets. The sets provided by Apple have all the pieces that Apple requires for the system software to work. However, it only turns on the files that are disabled. If the files are not on the hard drive at all, or are outside the System Folder, you must reinstall them.

To reinstall missing or damaged extensions:

1. Run the system software installer for Mac OS or Apple Software Restore CD that came with your computer.
2. If you are running the Mac OS installer (but **not** an Apple Software Restore CD), then you can choose a customized package with just the component that you are trying to reinstall. This is the quickest way to re-install a few things. This will not touch parts of your System Folder whose components you are not reinstalling.

AppleShare IP Mail 6.x: Configuring For A Network Address Translation (NAT) Environment

How do I set up an AppleShare IP 6.x Mail Server within the private network set up by a router that performs Network Address Translation (NAT, also known as IP Masquerading)?
This article has been archived and is no longer updated by Apple.
There are five main steps to setting up ASIP 6.x mail services inside a NAT environment:

1. Configuring external DNS.
2. Mapping incoming traffic.
3. Setting up the AppleShare IP (ASIP) Host Name list.
4. Configuring internal DNS.
5. Changing the SMTP Response Name.

Step One: Configuring External DNS

You must coordinate with your Internet Service Provider (ISP) to set up external DNS. Your ISP must configure DNS so that there is a permanent host name (or A Record) for the public IP address of the NAT router.

If you have your own domain name, you may also want your ISP to set up a mail exchange record (MX Record) in their DNS so that any mail addressed to your domain name will be sent to the NAT router through the NAT router's permanent host name.

For example, if your ISP created a host name (A Record) of "mail.company.com" for your public IP address, any email sent to user@mail.company.com would be sent to your NAT router. If your ISP created an MX Record for "company.com", any email sent to user@company.com would be sent to mail.company.com, which is again your NAT router.

For specifics on how DNS should be set up to handle a mail server, see the following article:

Article 24693: "**AppleShare IP Mail Server: DNS Configuration**"

Step Two: Mapping Incoming Traffic

Once you have service directed to your NAT router, you need to configure the NAT router to forward email traffic to your mail server.

You will need to map incoming SMTP traffic (TCP port 25) on the NAT router to the private, internal IP address of the machine running the AppleShare IP Mail Server. This tells the NAT router to send all SMTP traffic to the mail server.

If you want to provide external mail retrieval, you must also map POP3 (TCP port 110) and/or IMAP (TCP port 143) on the NAT router to the private IP address of the mail server. This will allow email clients to connect to the mail server through the NAT router.

See the documentation for your particular NAT product for help setting up these port mappings.

Step Three: Setting Up the ASIP Host Name List

The ASIP Mail Server now needs to be configured to recognize that any email addressed to the public host name (for example, mail.company.com) should be considered local.

1. Launch AppleShare IP Mail Admin.
2. Start the Mail Server.
3. Choose "Show Host List" from the Server menu.
4. Click the "New Host" icon in the Host List window.
5. Enter the public host name of the NAT server (for example, mail.company.com).
6. Wait for this host to appear in the host list.
7. Select the host name you just entered.
8. Click the "Edit Host" icon.
9. Click the tab labeled "Mail To".
10. Check the box labeled "Relay all SMTP mail via".
11. Enter the private IP address of the ASIP mail server.
12. Click "Save" and close the window.

The ASIP Mail Server will now treat this host as "itself" and properly deliver the mail to the mail accounts on the local system instead of trying to forward the mail back to the public host name.

Note: The Host List window will not immediately list the host as "local". Instead, the first time the mail server encounters a message with a recipient for that host name, it will "resolve" the host and mark it as local. This process is deferred to avoid unnecessary DNS traffic until the mail server uses the hostname for the first time.

At this point, email services are fully configured for sending and receiving email through the outside network. Email clients on the outside network should now be configured as follows:

SMTP server: <public host name>
POP/IMAP server: <public host name>
Account name: user@public_host_name

The domain name may be substituted for the public host name if a mail exchange record has been set up.

If you have not configured internal DNS, any email clients trying to connect to the server from within the private network must be configured by IP address. If internal DNS has not been set up, mail clients on the private network should be configured as follows:

SMTP server: <private IP address of server>
POP/IMAP server: <private IP address of server>
Account name: user@public_host_name

The domain name may be substituted for the public host name if a mail exchange record has been set up.

Note: If internal DNS is not set up, the mail server error logs will show reverse lookup errors on mail server startup. For more information, see the following article:

Article 24689: "**AppleShare IP Mail Server: Shows IP Address Instead Of DNS Name**"

Step Four: Configuring Internal DNS

Configuring internal DNS allows clients on the private network to connect to the server by host name instead of by IP address.

If you are using MacDNS for your internal DNS, see the MacDNS Administrator guide for a full explanation of how to set up MacDNS. For help with basic setup, see the following article:

Article 31067: "**Mac DNS: Configuration & Setup**"

When you set up internal DNS, note the following two points:

1. The TCP/IP settings on all machines inside the NAT router (including the mail server) must point to the internal DNS.
2. The parent server of the internal DNS must be set to the public IP address of one or more of your ISP's DNS servers. This allows the ISP's name server to resolve any host names not specified in the internal DNS.

Once internal DNS is configured, email clients on the private network should be configured as follows:

SMTP server: <internal host name of server>
POP/IMAP server: <internal host name of server>
Account name: user@public_host_name

The domain name may be substituted for the public host name if a mail exchange record has been set up.

Step Five: Changing the SMTP Response Name

Finally, to ensure that other mail servers accept your email, you should set the name of the SMTP in and out response name to match your public host name.

In AppleShare IP Mail Admin:

- Open the Advanced Settings under the Server menu.
- Select the Protocols tab.
- For SMTP in and out, enter the public host name of the NAT router.

- Click "Save" and close.

AppleShare IP 6.2 : Sherlock Share Point indexing

I can index the volumes of my AppleShare server, but in order to perform a Sherlock search, I have to be logged in as the Admin or otherwise have access to the server volumes' root level. How can I index the Share Points so that my users can perform Sherlock searches with their own user logins?

This article has been archived and is no longer updated by Apple.

When a volume is indexed from within the Sherlock application an invisible index file is written to the root level of that volume. AppleShare IP 6.2 allows one to perform indexing on a per Share Point basis. This method instead writes a similar index file to the root of the Share Point. With previous versions of AppleShare IP, Sherlock searches could only be conducted if a user had read access to the entirety of a given volume.

Indexing a Share Point through AppleShare IP 6.2 allows the administrator to set Find By Content privileges. The following steps will create a searchable Share Point:

Step One
Launch the AppleShare IP Web & File Admin.

Step Two
Select the "Show Disks & Share Points" item under the Server menu.

Step Three
Create a Share Point or select an existing one that you desire to have indexed.

Step Four
Set Privileges for that share point and click the "Sherlock Indexing..." button in the Privileges window. See Figure 1.

Figure 1: Privileges window.

Step Five
Set access privileges to the index based on the access privileges set for the share point. See Figure 2.

Figure 2: Setting privileges to the index.

Step Six
Mount the configured Share Point and perform a Find By Content search.

Mac OS: Matching Mac OS ROM File To Mac OS Version

This document contains a chart that matches the various versions of the Mac OS ROM file with the correct version of Mac OS. Your computer must have the appropriate Mac OS ROM file in order to function properly.
This article has been archived and is no longer updated by Apple.
Your computer must have the appropriate Mac OS ROM file for the version of Mac OS that is installed. Using the wrong Mac OS ROM file can cause the computer to behave unpredictably and may even prevent it from starting up.

The chart below matches the applicable Mac OS ROM file to the applicable Mac OS.

Mac OS	Mac OS ROM Version
Mac OS 8.1 (iMac, Rev A Bundle)	1.1
iMac Update 1.0	1.1.2
Mac OS 8.5 (Retail CD)	1.1.2
Mac OS 8.5 (iMac, Rev B Bundle)	1.1.5
Power Macintosh G3 (Blue and White) Mac OS 8.5.1 Bundle	1.2
Macintosh Server G3 (Blue and White) Mac OS 8.5.1 Bundle	1.2
iMac Update 1.1	1.2.1
Mac OS 8.5.1 (Colors iMac 266 MHz Bundle)	1.2.1
Mac OS 8.6 (Retail CD)	1.4
Mac OS 8.6 (Colors iMac 333 MHz Bundle)	1.4
Power Macintosh G3 (Blue and White) Mac OS 8.6 Bundle	1.4
Macintosh PowerBook G3 Series 8.6 Bundle	1.6
Mac OS ROM Update 1.0	1.6
Mac OS 8.6 bundled on Power Mac G4 (PCI)	1.7.1
Power Mac G4 ROM 1.8.1 Update	1.8.1
Mac OS 8.6 bundled on iMac (Slot Loading)	2.3.1
Mac OS 8.6 bundled on iBook	2.3.1
Mac OS 8.6 bundled on Power Mac G4 (AGP)	2.5.1
Mac OS 9.0 bundled on iBook	3.1.1
Mac OS 9.0 bundled on Power Mac G4 (AGP Graphics)/ iMac (Slot-Loading)	3.1.1
Mac OS 9.0 bundled on PowerBook G3 Bronze	3.0
Retail Mac OS 9.0 installed on iMac	3.0
Retail Mac OS 9.0 installed on Power Macintosh G3 (Blue and White)	3.0
Mac OS 9.0.2 bundled on Power Mac G4 (AGP) and iBook	3.5
Mac OS 9.0.2 installed on PowerBook (FireWire)	3.5
Mac OS 9.0.3 bundled on iMac (Slot Loading)	3.6
Mac OS 9.0.4 Retail/Software Update	3.7
Mac OS 9.0.4 installed on PowerBook (FireWire) (Summer 2000) (CPU software 2.4)	3.7

Ethernet Update 1.0	3.8
Mac OS 9.0.4 installed on iMac (Summer 2000)	4.6.1
Mac OS 9.0.4 installed on Power Mac G4 (Summer 2000)	4.6.1
Mac OS 9.0.4 installed on Power Mac G4 MP (Summer 2000) (CPU software 2.3)	4.9.1
Mac OS 9.0.4 installed on Power Mac G4 (Gigabit Ethernet)	4.9.1
Mac OS 9.0.4 installed on Power Mac G4 Cube (CPU software 2.4)	5.2.1
Mac OS 9.0.4 installed on iBook (Summer 2000) (CPU software 2.5)	5.3.1
Mac OS 9.0.4 installed on Power Mac G4 (with Radeon) (CPU software 2.6)	5.5.1
Mac OS 9.1 installed on iMac (Early 2001)	7.5.1
Mac OS 9.1 installed on iMac (Summer 2001)	7.5.1
Mac OS 9.1 installed on Power Mac G4 (Digital Audio)	6.7.1
Mac OS 9.1 Update	6.1
Mac OS 9.2 installed on iMac (Summer 2001)	8.3.1
Mac OS 9.2 installed on Power Mac G4 (QuickSilver)	8.3.1
Mac OS 9.2.1 Update	8.4
Mac OS 9.2.1 installed on Power Mac G4 (QuickSilver)	8.4
Mac OS 9.2.2 Update	8.7
Mac OS 9.2.2 installed on iMac (Summer 2001)	9.0.1
Mac OS 9.2.2 installed on iMac (Flat Panel)	9.0.1
Mac OS 9.2.2 installed on eMac	9.2.1
Mac OS 9.2.2 installed on Power Mac G4 (QuickSilver 2002)	9.0.1
Mac OS 9.2.2 installed on PowerBook G4 (12-inch)	Classic only. Cannot start up in Mac OS 9.
Mac OS 9.2.2 installed on PowerBook G4 (17-inch)	Classic only. Cannot start up in Mac OS 9.
Mac OS 9.2.2 installed on Power Mac G4 (FW 800)	Classic only. Cannot start up in Mac OS 9.
Mac OS 9.2.2 installed on iMac (17-inch Flat Panel)	9.5.1
Mac OS 9.2.2 installed on iMac (17-inch 1GHz)	Classic only. Cannot start up in Mac OS 9.
Mac OS 9.2.2 installed on iMac (USB 2.0)	Classic only. Cannot start up in Mac OS 9.

Note: The parenthetical product descriptions (Summer 2000) and (Summer 2001) refer to the summer of the Northern Hemisphere.

AppleWorks 5.x: Error Printing Fax Cover Sheet 3

When I attempt to print the "Fax Cover Sheet 3", a stationery document that is included with AppleWorks 5, the document does not print properly; a PostScript error is displayed. How can I print this document?
This article has been archived and is no longer updated by Apple.
If you receive a PostScript error when attempting to print the Fax Cover Sheet 3, try this workaround:

1. Open the Fax Cover Sheet 3 stationery.
2. Click on the graphics of the fax machine. (Four grow handles should appear at each corner of the fax machine.)
3. Grab one of the grow boxes (click on it and hold the mouse button down) then shrink the size of the fax machine (drag the grow box).

You do not need to change the size of the graphic very much and after doing so, the document should now print. If it doesn't, merely reselect the graphics and change the size a bit more.

Additional information

The behavior was verified with AppleWorks and ClarisWorks versions 5.x, on Macintosh computers using Mac OS 8.5.1 and 8.6. The error encountered is "undefined," and the offending command is @r.

Macintosh: Can I Have A Password At Startup?

Is there any way that I can have my computer prompt me for a password at startup? There is a Password Security control panel for PowerBooks, but will it work with my desktop computer?
This article has been archived and is no longer updated by Apple.
Using Mac OS 9's Multiple Users feature you can have a password at startup. If you need very strong security, or are not running Mac OS 9 you may need to purchase a third-party solution such as a screen saver, or other security software.

The Password Security control panel is not compatible with certain Macintosh computers, including:

- Desktop Macintosh computers such as the iMac or Power Macintosh G3.
- iBook

AppleShare IP: Users Cannot Save Name And Password

From my Macintosh I am unable to save my name and password for automatic log-on to the AppleShare IP file server; the option is dimmed. Can you help?

This article has been archived and is no longer updated by Apple.

Figure 1 shows the dialog box you describe. The option is dimmed because the setting "Enable users to save password for automatic log on" is disabled on the server.

Figure 1: Save My Name and Password is disabled.

The option to allow users to save their name and password can be enabled by running the AppleShare IP Web & File Admin program. Follow these steps:

1. From the server, open the AppleShare IP Web & File Admin program.
2. Choose Web & File Server Settings... from the Server menu. The window shown in Figure 2 will appear.
3. Select Password from the window's pop-up menu.
4. Enable the checkbox titled "Enable users to save password for automatic log on."

Figure 2: Web & File Server Settings window; Password options displayed.

Sherlock: Find By Content Indexing Issues

When trying to index a hard disk, sometimes an error message appears saying the index stopped because there is not enough room on the disk. However, the disk has several megabytes of space available.

Also, Sherlock does not correctly update the index files under the Find By Content option. After deleting the FBC Indexing Preferences file, it still does not update the index files.

This article has been archived and is no longer updated by Apple.
Sherlock sometimes erroneously reports that the disk is full when there is sufficient room. If Sherlock encounters other disk errors, it may report the issue as insufficient disk space.

Since the Find by Content indexing relies upon the integrity of the hard disk, run Disk First Aid to verify that it is free from errors. Extensions or control panels may cause interference with the indexing operation, so check for extension or control panel conflicts or issues.

If Sherlock cannot properly index the hard disk, you can eliminate the index files and reindex the hard disk which creates new indexes. Here are the steps:

1. Quit Sherlock.
2. Delete the file named FBC Indexing Preferences; it is located in the Preferences folder within the System Folder.
3. Open Sherlock and click More Choices to enable a second search criteria.
4. In the first criteria line, set 'name is TheFindByContentFolder'. In the second criteria line, hold down the Option key to select visibility from the popup menu. The second criteria line should then read 'visibility is invisible'.
5. Click the Find button.
6. Select the found item in the Items Found window.
7. Choose Move To Trash from Sherlock's File menu. Click OK in the resulting dialog box; the item is deleted immediately.
8. Choose Index Volumes from Sherlock's Find menu.
9. In the Index Volumes window, select the desired disk for indexing, then click Update Index.
10. Click Update to index immediately, or Schedule for indexing later.

Drive Setup 1.7.x: Low Level Format Not Selectable For ATA Drives

It seems that Drive Setup 1.7 does not allow me to perform a low level format of my ATA hard drive; the option is dimmed. I tried newer versions of Drive Setup, and they behave the same. Can you explain?
This article has been archived and is no longer updated by Apple.
Beginning with Drive Setup 1.7, the low level format option for all ATA drives has been disabled. This test was not performing a low level format. This test instead wrote zeros and performed subsequent reads to verify drive calculated checksums on the written data. With the exception of the read portion, this test was the same as the write zeroes option. The combination of both tests and the larger capacity drives that Apple is shipping provides unnecessary redundancy at the expense of the user experience.

Drive Setup users can achieve the same functionality by selecting the "Zero all data" initialization option before initializing the hard drive followed by the Test Disk... function in the Function menu.

AppleWorks: Print Options Vary Depending Upon Print Driver

In the Macintosh version of AppleWorks, I have several print options that do not appear in the Windows version. Why is this?
This article has been archived and is no longer updated by Apple.
Many print options are specific to the printer driver used. Different printers yield different print options even on the same operating system.

For example, under Mac OS the LaserWriter 8 printer driver offers options for layout, font settings, and color matching while the StyleWriter 1200 driver does not. In turn, the StyleWriter 1200 driver offers a watermarks feature which is not available using LaserWriter 8.

In addition, the same model printer may offer different options when used on different platforms (Mac OS, Windows, UNIX, and so forth) since different platforms use different print drivers to print to the same printer model.

Customers interested in print features that are not available when using a particular printer driver should provide feedback to the manufacturer of the driver.

Sherlock, Sherlock 2: Finding Invisible Files or Folders

This article tells how to use Sherlock or Sherlock 2 to find invisible files or folders.
This article has been archived and is no longer updated by Apple.
Sherlock is a part of Mac OS 8.5 and 8.6. Sherlock 2 is a part of Mac OS 9.

As the name implies, invisible files and folders are those that cannot be seen in the Finder, whether they reside on the desktop or in a window. Invisible files and folders have an internal flag set that tells the Finder not to display them.

Important: A file or folder is typically invisible for a reason. Deleting or modifying one of them may cause unpredictable results. Unless you know the outcome of your modification, you should not make changes to an invisible file or folder.

Sherlock: Finding Invisible Files or Folders

Step 1

Open Sherlock.

Step 2

Click the Find File tab within the Sherlock window.

Step 3

Choose the volume(s) you wish to search from the Find Items pop-up menu.

Step 4

While holding down the Option key, click the leftmost Search Criteria pop-up menu. The pop-up menu contains four additional search criteria at the bottom of the menu. (See Figure 1.) Choose Visibility and release the Option key. (See Figure 2.)

Figure 1 Additional search criteria

Figure 2 Visibility search criteria

Step 5

Click Find .

Sherlock 2: Finding Invisible Files or Folders

Step 1

Open Sherlock 2.

Step 2

Click the Files channel. (See Figure 3).

Figure 3 Files channel

Step 3

Enable custom searching by clicking the Custom radio button and then clicking Edit (See Figure 4). The More Search Options window opens.

Figure 4 Custom search criteria

Step 4

Click the checkbox to enable the "is Invisible" option. (See Figure 5.)

Figure 5 Advanced options

Step 5

Click OK.

For more information on deleting invisible files and folders found by Sherlock and Sherlock 2, please see article 30726: "**Sherlock, Sherlock 2: Deleting Invisible Files and Folders**"

For information on how to find invisible files and folders with system software prior to Mac OS 8.5, please see article 16989: "**System 7.5-Mac OS 8.1: Additional Find File Search Options**"

Mac OS X Server: Macintosh Manager, Access To Applications Not Allowed

This article explains why when using Macintosh Manager users are able to open application programs not in their Workgroup approved items.
This article has been archived and is no longer updated by Apple.
There are several settings that can allow access to items not in a users Workgroup approved items. First, the Administrator has the option to allow applications to be opened by other applications (sub-launched), on a per application basis. This option is accessed by choosing Application Preferences from the Configuration menu. For the sake of tighter security, the default setting is to not allow applications to be sub-launched.

If an Administrator sets the option to allow sub-launching of an application, then that application can be opened from the Restricted Finder. Macintosh Manager does not see this situation as a security risk and allows it to happen.

To work around this, simply disable the "Allow this Application to be opened by other Applications" option for all applications that you do not want users to be able to access. The application will show up in Application Preferences once it has been added to any workgroup.

To enable helper applications for something such as a web browser without granting access to the helper application itself, enable the "Applications can open other applications, such as helper applications" option in the Security tab of the Computers tab. This setting does not apply to the shell application (Finder or Panels) so it will not override the approved application settings for the workgroup. Finder and Restricted Finder are environments where the Finder is shell application and the Panels environment has Panels as its shell application.

A user will also be able to launch non-approved items in the following situations:

- The application or an alias to the application is in the Apple menu and the workgroup has access to other items in the Apple menu. This is set in the Apple Menu section of the Privileges tab of the Workgroups tab.
- The application or an alias to the application is in the Control Panels folder and the workgroup has access to Control Panels. This setting is also in the Apple Menu section mentioned above.
- The application or an alias to the application is in the Startup or Shutdown Items folder and the workgroup can open items in this folder. This setting is in the Options tab of the Workgroups tab.
  Note: The checkbox is labeled Startup Items but pertains to both folders.
- The workgroup is set for "members can open any items on local volumes." If this is set any member of the workgroup can launch any application on a local volume. This setting is in the Items tab of the Workgroups tab. Local volumes do not include AppleShare, CD-ROM, or removable media (such as floppy or Zip) volumes.
- If access to all CD-ROMs in the Computers: Security Tab is allowed, all items on all CD-ROM disks are available to all users. The Removable Media setting in the Workgroup: Privileges Tab only affects removable media which can be accessed in the Finder such as Zip disks and floppy disks.
- The workgroup has an approved document created by a non-approved application. This can be done by dragging a document into the approved items list. Approving a document will automatically approve the creator application. Removing the document from the approved items list will also remove approval for the application, if the application and other documents are not approved.

Mac OS X Server: Macintosh Manager - Resetting Default Password

The default Macintosh Manager User password sent to Mac OS X Server when a Macintosh Manager user attempts to log in is reset by running the NetBoot Setup Assistant.
This article has been archived and is no longer updated by Apple.
It is routine that a Mac OS X Server administrator may use AppleFileServer Remote Administration to change user passwords. If the password for Macintosh Manager User is changed, though, a conundrum results. Although the password that Macintosh Manager Server expects from a system logging on as "Macintosh Manager User" has been changed successfully, there is no direct way in which the password that is automatically sent by these systems to the server can be changed to match. This password is embedded and implicit.

The matter can be resolved by the following actions:

1. Quit and restart MacintoshManagementServer
2. Reboot the server (which accomplishes the same thing)

This works, because each time MacintoshManagementServer is restarted (which also happens when the system is rebooted), a new password is formulated and applied to the Macintosh Manager User account.

AppleWorks 5: Equation Editor Symbol Font Error

When opening the Equation Editor, an alert box appears with an error message that says the Symbol font installed is not the correct one.

This article has been archived and is no longer updated by Apple.

Symptom

When opening the Equation Editor, an alert box appears with an error message that says the Symbol font installed is not the correct one.

Solution

1. Quit all open applications.
2. Drag the Symbol font from the Fonts folder to the Trash.
3. Use the AppleWorks installer to perform a custom installation of the Equation Editor (one of the Writing Tools).

This installs a version of the Symbol font that is compatible with AppleWorks.

Apple DVD Player: "Disc may be dirty or scratched" message

This article has been archived and is no longer updated by Apple.

The Apple DVD Player application displays an alert box with an error message about the disc being dirty or scratched. This document applies to Mac OS 9.2 or earlier.

Symptom

The Apple DVD Player application displays an alert box with the following error message:

> "Apple DVD Player has stopped because it's having problems playing the disc. The disc may be dirty or scratched, or the disc manufacturer may have encoded the disc incorrectly."

Solution

Upgrade to the latest version of the Apple DVD Player for your computer.

If you have a Macintosh with hardware-based DVD decoding, use Apple DVD Player 1.3, which is part of Mac OS 9. If your Macintosh has software decoding (if it came with Apple DVD Player 2.0 or later), check Apple Software Updates for the latest available version of Apple DVD Player.

If you have not upgraded to Mac OS 9, try these steps:

1. Eject the DVD-Video disc.
2. Press the Command, Option, and I keys while inserting the DVD-Video disc. This causes the computer to read the disc as an ISO 9660 formatted disc, rather than a UDF formatted disc. If the disc appears on the desktop, but has the DVD emblem on its icon, then it has not been accessed in the correct format. To access it correctly, control-click the icon and select "Mount as ISO 9660" from the contextual menu. The disc will become available with a generic icon.
3. Quit the Apple DVD Player application if necessary.
4. Open the Apple DVD Player application.
5. Play the movie. It should play, but you may still see the error message if the DVD-Video disc doesn't have an ISO 9660 volume.

Turn off AppleTalk by opening the AppleTalk control panel, choosing User Mode from the Edit menu, clicking Advanced, clicking Options, clicking Inactive, then OK.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, please see article 24604: "**PowerBook G3 & G3 Series: Identifying Different Models**"

For information on upgrading memory in a PowerBook G3 Series (Bronze keyboard) computer, see article 58325: "**PowerBook G3 (Bronze keyboard): Upgrading Memory**"

Warning: To avoid damage to your computer, Apple recommends that only an Apple-certified technician install additional RAM. Consult the service and support information that came with your Apple product for instructions on how to contact an Apple-authorized service provider or Apple for service. If you attempt to install additional RAM yourself, any damage you may cause to your equipment will not be covered by the limited warranty on your computer. See an Apple-authorized dealer or service provider for additional information about this or any other warranty question.

Getting Ready

Before you open your computer, make sure that you have a Phillips or a Torx T-8 screwdriver (available from a hardware or electronics supply store).

Removing the Keyboard and Internal Heat Sink

The design of your Macintosh PowerBook allows you to easily access the internal components of the computer by removing the keyboard. The steps in this section explain how to remove the PowerBook keyboard and internal heat sink to access the RAM expansion slot.

1. Place your PowerBook on a hard, flat surface.

2. If your PowerBook is turned on, press the Power button. In the Shut Down dialog box, click Shut Down.

> **Warning:** The internal components (including the internal heat sink) of your PowerBook may be hot. If you have been using your PowerBook, wait 10 minutes before continuing, to let the internal components cool down.

3. Unplug the power adapter and any other devices from the back of your PowerBook. Unplug any phone line from the internal modem.

4. Adjust your display so that it is at a 90-degree angle to the computer.

> If your display is tilted too far back, your PowerBook may tip backward when the expansion bay modules are removed in the next step.

5. Pull out both expansion bay release levers to eject the modules or batteries in both the expansion bays. See Figure 1.

Figure 1 Pulling the expansion bay release levers.

6. Remove the modules or batteries from both the expansion bays.

7. With your thumbs positioned slightly below the keyboard, place your fingers inside the expansion bays and locate the small plastic tabs that hold the keyboard in place. The plastic tabs have small ridges on them and are located on the underside of the top shell of the PowerBook approximately one inch inside each expansion bay. See Figure 2.

Figure 2 Plastic tabs inside the expansion bays.

8. Slide the plastic tabs toward you until you see the lower portion of the keyboard pop up.

9. Lift the lower portion of the PowerBook keyboard up slightly and pull it back enough to displace the five metal tabs that hold the front of the keyboard in place. See Figure 3.

Figure 3 Removing the keyboard.

10. Flip the keyboard over and lay it on the palm rests and trackpad. See Figure 4.

Figure 4 Flipping the keyboard over.

11. Remove the two screws that secure the internal heat sink (using a Phillips or Torx T-8 screwdriver) and then lift it up by pulling on the small metal tab. See Figure 5.

Warning: The PowerBook internal heat sink may be hot. If you have been using your PowerBook, wait 10 minutes before continuing to let the internal components cool down.

Figure 5 Internal heat sink with two screws and small metal tab.

You now have access to the internal components of your PowerBook.

Installing A RAM Expansion Card

To install a RAM expansion card in your PowerBook, follow these steps:

Important: Make sure that the RAM expansion card you are installing is made for your Macintosh PowerBook model. Components designed for other PowerBook models will not work with your computer.

1. Locate the empty RAM expansion slot. See Figure 6.

Note: If you ordered your PowerBook with additional memory, this slot may already have a RAM card installed.

Figure 6 RAM expansion slot.

2. Gently touch the metal surface on the right side of the inside of the computer to discharge any static electricity built up on your body. This prevents damage to your Macintosh PowerBook or RAM card. See Figure 7.

Figure 7 Safely discharging static electricity.

Don't walk around while installing the card. If you do, touch the metal surface again to discharge any static electricity.

3. Position the RAM expansion card at a 30-degree angle. Line up the notch in the PowerBook RAM expansion card with the small

tab in the RAM expansion slot. See Figure 8.

Figure 8 Positioning the RAM card.

4. Push the RAM expansion card into the plastic expansion slot. You may feel some resistance. If you are having trouble inserting the card, try pushing one side at a time.

Gently push the RAM expansion card down until the two snaps on either side of the card lock into place. See Figure 9.

Figure 9 Locking the RAM card into place.

Your RAM expansion card is now ready to use.

Replacing the Keyboard and Internal Heat Sink

Follow the steps in this section to replace your PowerBook keyboard.

1. Insert the internal heat sink and replace the two screws to secure it in place. See Figure 10.

Figure 10 Heat sink and screws.

2. Press down on the bottom portion of the heat sink to secure it into place.

3. Flip the keyboard back on top of the opening in your PowerBook.

4. Insert the five small tabs at the top of the keyboard into the opening in the PowerBook case. See Figure 11.

Figure 11 Aligning the keyboard tabs.

5. Press down on the lower portion of the keyboard until it snaps into place.

6. Replace the expansion bay modules.

You are now ready to start working with your PowerBook again.

Warning: Never turn on your PowerBook G3 Series computer unless all of its internal and external parts are in place. Operating the computer when it is open or missing parts can be dangerous, and can damage your computer.

Mac OS: "International Utilities Not Present" Error During Startup

This article discusses the "International Utilities Not Present" message that can appear during startup when the computer was not shut down properly.
This article has been archived and is no longer updated by Apple.

Issue

If your computer was not shut down properly the next time the computer starts up Disk First Aid checks the system and hard drive. During the Startup Disk First Aid check, the following error can appeared: "Sorry, a system error occurred. International Utilities not present. To turn off extensions, restart and hold down the Shift key."

When restarting with extensions disabled, the computer starts correctly and Disk First Aid can be run. However, upon the next restart, the same error appeared.

Solution

1) Solution

- Start up with extensions disabled
- Disable the "Warn me if computer was shut down improperly" option in the General Controls control panel
- Run Disk First Aid manually to ensure that the hard disk is in good condition.
- Enable the warning option in General Controls control panel
- Restart the computer

2) Solution

The Shutdown Check file may be corrupt. To replace the Shutdown Check file, follow these steps:

- Make a Stickies note called "Shutdown Check" and save to the hard disk.
- Click "OK" in the dialog box to replace the existing Shutdown Check file.
- Open the Macintosh hard disk.
- Delete the Stickie note named "Shutdown Check"
- Restart the computer

QuickTime 4: Adobe Premiere DV Plug-in Compatibility Issue

After updating to QuickTime 4, I am experiencing difficulties using Adobe Premiere 5.0.1 or earlier with the DV plug-ins that came with my Power Macintosh G3 (Blue and White). Are the plug-ins compatible with QuickTime 4?
This article has been archived and is no longer updated by Apple.
The DV plug-ins that Apple ships with the Apple FireWire PCI card and the Power Macintosh G3 (Blue and White) are not supported with QuickTime 4. Users of Adobe Premiere running QuickTime 4 should contact Adobe for information on a version of Premiere with native DV support.

Mac OS: File, Folder And Volume Name Limitations

This article describes the limitations of file, folder and volume names in the Mac OS.
This article has been archived and is no longer updated by Apple.
For all Mac OS versions up to and including Mac OS 9.x:

File and Folder names are limited to 31 characters.

Volume names are limited to 27 characters.

Names cannot include the colon (:) character. This character is reserved by Mac OS to denote catalog hierarchy. A colon typed in a character name will be replaced by a dash (-) automatically by Mac OS.

Note: There are a few known instances where a volume name can be over 27 characters, but in order for the volume name to work correctly with file sharing and all Mac OS versions, file names should not exceed 27 characters.

AppleWorks 5: "View Document in Browser" Opens Wrong Browser

This article explains how to view an AppleWorks 5 document in a browser.
This article has been archived and is no longer updated by Apple.

Viewing HTML documents

With AppleWorks 5, you can view HTML documents in a browser by following these steps:

1. Click the down arrow on the Button Bar and select Internet.
2. In the Internet Button bar, there is a button to use the default browser to view your document (see Figure 1). This button sends an 'Open file' command to Internet Config, not an HTTP request.

Figure 1: The AppleWorks 5 "Launch Browser" button.

Changing browsers

To change the setting for which browser you want to use to view AppleWorks HTML files, follow these steps:

1. Open the Internet control panel, which is in the Apple menu.
2. If the Internet control panel does not display an 'Advanced' tab in its window, choose User Mode from the Edit menu, set the User Mode to Advanced, and click OK.
3. Click on the Advanced tab, then click the Helper Apps icon.
4. Select the item for 'open file' from the list on the right. You can change the settings by clicking the Change... button.

You can now set the Helper Application for 'open file' to your browser of choice.

AppleShare IP 6.2: Setting Up Home Directory Folders

I am setting up an AppleShare IP 6.2, and I am interested in taking advantage of the new Home Directory feature. How do I set this up, and how does it work?

This article has been archived and is no longer updated by Apple.
The following is an excerpt from the ASIP 6.2 Tutorial found in the Tutorials folder on the AppleShare IP 6.2 CD:

"The AppleShare IP 6 administrator can create home directory folders which can contain user folders for each user. After the administrator creates the home folder and sets access privileges, a folder for a user is automatically created when the user logs in for the first time to the AppleShare file server. When the name of the user is displayed in the volume list in the Chooser, the user can log on to his own folder to save and store information. Each home directory folder can be viewed and accessed only by its owner. This automatic feature will save Administrators time in setting up individual sharepoints for each new User."

As an example, Figure 1 shows an administrator creating a share point that will contain users' home directory folders the next time each user connects to the server.

Figure 1 Privileges window.

Notes:

1. if a user has already logged on to the server prior to the creation of the home directory folder, the folder will not be created until the user's next login.

2. Privileges for the initial Home Directory folder need to be set as Read only for the User/Group section. For additional information see article 31294: "**AppleShare IP 6.2/6.3: Saving to the Home Directory Share Point**" .

When a home directory user now connects to the server, the user is presented with the option of mounting his or her home directory. For example, let's say that the user named "Average User" has logged onto the server. In the following picture of Disks and Share Points (see Figure 2), we see that a folder named "Average User" has now been created.

Figure 2 Disks & Share Points window.

If we examine the privileges for Average User's home directory (see Figure 3), we find that Average User is the owner of the folder and has Read/Write privileges, although the administrator retains ownership of the enclosing folder:

Figure 3 Home Directory's privileges.

Power Macintosh G4 (PCI Graphics): 10.2GB Hard Drive Issue

Western Digital Corporation announced that they are implementing a limited recall of certain Caviar hard drives to address possible long-term reliability issues. This article explains the issue, how to determine if your Power Macintosh G4 (PCI Graphics) is affected, and what steps to take if it is.
This article has been archived and is no longer updated by Apple.
Western Digital Corporation is implementing a limited recall of certain capacities of their Caviar hard drives. Only a small number of the Power Macintosh G4 (PCI Graphics) built with the Western Digital 10.2 GB hard drive are affected. By looking at the serial number of the computer, you can determine if your system may be affected.

Here are the steps to follow to identify whether your Power Macintosh G4 (PCI Graphics) has an affected Western Digital hard drive:

Step One
Verify the computer serial number is xx938xxxxxx or xx939xxxxxx, where the x can be any letter or number. The serial number is located on the rear of the Power Macintosh G4, just below the AC receptacle.

If the serial number matches the above format, then go on to step two. If the serial number does not match, then your hard drive is not affected by this issue.

Step Two
Use Apple System Profiler to verify the model number and serial number of the Western Digital drive installed.

1. Open Apple System Profiler.
2. Select the Devices and Volumes tab.
3. In the Devices and Volumes window, click on the Hard Drive triangle that is to the right of the Internal ATA 1 line.

A small box will open containing the information regarding the installed hard drive. The information will look similar to this:

Hard drive

```
Driver version:      3.2.2f1
Mac OS partitions:   1
Removable media:     No
Vendor:              WDC
Revision number:     83.10A83
Product ID:          WD102AA
Serial number:       WD-WM6570248884
Unformatted size:    9.55 GB
```

The relevant information is the Product ID and Serial Number.

Product ID
If the Product ID is WD102AA, then look at the Serial Number. Otherwise, the drive is not affected by this issue and does not fit the recall parameters set forth by Western Digital.

Serial Number
If the Serial Number is in the range WD-WM6570248884 to WD-WM6570432919, inclusive, the drive is affected by the issue and should be replaced. Please contact your local Apple Authorized Service Provider to have the drive replaced.

If the Serial Number is not in the above range, the drive is not affected by this issue and does not fit the recall parameters set forth by Western Digital.

Note: Apple strongly recommends that you back up your hard drive before having your computer serviced. Apple is unable to retrieve data left on the hard drive once it has been replaced.

PowerBook (Bronze Keyboard, FireWire and G4): Consequences of Serial Device on S-Video Port

When a serial device is connected to a PowerBook G3 (Bronze Keyboard and FireWire) or PowerBook G4, the computer may not startup properly.
This article has been archived and is no longer updated by Apple.

Symptom

If a serial or LocalTalk device is connected to the S-Video port on the PowerBook G3 Series (Bronze Keyboard and FireWire) or PowerBook G4, the computer will not startup properly. The Mac OS splash screen and extensions along the bottom of the screen do not appear during startup. When the desktop loads, there is no menu bar however some icons may appear on the desktop area.

Affected Products

- PowerBook G3 Series (Bronze Keyboard)
- PowerBook G3 Series (FireWire)
- PowerBook G4

Solution

Do not connect serial or LocalTalk devices, such as printers, hand-held to the S-Video port on the PowerBook G3 Series (Bronze Keyboard and FireWire)or PowerBook G4 computers.

When a serial device is connected to the S-Video port, the computer believes an external display is attached. Under normal circumstances when an external display is connected to the S-Video connector, the built-in display becomes a secondary display and the external display becomes the primary screen. This is why the menu bar, welcome screen, and extensions do not appear on the built-in display.

If the computer is put into the sleep mode and the serial device is removed from the S-Video port, then taken out of the sleep mode, the computer will return to its normal display mode.

Mac OS X Server: Determining Which Version Is Installed

This article explains how to check which version of Mac OS X Server is installed on a computer.
This article has been archived and is no longer updated by Apple.
There are several ways to determine which version of Mac OS X Server is installed, or whether a specific patch has been applied successfully.

About this Mac

If you are running Mac OS X Server 10.x, select 'About this Mac' from the Apple Menu to find out the version.

Console Window
A direct way of verifying the version of Mac OS X Server is to open the Console from the Tools Menu within Workspace Manager. Besides displaying system messages related to the opening of applications and the initialization of various services, the Console writes the currently installed Mac OS X Server version at login.

Listed below are the readouts in the Console screen with each version of the OS:

- Mac OS X Server 1.0 (Initial release): "Software Version Mac OS X Server (Hera1O9)"
- Mac OS X Server 1.0.1: The output is identical to that found in the 1.0 release.
- Mac OS X Server 1.0-2 (update posted 1999-07-22): "Software Version Mac OS X Server+Mac OS X Server 1.0-2 Patch (Hera1O9+Loki2G1)"
- Mac OS X Server 1.2: Software Version Mac OS X Server 1.2 (Pele1Q10)
- Mac OS X Server 10.x: "Mac OS X Console"
  Note: This does not indicate which version of Mac OS X Server10.x is installed.

Installer Receipts
Alternatively, locate the package used to install the patch (in /Local/Library/Receipts/), double-click it to open the Installer.app, and examine the status in the window that opens. You may also verify the installation of each component of the patch directly after running the Installer by looking at the log file that is created in the process.

uname command
A third method is to open a terminal window and type the uname command. This command takes a variety of arguments, but if the -a argument is used, the command outputs all available information to the terminal screen, including hardware name, node name, operating system name, operating system release and operating system version.

For example, here is the printout received from issuing uname -a on the current version 1.2:

```
Rhapsody sfk 5.6 Kernel Release 5.6: Tue Nov 23 15:07:38 PST 1999;
root(rcbuilder):Objects/kernel-187.obj~2/RELEASE_PPC Copyright (c)
1988-1995,1997-1999 Apple Computer, Inc. All Rights Reserved.  Power
Macintosh
```

The Kernel Release will vary depending on the version of Mac OS X Server that is installed as the following chart shows.

Mac OS X Server version	Kernel Release version
1.0	5.3
1.0-1	5.4
1.0-2	5.5
1.2	5.6

Mac OS X Server 10.x returns "Darwin" with no version information. Therefore, this is not a way to determine which version of Mac OS X Server 10.x is installed.

For further details on the uname command, please refer to the online manual page.

Note: To find the most recent version of this software, please visit Apple Software Downloads at
http://www.info.apple.com/support/downloads.html

Published Date: Feb 17, 2012

Mac OS: Controlling Window Scrolling, Menu Pulldown

This article describes how to slow the scrolling of menus and windows.
This article has been archived and is no longer updated by Apple.
When scrolling through a menu that is longer than your display, there is a small triangle at the bottom of the menu (see Figure 1). When scrolling up, the triangle is at the top of the menu.

Positioning the pointer on the same line as the arrow will slow the scroll speed. Going below (or above if scrolling up) the arrow will invoke the normal scroll speed.

Figure 1: Small triangle at the bottom of a long menu.

When scrolling documents, you can click once in the gray area above or below the scroll box to move up or down a screen. You can also move the scroll box up and down directly by dragging it up or down. See Figure 2.

Figure 2: Scroll box in a scrollbar.

Some programs may also have keyboard shortcuts for moving up or down a page.

Published Date: Feb 17, 2012

AppleWorks 5: Select Dictionary Window Appears

I have created a document in AppleWorks 5. When I try to use the Check Document Spelling feature, a dialog box appears asking me to select my dictionary and type. Can you explain?
This article has been archived and is no longer updated by Apple.
Note: This discussion applies to both AppleWorks 5 and its predecessor, ClarisWorks.

The default dictionary is stored in the Claris folder inside your System Folder. If the dictionary has been moved or deleted, AppleWorks 5 opens the dialog shown in Figure 1.

Figure 1: Dictionary Dialog.

When this situation occurs, often it is because a clean install of system software was performed. Reinstall AppleWorks to restore all the necessary components of AppleWorks 5 to your System Folder. If you have a computer that shipped with AppleWorks 5 already installed, you can start up the computer from the Software Restore CD and perform a Restore in Place to install all the AppleWorks components.

Important: If you use Apple Software Restore to perform a Restore in Place, some of your System and Internet preferences will be reset to factory settings. Before using Apple Software Restore, please read the following Knowledge Base article:

Article 31063: "**Apple Software Restore: Some Preferences May Be Lost**"

For more information about performing a clean install of system software, see the following Knowledge Base article:

Article 30691: "**Mac OS: When & Why To Perform A Clean Install**"
Published Date: Feb 20, 2012

Macintosh: No Internet After Installing KeySpan USB to Serial Adapter

My internal modem no longer functions after installing the Keyspan USB Serial Adapter. Can you help?
This article has been archived and is no longer updated by Apple.
Note: This issue applies to any Macintosh equipped with USB and an internal modem, including the iMac, Power Macintosh G3 (all varieties), Power Macintosh G4, PowerBook G3 Series, and iBook.

The Keyspan USB Serial Adapter software registers additional ports with Mac OS. The Modem control panel preferences are not properly updated to reflect the additional serial ports so the wrong port can end up being selected.

To resolve this issue, simply edit the currently active Modem control panel configuration with the correct settings for your internal modem. To do this:

1. Open the Modem control panel.
2. Select Internal Modem from the Connect Via pop-up menu.
3. Close the Modem control panel to save your changes.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

AppleShare IP 6.2: Creating New Mail Database Without Losing Messages

This article explains how to create a new AppleShare IP 6.2 mail database without losing any existing email.

This article has been archived and is no longer updated by Apple.
You may export the messages from the old mail database and then reimport them into a new mail database by following these steps:

1. Stop the mail server and quit AppleShare IP Mail Admin.
2. Make a backup of your AppleShare IP mail database.
3. Open AppleShare IP Mail Tool and export the messages for every account that currently has email messages stored on the mail server. The mailboxes will export to the BSD-standard mailbox format. If you suspect corruption and are familiar with this format, you may edit these with a text editor.
4. Move the existing mail database out of the AppleShare IP Mail Folder (for example, to the desktop).
5. Start the mail server. This will create a new mail database in the AppleShare IP Mail Folder, but user mailboxes will not yet exist.
6. Send a test message to all accounts that were exported. This will create the user mailboxes.
7. Stop the mail server and quit AppleShare IP Mail Admin
8. Launch AppleShare IP Mail Tool and import the mailbox for every account that was exported.
9. Quit AppleShare IP Mail Tool and start the mail server.

For additional information on exporting and importing users, see the following article:

Article 24692: "**AppleShare IP 6.x: Importing/Exporting Users & Groups FAQ**"
Published Date: Feb 20, 2012

PowerBook, iBook: Voice Mail/Speakerphone Compatibility

Can I use the PowerBook G3 Series, PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire), or iBook as a speakerphone and voice mail system?
This article has been archived and is no longer updated by Apple.
The modems in PowerBook G3 Series, PowerBook G3 Series (Bronze keyboard), and iBook computers do not support voice and cannot function as a speakerphone. The modem may work with some third-party voice mail applications, but Apple does not support the use of these applications.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, please see the following Knowledge Base article:

Article 24604: "**PowerBook G3 & G3 Series: Identifying Different Models**"
Published Date: Feb 20, 2012

Mac OS: Avoid Using Duplicate Computer Names With Apple Network Management Products

If you allow client computers on your network to have the same computer name (as defined in the File Sharing panel), you may encounter unexpected behavior and privileges issues with these Apple network management products: Apple Network Assistant, Apple Remote Desktop, and Macintosh Manager.

This article has been archived and is no longer updated by Apple.

Symptom

- You see alert messages in Macintosh Manager, but their origin is unclear or unknown.
- Privileges are not enforced as expected.
- Network Assistant indicates that you have added a computer that you know you have not added.
- Apple Remote Desktop displays incorrect information and "unavailable" workstations.

Solution

One or more client computers may have the same name, as defined in the Computer Name field. This is located in the Sharing pane of System Preferences for Mac OS X, and in the File Sharing control panel for earlier Mac OS versions. This name is used for AppleTalk and SLP applications, such as Chooser, Connect to Server, and Network Browser.

When File Sharing is turned off at the computers with duplicate names, they affect Macintosh Manager, Network Assistant, and Apple Remote Desktop, but otherwise appear to work normally. If File Sharing is enabled on pre-Mac OS X systems, an alert message indicates that the name is already in use on the network.

To resolve or prevent the issue, be sure that each computer has a unique computer name.

Published Date: Feb 20, 2012

AppleWorks 5: Creating and Printing Labels

AppleWorks 5 can be used to create and print out labels.
This article has been archived and is no longer updated by Apple.
In order to create labels in AppleWorks 5, you must create and use an AppleWorks database document. Here are the steps:

Step One
Open the AppleWorks 5 application program by double-clicking the AppleWorks icon inside your AppleWorks 5 folder on your hard drive. You will then be presented with a window named New Document. This window allows you to choose the kind of new document AppleWorks will create.

Step Two
Select the Database option with your mouse and then click OK. This will bring up a window titled Define Database Fields. The Define Database Fields window allows you to choose how many different fields there will be for your database, what kinds of fields they will be, and what their names will be.

Step Three
The first field in the label created for this demonstration is the Name field. Type `Name` and then click Create. This will add the Name field to the list up above. Using this same method, enter in the other field names. Simply name the fields for Address, City, State and Zip Code and click Create after naming each one. You will then see the names of all the fields you have created in the list above. See Figure 1.

Figure 1: Define Database Fields window.

Step Four
Click Done after you have defined all the fields you need for your label. This will create a new database document with one blank record containing the fields you have defined. See Figure 2.

Figure 2: The First Record.

Step Five
Fill in the fields of this first record by selecting the individual fields with your mouse and entering text into each one. In order to create a new record, choose New Record from the Edit menu. Repeat the actions in Step Five until you have created a record in your database for each of the labels you want to create. See Figure 3.

Figure 3: The completed list.

Step Six
Choose AppleWorks Assistants... from the Help menu. You will then see a window titled Select Assistant. For a database document, the only available AppleWorks Assistant is the Create Labels Assistant. Select it from the list and click OK. This will start the Create Labels Assistant. This Assistant will walk you through setting up a layout for printing your labels.

For information on AppleWorks 6 labels, please see article 25264: "**AppleWorks 6: Creating Labels**"

Published Date: Feb 20, 2012

Mac OS: Do Not Remove Multiprocessing Folder

I notice that there is a folder called Multiprocessing in my Extensions folder. Since I do not have multiple processors in my Macintosh, can I safely remove this folder?

This article has been archived and is no longer updated by Apple.

The files in this folder do not occupy any significant RAM or hard disk space, so you will not benefit by removing it. Although your Macintosh may have a single processor, we strongly discourage removing the Multiprocessing folder. Applications which are multiprocessor-aware rely on the software in this folder and may crash if it is not present. Also, some recent Macintosh models may not wake from sleep if this folder is removed.

Mac OS 9.x: Incorrect Version for CD Update 2.0

I just installed Mac OS 9.x, and I went to install the iMac CD update 2.0. I get a message that states I have the incorrect system version and it works best on system 7.x or greater. It also states that I should proceed at my own risk. Don't I have the latest version of Mac OS?
This article has been archived and is no longer updated by Apple.
Note: This issue also applies to the Power Macintosh G3 CD Update 2.0.

The CD update incorrectly identifies Mac OS 9.x, and gives the alert shown in Figure 1.

Figure 1: Alert dialog.

The CD-ROM firmware updaters were created before Mac OS 9.x existed. The installers are unaware of the Mac OS 9.x environment and the message should be interpreted with this in mind. The firmware update should be applied, regardless of the Mac OS level. It is fine to continue.

Before running the CD update, refer to the following articles for more information on when and how to install the CD update 2.0.

Article 24714: "**Power Macintosh G3 CD Update 2.0: Read Me**"
Article 60458: "**iMac CD Update 2.0: Read Me**"

AppleWorks 5: ‘The file "QuickHelp" couldn‘t be found‘ Error

When I try to use help in AppleWorks 5, I get this error: 'The file "QuickHelp" couldn't be found'. What is causing this message?
This article has been archived and is no longer updated by Apple.
ClarisWorks 5 used the QuickHelp engine for the Frequently Asked Questions component of help. ClarisWorks has been renamed to AppleWorks 5, and it continues to use QuickHelp.

The QuickHelp file is stored in the Claris folder inside your System Folder. If QuickHelp has been moved or deleted, AppleWorks will display the error dialog mentioned above. The most common cause of this behavior is that a clean install of system software was performed (in other words, system software was reinstalled and a new System Folder created).

Reinstall AppleWorks to restore all the necessary components. If you have a computer that shipped with AppleWorks already installed, you can start up the computer from the Software Restore CD, and perform a Restore in Place to install all the AppleWorks components.

Important: If you use Apple Software Restore to perform a Restore in Place, some of your System and Internet preferences will be reset to factory settings. Please read the following article before using Apple Software Restore:

Article 31063: "**Apple Software Restore: Some Preferences May Be Lost**"

For more information about performing a clean install of system software, see the following article:

Article 30691: "**Mac OS: When and Why To Perform A Clean Installation**"
Published Date: Feb 20, 2012

AppleWorks 5: ‘MacLink Import Translators‘ File Appears On Hard Drive

Whenever I run AppleWorks 5, two files appear on my hard drive:

- MacLink Import Export Translator
- MacLink Export Translators

Can you explain?
This article has been archived and is no longer updated by Apple.
This may occur on computers with Dataviz MacLink Plus installed, if the Claris folder is missing from your System Folder. The most common cause of this behavior is that a clean install of system software was performed (in other words, system software was reinstalled and a new System Folder created). Reinstall AppleWorks 5 to restore all the necessary components. If you have a computer that shipped with AppleWorks 5 already installed, you can start up the computer from the Software Restore CD, and perform a Restore in Place to install all the AppleWorks 5 components.

Important: If you use Apple Software Restore to perform a Restore in Place, some of your System and Internet preferences will be reset to factory settings. Before using Apple Software Restore, please read the following Knowledge Base article:

Article 31063: "**Apple Software Restore: Some Preferences May Be Lost**"

For more information about performing a clean install of system software, see the following Knowledge Base article:

Article 30691: "**Mac OS: When & Why To Perform A Clean Install**"

USB Mouse: Intermittently Loses Tracking In One Axis

My USB mouse will intermittently lose tracking in either the horizontal or vertical axis. Can you help?
This article has been archived and is no longer updated by Apple.
If your USB mouse occasionally loses its ability to track in one direction then it is possible that it is caused by one of the following:

The mouse may need to be cleaned. The USB mouse contains a ball that must remain clean in order for it to roll properly. In addition, there are several rollers inside your mouse which can accumulate debris. If either the ball or the rollers are dirty the USB mouse may not track properly. See the following article for instructions on cleaning a mouse:

Article 6491: "**How To Clean A Mouse**"

The mouse is broken. If cleaning the mouse does not resolve the situation then it is possible that the mouse is broken. If you find that unplugging and then re-plugging the mouse into the USB port restores functionality of the mouse then it is possible that the mouse is broken and may need to be replaced. Contact Apple for assistance in getting your USB mouse replaced.

iMac (Slot Loading): Computer Stops Responding at Startup with Multiple USB Devices

In some cases, the iMac (Slot Loading) does not respond when starting up. This typically occurs when two USB peripherals are connected and turned on. The USB drivers may not be installed, or may be installed but disabled through the Extensions Manager. The symptom does not occur if one of the peripherals is disconnected.
This article has been archived and is no longer updated by Apple.
This intermittent issue has been verified with the Epson Stylus printer and an Iomega Zip drive or Imation SuperDisk drive, though it can occur with other USB peripherals in combination with the Epson Stylus printer.

The issue is related to the USB software in Mac OS 8.6 and has been resolved in Mac OS 9.

As a workaround, you may disconnect the peripheral that is not in immediate need. Since a USB device can be plugged in while the computer is running, disconnect one of the peripherals during system startup and reconnect it after the computer has successfully started.

Although this specific issue is not related to the driver version for the USB device, always make sure you are using the most current drivers.

Mac OS: Menu Differences Between Simple Finder and Regular Finder

What are the differences between the menus in Simple Finder and regular Finder?
This article has been archived and is no longer updated by Apple.
Starting with Mac OS 8.0, Apple has offered a Finder Preference item called Simple Finder. When this option is selected, the menu item choices are reduced to a minimal, simplified set of choices that still enable most basic operations.

This reduction in menu commands can be best shown with the following screen shots. Note that the menus shown here are for Mac OS 9 and will be slightly different from Mac OS 8. Figure 1 shows the standard Finder menus.

Figure 1: Standard Finder menus.

Figure 2 shows the menus available when the Simple Finder option is selected.

Figure 2 Simple Finder menus.

Menu Items Not Available in Simple Finder

Here is a summary listing of the menu items not available in Simple Finder:

File Menu

- Print
- Move To Trash
- Get Info
- Label
- Make Alias
- Add To Favorites
- Put Away
- Encrypt (Mac OS 9)
- Show Original
- Page Setup
- Print Window

Edit Menu

- Undo
- Clear
- Select All
- Show Clipboard

View Menu

- as Window
- as Pop-up Window
- Clean Up
- Arrange
- Reset Column Positions
- View Options

Special Menu

- Erase Disk
- Sleep
- Restart

Note that no command key equivalents are supported using Simple Finder. For example, Command-N does not create a new folder; you must select the New Folder menu item for this action.

Also note that since Pop-up Window is removed from the View menu, Pop-up Windows are not available in Simple Finder. If you have Pop-up windows established and you turn on the Simple Finder preference, all Pop-up windows are redrawn as normal windows on the desktop. Turning off Simple Finder does not restore them to being Pop-up windows, because the window state has been changed to normal.

Simple Finder can be enabled or disabled by choosing Preferences from the Edit menu and clicking to place or remove the check mark next to Simple Finder.

iBook: Adapters Needed When Traveling

I will be traveling and will be taking my iBook computer with me. Which adapters do I need for the power and modem?
This article has been archived and is no longer updated by Apple.
iBook computers can use 110 V and 220 V power. If the power in the country you are traveling to is different from your home country's, you need a power cord adapter. You can purchase one at an electronics or travel retailer. Review the following Knowledge Base article for more details:

Article 129: "**World Power Differences Can Limit International Product Use.**"

Most modems are not certified for use in other countries. It is best to use an external USB modem that complies with the regulations of the country you are travelling to.

AppleShare IP 6.3: Creating User Folders Automatically

This article explains how to automatically create user folders using AppleShare IP 6.3 (ASIP).

This article has been archived and is no longer updated by Apple.

Objective

Create home directories that automatically set up a user folder for each registered user. The folder has the user's login name and is set up when they log on to the file server for the first time through AppleShare or Windows file sharing. The folder's Owner and Everyone privileges are inherited from the enclosing share point, and the User/Group privileges are set to the user's account with Read & Write access.

After the folder is created, the user can access it in the Chooser, over FTP, and over Windows file sharing services.

Note: Privileges for the initial Home Directory folder need to be set as Read only for the User/Group section. For additional information see article 31294: "**AppleShare IP 6.2/6.3: Saving to the Home Directory Share Point**" .

Affected Products

- AppleShare IP 6.3

Solution

There are two sets of directions listed below. If the home directory is already a sharepoint, use the first set of steps. If the home directory is not already a sharepoint, use the second set of steps.

Setting up a home directory using a folder that's already a sharepoint

To set up a home directory folder that's already a sharepoint:

1. Open Mac OS Server Admin and log on to the server you want to administer
2. Click Privileges
3. Choose Show Disks & Shared Items
4. Select the folder you want to be the home directory folder
5. Click Privileges
The Access Privileges window opens.
6. Select "Automatically create user folders inside this shared item"
7. Click Users and Groups button
8. Select "Show Users & Groups List"
9. Drag a user or group from the list to the User/Group box in the Access Privileges window
See Note about Groups and Access Privileges section
10. Choose Read only from the User/Group pop-up menu. For additional information see article 31294: "**AppleShare IP 6.2/6.3: Saving to the Home Directory Share Point**" .
11. Close the Access Privileges window

Setting up a home directory using a folder that's not yet a share point

1. Open Mac OS Server Admin and log on to the server you want to administer
2. Click Privileges
3. Select "Set Privileges"
4. Select the folder you want to be the home directory folder
5. Click Choose

The Access Privileges window opens

6. Select "Share this item and its contents"

7. Select "Automatically create user folders inside this shared item"

8. Click Users and Groups

9. Select "Show Users & Groups List"

10. Drag a user or group from the list to the User/Group box in the Access Privileges window
See Note about Groups and Access Privileges section

11. Choose Read only from the User/Group pop-up menu. For additional information see article 31294: "**AppleShare IP 6.2/6.3: Saving to the Home Directory Share Point**" .

12. Close the Access Privileges window

Note about Groups and Access Privileges

When any member of a group logs in for the first time, selects and mounts this sharepoint, a directory is created for the member. While giving "everyone" read-write access accommodates guest users, this does not specify any ownership. Only members of a group defined to have access to the home directory folder will have home directories made automatically. Guests will not have home directories made for them.

Macintosh Manager, Mac OS 8.1: "Unable to Start the Requested Environment" Message

Use this solution for an issue, sometimes called "looping login," in which Macintosh Manager returns you to the login screen after displaying an alert message.
This article has been archived and is no longer updated by Apple.

Symptom

After logging in to Macintosh Manager, an alert box with this message appears:

> "Unable to start the requested environment because of an unknown problem."

You are logged out and returned to the login screen.

Products affected

- Macintosh Manager (all versions)
- Mac OS 8.1 and earlier

Note: Mac OS versions prior to 8.1 are not supported by Macintosh Manager 2.0 or later.

Solution

There are several possible solutions:

- Upgrade to Mac OS 8.5 or later. Mac OS 8.6 or later is recommended.
- Use the Extensions Manager to disable Macintosh Easy Open.

If the issue persists, refer to article 58820: "**Macintosh Manager: Client Login Troubleshooting**".

Macintosh Manager: Wrong Icons in Panels Environment

In the Panels environment, application icons appear as a large, pink letter "M".
This article has been archived and is no longer updated by Apple.

Symptom

In the Panels environment, application icons appear as a large, pink letter "M".

Solution

Clear the custom icon from the font.

1. Drag the font out of the Fonts Folder to the desktop.
2. Select the font and choose Get Info from the File menu.
3. Select the icon in the Get Info window.
4. Choose Clear from the Edit menu. The custom icon should disappear and the font should appear as a suitcase.
5. Drag the font back to the Fonts folder.
6. Repeat this procedure for all fonts with custom icons.

USB: Duplicate Device Appears in Apple System Profiler

This article explains a situation where a duplicate USB modem appears in the Apple System Profiler Devices and Volumes tab. When connecting the USB modem after starting up the computer, only one appears.
This article has been archived and is no longer updated by Apple.
This issue was fixed in Mac OS 9, as well as in the Mac OS software that shipped with the iBook, iMac (Slot Loading), and Power Mac G4 computers.

Updating older computers to Mac OS 9 will resolve the issue. Alternatively, connect the modem to the Macintosh after starting up the computer.

AppleShare IP 6: Too Many Aliases in a Folder Hangs Server During ftp Access

This article describes a condition that may cause AppleShare IP to hang when some ftp clients access the server.

This article has been archived and is no longer updated by Apple.
An AppleShare IP 6 server may hang if an ftp client issues a LIST command for a folder that contains 17 or more aliases to items on a volume that is not the startup volume (some ftp clients use the LIST command when reading the contents of a directory).

Solution

Do not put more than 16 aliases to items not on the startup volume into the same folder if the folder is accessible through ftp.

Macintosh Management Server: Error -5047

None of my clients can connect to my Macintosh Management server. I keep getting an error: "Searching for the Macintosh Manager Server (Unknown problem #-5047)." What is causing this?
This article has been archived and is no longer updated by Apple.
This is the error you will see on your client computers if you have selected "Restrict users to single active logon per account" on the AppleShare IP server. Launching the Macintosh Manager Admin program shows a similar error: "Unable to open databases on "MM Server" because of an error: An unknown error has occurred (-5047)."

The first computer to log on either as a client or using the administrator program will work normally, but all subsequent attempts to access the Macintosh Manager server will give one of the errors mentioned above.

As noted in the Read Me for Macintosh Manager Server, this option must be disabled on any AppleShare IP server being used as a Macintosh Manager server.

Mac OS X Server: How to Upgrade a NetBoot Image to Mac OS 9

This article explains how to upgrade a NetBoot image to Mac OS 9.
This article has been archived and is no longer updated by Apple.

System Requirements

Upgrading a NetBoot image to Mac OS 9 requires:

- Mac OS X Server 1.0-2 (or Mac OS X Server 1.2)
- Mac OS 9 CD
- NetBoot Desktop Admin 1.1 recommended

Note: If you are using Macintosh Management Server, upgrade to version 1.2 or later of this software, available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Introduction

Early versions of Mac OS X Server came with Mac OS 8 NetBoot images. It is possible to upgrade these images to Mac OS 9.

Note: If you wish to NetBoot an iBook, iMac (Slot-loading), or Power Mac G4 computer, you must upgrade your NetBoot image to Mac OS 9 or later.

Summary of Upgrading the NetBoot HD Disk Image to Mac OS 9

To upgrade the NetBoot HD disk images to Mac OS 9, you have to log on to a NetBoot client computer, connect to the NetBoot server volume, and open the NetBoot Desktop Admin program several times. You must also have a Mac OS 9 installation CD to upgrade the image. Changes are not available to you or other users until after the NetBoot client computer restarts the last time.

Before You Start

Before you start, you need the following information:

- Name and password for a Global Administrator who belongs to the System Access workgroup.
- Name and password of the root user.
- Make sure that no users are NetBooting during the upgrade procedure.

Performing The Upgrade

To upgrade the NetBoot HD disk image to Mac OS 9:

1. Log on to a NetBoot client computer as a Global Administrator who belongs to the System Access workgroup.
2. Mount the NetBoot Server volume. Open the NetBoot Desktop Admin application.
3. Using NBDA, increase NetBoot HD.img image so that there is at least 250 MB of free space. You cannot reduce the size of an image without reverting to a backup copy.
4. Click Make Private Copy. NetBoot Desktop Admin creates copies of the disk images that you can change. This may take several minutes and you should not interrupt the process. When it finishes, your NetBoot client computer restarts automatically.
    - **Important:** Because the copies of the disk images are associated with the NetBoot client computer you used to create them, you must make the changes to the images using the same computer. If you change computers, you will not be able to see the changes you have made and your changes will not be available to users. In addition, you increase the risk of unauthorized persons making changes to the disk images.
5. Log on to the NetBoot client computer again as the same user.
6. Using the Chooser on the client, locate and mount the Mac OS format volume on the Mac OS X Server on the client. Log on as a user with read and write access privileges (for example, the Administrator of the Mac OS X Server).
7. Open the volume and locate the Shared Images folder.
8. Locate the Mac OS ROM file and change its name to something other than Mac OS ROM. Do not throw it away, you will need it later.
9. Insert the Mac OS 9 CD.
10. Locate the System Folder on the Mac OS 9 CD. Open it and locate the Mac OS ROM file.
11. Drag the Mac OS ROM file from the Mac OS 9 CD to the Shared Images folder.
12. Open the Mac OS 9 installer and install an upgrade on the NetBoot HD. The client will restart after the upgrade. If the NetBoot HD is not

set as the startup disk, hold down the N key to make the client start up from the NetBoot HD.

13. After the restart, the client will start up the Mac OS 9 Setup Assistant. Do not use the Setup Assistant. Choose Quit from the File menu. If you have other upgrades to install, do so at this time.
    Important: Before you finish customizing the NetBoot image, be sure to install the latest version of Macintosh Manager client software, available from Apple Software Updates at http://www.apple.com/swupdates/. Then be sure to use the Multiple Users control panel to turn on Macintosh Manager and choose "Macintosh Manager account (on network)" in the Options... Other tab.
14. Using the Chooser on the client, locate and mount the Mac OS format volume on the Mac OS X Server on the client. Log on as a user with read and write access privileges (for example, the Administrator of the Mac OS X Server).
15. Locate the Shared Images folder and open it. Locate the Mac OS ROM file and name it something else. Locate the Mac OS ROM file you renamed in Step 8 and change its name back to Mac OS ROM.
16. Open the NetBoot Desktop Admin utility. Locate the System Folder and open it. Locate the Recent Documents, Recent Applications, and Recent Server folders and drag the contents of each folder to the Trash. Then close all the windows except for NetBoot Desktop Admin. Save the changes in NetBoot Desktop Admin. Note that this step prevents the user from seeing the various installers and other applications that were run during the modification of the images, but it is not a mandatory step.
17. The client restarts, this time using the operating system version you were upgrading from.
18. Open the NetBoot Desktop Admin utility one last time, and save changes.
19. When the client restarts, it should restart with Mac OS 9.
20. Verify that the file named Mac OS ROM in the SharedImages folder is the correct version for the version of Mac OS just installed. You can do this by selecting it and choosing Get Info from the Finder's File menu.

Unauthorized Changes To Hardware Void Warranty

This article explains Apple's warranty as it relates to hardware modifications. The information applies to all Apple products in all regions of the world.
This article has been archived and is no longer updated by Apple.
Changes made to Apple hardware that are not authorized by Apple may void the warranty. Accordingly, you can expect your service provider to charge you for service to that product if it requires service after the modification has been made. Further, if the modification alters a part so as to make it unfit and ineligible for parts exchange with Apple, a new part must be purchased. Note that pricing is typically significantly higher when parts cannot be sent to Apple for exchange.
Adding DRAM, VRAM or other user-installable upgrade or expansion products to an Apple computer is not considered a modification to that Apple product.

For more information, please see the following Knowledge Base articles:

Article 30284: "**Apple One-Year Limited Warranty: US & Canada**"
Article 58127: "**iMac: Modifying Logic Board Voids Warranty**"
Article 17402: "**Power Macintosh: Oscillator Chip & Warranty Implications**"

Final Cut Pro: Switching between Targa and DV Capture Settings

This article offers tips on how to switch back and forth between using a Targa 2000 Pro card and the built-in Apple FireWire interface to capture video. One solution takes advantage of the Multiple Users feature, available only to users of Mac OS 9.
This article has been archived and is no longer updated by Apple.
When using the Targa Driver software version 3.1 with a Targa 2000 Pro capture card and Final Cut Pro, difficulties may arise when you change the capture preferences from Targa to DV and then back to Targa. Afterward, when adjusting the Clip Settings for Brightness and Contrast in the Log and Capture window, the application may appear to freeze while waiting for these settings to update.

Solution One: Delete Preferences And Restart

You can delete the preferences file and restart the computer to eliminate this behavior when it occurs. Afterward, Final Cut Pro will function normally.

Solution Two: Multiple Users

A better solution is to use the Multiple Users control panel in Mac OS 9 to create multiple users, allowing you to quickly and easily switch between settings without having to restart the computer or discard the preferences file. This may be done even after the Targa Card and Final Cut Pro have been installed.

Assuming you chose the Targa settings when installing Final Cut Pro:

1. Make sure that Final Cut Pro is not currently running.

2. Open the Multiple Users control panel. Create two new users, one named "DV" and one named "Targa." Be sure to create Normal users and not Limited users, and give both equal read/write privileges. For more information on creating new users, please see article 31171: "**Mac OS 9: Set-up and Management of The Multiple Users Control Panel**"

3. From the Finder, open the Special menu and choose Log Out.

4. Log in as the user named "DV."

5. Open Final Cut Pro and change the capture settings to DV.

6. Quit Final Cut Pro.

Each user created in the Multiple Users control panel possesses its own set of preferences for each application. When you wish to capture DV material, simply quit Final Cut Pro, open the Special menu in the Finder and choose Log Out, log back in as the "DV" user, and open Final Cut Pro again. When you wish to capture with the Targa card, simply log out and log in as the "Targa" user. Each set of preferences is kept separate from the other, so there will be no conflict.

Final Cut Pro: Deleting Render Files

This article describes how to delete render files that apparently cannot be as a result of copying a sequence from one project to another.

This article has been archived and is no longer updated by Apple.
If you have copied a sequence from one project to another in Final Cut Pro, both sequences may end up sharing one or more of the same render files. This will result in not being able to delete the render files for the copied sequence. To change this, open up the sequence whose render files you wish to delete and change the parameter settings of any clips with filters or transitions attached. (For example, go into the Motion tab of a given sequence clip and toggle "Drop Shadow" on and off) This will break the link between the new sequence clip and the old render file.
Published Date: Feb 20, 2012

Final Cut Pro: "Out of Memory Errors" When Exporting EDL Files

This article discusses how to avoid getting Out of Memory errors when exporting EDL files from Final Cut Pro. It also covers how to correct this situation should it occur.

This article has been archived and is no longer updated by Apple.
When an Edit Decision List (EDL) of any format is exported from a sequence containing video transitions in video tracks other than V1, Final Cut Pro may give an "Out of Memory" error message, possibly causing the computer to hang. To avoid this, remove all video transitions in video tracks other than V1.

EDL files support only A/B roll transitions, (called the V1 track in Final Cut Pro terms) so making this correction will not hinder you from creating desirable EDLs for export. To add transitions in other tracks, using Opacity Levels on superimposed video tracks instead of transitions will result in Key values being added to the EDL. This will produce the desired effect.

Apple Remote Access: Supported Versions and Configurations

This article contains a chart that lists which Mac OS versions are compatible and supported with each version of Apple Remote Access.
This article has been archived and is no longer updated by Apple.
The following chart indicates which Mac OS versions are compatible and supported with each version of Apple Remote Access.

Apple Remote Access Version	Supported Mac OS Version
1.0	System 7.0.x
2.x (Client)	System 7.0 - Mac OS 8.5
2.x (Personal Server)	System 7.0 - Mac OS 8.5
3.0 (Client)	System 7.1 and System 7.5.3* - Mac OS 8.5
3.0 (Personal Server)	System 7.1 and System 7.5.3* - Mac OS 8.6**
3.1, 3.4 (Client)	Mac OS 8.6
3.5 (Personal Server)	Mac OS 9

Notes:
* Apple Remote Access 3 also requires Open Transport 1.1.1 or later.
**Apple Remote Access Personal Server 3.0 is not compatible with the version of Mac OS 8.6 that was pre-installed on iBook computers, slot-loading iMac computers and most Power Macintosh G4 computers.

Mac OS: Some Applications List Invisible Folders and Files in Open/Save Dialog

In some of my applications, I have noticed that I see folders that I do not normally see in the Finder. Should I save my documents in these folders?

This article has been archived and is no longer updated by Apple.
When an application calls for an Open/Save dialog, it notifies Mac OS of what kinds of folders and files should be listed for the user to choose from. Sometimes the application will list folders into which the user should not ordinarily be saving files.

Some of these folders include:

- Temporary Items
- Move&Rename
- TheVolumeSettingsFolder
- TheFindByContentFolder
- Cleanup At Startup

Desktop printers are also sometimes listed as folders in Open/Save dialogs.

You should avoid saving to folders that are not normally visible in the Finder because it may make locating the file more difficult later. Additionally, the file may later be deleted or moved to the Trash by Mac OS if saved into some of these folders.

It is up to each application to properly specify what kinds of folders and files should be listed in Open/Save dialogs. Please consult with the application vendor if you believe a folder or file is displayed in error.

iMovie: About Using with NetBoot, Macintosh Manager, or Multiple Users

This document describes iMovie's compatibility with NetBoot, Macintosh Manager, and Multiple Users environments.
This article has been archived and is no longer updated by Apple.
iMovie 1.0 and later is not compatible with NetBoot clients. In a typical NetBoot environment, the user's documents are stored on a central server, accessed over the network. The throughput requirements for capturing digital video are too high for actual the network speeds.

If you have NetBoot clients with Macintosh Manager authentication using iMovie 2, you should not use the NetBoot Applications volume feature of NetBoot, for best performance. Note: When you do not use the NetBoot Applications volume feature, you are limited to a 2GB NetBoot volume size limit for system and applications combined.

iMovie can be used with Macintosh Manager 1.2, or Multiple Users in certain environments. In Macintosh Manager, iMovie can be used by Finder and Restricted Finder workgroups. In order to give access to iMovie in a Restricted Finder workgroup, follow these steps:

1. Make sure that the iMovie folder is at the root level of the workstation's hard disk.
2. In Macintosh Manager admin, open the appropriate workgroup. Under the Items tab, add the iMovie application to the list of approved items for the workgroup.
3. Then, under Privileges tab, enter iMovie in the box next to "Folder on the startup disk named" and select Read & Write access.

In Multiple Users, iMovie can be used by Normal, Limited, and Panels users. For Limited and Panels users, simply movie the iMovie folder to the Shared Documents folder inside the Users folder on your hard disk. Access to this shared folder is on by default for Limited and panels users.

Note: By following these steps you will allow users to open iMovie, but you will also allow access to iMovie program files. You must take steps to ensure that users do not move or delete these files.

AppleShare Client: Crash When Logging on to iDisk or Mac OS X Server Volume

Occasionally, customers will experience system crashes when trying to log in to an iDisk or Mac OS X Sever volume after entering an invalid username or password at least once. The Finder or Login may unexpectedly quit, or an error Type 10 may result.
This article has been archived and is no longer updated by Apple.
This issue is related to the implementation of the DHX User Authentication Method used with AppleShare Client 3.8.5 to encrypt passwords before transmission to the server. Users who experience this issue with Mac OS 9, including all iDisk users, should upgrade to AppleShare Client 3.8.6 available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Users running another version of the Mac OS should refer to article 58523: "**AppleShare Client 3.8.6: Read Me**" to determine if an upgrade is appropriate.

Final Cut Pro: Targa Video Capture Cards Issues

This article describes known issues you may encounter when using Targa 1000/Pro and 2000/Pro video capture cards with Final Cut Pro.
This article has been archived and is no longer updated by Apple.

Known Issues

1. **Removing Targa cards from Final Cut Pro systems and switching to DV for capture**

When physically removing any Targa capture card, be sure to also remove the Targa Control Panel. Failure to remove the control panel can make it so you cannot adjust video settings for DV devices.

2. **Viewing External Video using the Targa series cards.**

For best performance with a Targa series card, the "View External Video Using" pop-up menu in the "General" tab of the Preferences window should be set to Rendered Frames, not "Targa." Failure to do so may lead to dropped frames.

3. **Installing a Targa 2000 non-pro card after installing Final Cut Pro.**

If, after installing a Targa 2000 non-pro card, no video appears in the capture preferences tab, do the following:

a) Go the Settings Folder in the Final Cut Pro Application Folder
b) Delete the file named "Capture Settings."
c) Go to the Final Cut Pro Data folder in the preferences
d) Delete the "Preferences" file.
e) Restart the computer

You can now go the Capture Preferences and adjust them to suit your needs.

4. **Using a Pinnacle Targa series card with an Apple 17-inch Studio Display.**

When you use a Pinnacle Targa series card with an Apple 17-inch Studio Display, the display is all green. For the monitor to display correctly, you must use the small black adapter cable that comes with the Pinnacle video card.
a) Turn off your computer and the monitor.
b) Connect one end of the adapter cable to the video card port on the computer
c) Connect the other end to the monitor cable.
d) Turn on your computer and monitor.

Colors should now display properly.

5. **Monitor resolution changing outside of user control when using some Targa cards**

If your monitor is connected to a Targa card, the monitor's resolution may change after you restart your computer and the image on the monitor may be scrambled. To view images correctly, connect a VGA-to-Mac converter, supplied with the card, to the card's port on your computer. Then connect a standard 15-pin VGA adapter (also called a VGA-to-Macintosh adapter) to the converter. Connect the monitor cable to the VGA adapter, then restart your computer.

6. **You must set sound input and output when using a TARGA card**

To hear audio from a TARGA card, use the Sound control panel to set the Sound In and Out to Targa. If the Sound control panel is not in the Control Panels folder within your System Folder, locate it in the Apple Extras folder on your hard disk and set the Sound In and Out to Targa.

7. **Truevision Targa audio issue: Audio Channel 2 (A2) inadvertently recording onto Audio Channel 1 (A1)**

When using Truevision hardware, if you capture audio from A2, you will get A1 from the deck. To work around this issue, capture A1+A2, then use the target track controls when editing the clip into a sequence to use only CH2.

8. **Setting resolutions when using PAL with a Targa card**

If you are using PAL with a Targa card installed, you need to confirm the resolution setting is correct after you install the Targa driver software. To do this:
a) Choose Preferences from the Edit menu
b) Click the Capture tab
c) Click Video under QuickTime Settings
d) Choose Compression from the pop-up menu.

e) Click Options
f) Select PAL (720 x 576)

9. **Capture fails while using a Pinnacle Targa series card**

If you're using a Pinnacle Targa series card, capturing clips can fail if the card does not have a good, steady signal during the capture process.

10. **Playing non-Targa clips when using the Targa board for display may result in poor playback**

Clips compressed with non-Targa codecs may perform poorly during playback when using the Targa 2000 as the video card.

11. **Targa 1000 and 2000 incompatibility with Medea hard drive arrays**

The Targa 1000 and 2000 (both normal and pro versions) are incompatible with hard drive arrays from Medea. Targa DTX and SDX cards do not have this issue and work properly with Medea arrays.

Final Cut Pro: 60 Hz Monitor Refresh Rate Interferes With Playback

This article describes how a 60 Hz monitor refresh rate can interfere with playback in Final Cut Pro.

This article has been archived and is no longer updated by Apple.
While playing clips in Final Cut Pro, you may notice dropped frames if the monitor is set to 60 Hz. To avoid this, be sure to set your monitor to a refresh rate above 60 Hz using either the Monitors control panel or the Monitor Resolution control strip module.

When setting a new refresh rate, 75 Hz is acceptable, but 85 Hz provides the best playback performance.

AppleWorks 6: Documents Open at Startup

If I have AppleWorks documents open and my computer stops responding or shuts down unexpectedly, the AppleWorks documents I was working on opens automatically when I restart. I would like to disable this function, but I cannot find a way to turn it off in AppleWorks preferences. Why does this happen and how I do I turn it off?
This article has been archived and is no longer updated by Apple.
This behavior is part of the new Auto-Save feature of AppleWorks 6. It allows you to recover work that you might not have saved if your computer stops responding for any reason. When you restart, AppleWorks automatically opens any document you were working on. If you made any changes since the last time you saved the document, you can recover those changes by selecting the Auto-Saved version of the document.

To prevent these documents from ever appearing on startup, disable the Auto-Save feature in the Files section of the Preferences panel. This prevents you from taking advantage of any Auto-Save features.

Alternatively, you can prevent these documents from appearing on a startup-by-startup basis. There are two ways to prevent these documents from appearing on restart:

Method One

1. Observe the startup process as extensions load and their icons appear at the bottom of the screen.

2. At any time after extensions begin loading but before the desktop appears, hold down the Shift key and keep it held down until startup is complete.

This prevents any startup items from being loaded during this startup.

Method Two

1. Hold down the space bar when you hear the startup chime.

2. When the Extensions Manager window appears, release the space bar.

3. Choose "View as folders" from the "Selected Set:" popup menu.

4. Scroll down to the Startup Items folder and deselect any AppleWorks document that you do not wish to open on startup.

5. Click Continue.
Your computer finishes starting up normally.

This prevents the deselected items from opening at startup until they are re-enabled.

Note: Any item you deselect is moved to the "Startup Items (Disabled)" folder inside the System Folder. You may wish to delete these items to prevent this folder from becoming cluttered. The items that AppleWorks places here are aliases, so they can be deleted without affecting the original document.

Final Cut Pro 1.2.1: Truncated Serial Number

When I try to register my Final Cut Pro software by entering the Final Cut Pro serial number, the OK button remains dimmed and I cannot continue. I am using the serial number found on the sleeve that holds my Final Cut Pro CD.

This article has been archived and is no longer updated by Apple.
There is an issue with the Final Cut Pro 1.2.1 serial number labels on some of the CD sleeves. The last two or three digits were not printed due to an internal printing fault. This issue has already been corrected in manufacturing.

If Final Cut Pro will not accept the serial number as it is entered, verify that the last four characters are "-340" (dash, three, four, zero) at the end of the serial number. It these any of these numbers are missing, please add them so that Final Cut Pro will correctly recognize the serial number as valid.

Also, make sure that you are not attempting to use the serial number for the QuickTime Pro upgrade that is also a part of the Final Cut Pro package. Additionally, be sure that the characters you enter are the same as the ones on the label. For example, don't confuse the letter "I" with the number "1", or the number "0" with the letter "O".

PowerBook, iBook: Compatibility With Norton DiskLight

This article discusses compatibility between both the PowerBook (FireWire) and iBook computers and a third-party utility, Norton DiskLight. This article has been archived and is no longer updated by Apple.
When Norton DiskLight is installed and the "Preserve Memory Contents On Sleep" feature is enabled in the Energy Saver control panel, a PowerBook (FireWire) or iBook computer may crash when going to sleep. To avoid this, either disable the Norton DiskLight extension or deselect "Preserve Memory Contents On Sleep" in the Advance Settings part of the Energy Saver control panel.

Note: For compatibility reasons, the Preserve Memory Contents on Sleep feature has been removed in Mac OS 9 versions 9.0.4 and later. You may still see the option in the Energy Saver control panel but it will be dimmed.

iMac (Slot Loading): Network Activities Prevent Deep Sleep Mode

If I manually put my iMac (Slot Loading) to sleep, the screen goes black and the power light changes to amber and pulses. If I set the computer to automatically sleep after 30 minutes, the power light stays green, which seems to indicate to me that the computer is not fully asleep. What can cause this behavior?

This article has been archived and is no longer updated by Apple.

When you set your iMac to automatically sleep after a specified period of time, an internal counter measures the amount of time your computer has been inactive. When the counter's time matches the amount of time you specified, the computer will go to sleep and display the pulsing amber light.

Network activities listed below can continually reset the idle counter so that the computer never fully sleeps:

- Having Personal File Sharing turned on.
- Leaving a Web page open in your browser which auto-refreshes itself every few minutes.

In these cases the display will sleep but the processor will continue to be awake and the power light will remain green.

To put your iMac (Slot Loading) computer into a deep sleep state you can do either of the following:

- Turn off File Sharing and quit other applications which could keep the computer active.
- Manually put the computer to sleep, either by selecting Sleep from the Special menu or by pressing the Power button on the keyboard and clicking the Sleep button in the resulting dialog.

Mac OS 9.0.4: Requires Apple DVD Player 2.2

Mac OS 9.0.4 requires Apple DVD Player 2.2 when installed on certain computers.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to Mac OS 9.0.4, the Apple DVD Player 2.0 application displays the following message:

> "Apple DVD Player does not support the video card used for the main screen."

Solution

Use the Software Update control panel to install Apple DVD Player 2.2, or later, or download it from the Apple Software Updates Web site at http://www.apple.com/swupdates/.

Note: Apple DVD Player 1.3, when used with DVD decoding hardware installed in Power Mac G4 (PCI Graphics), Power Macintosh G3, Power Macintosh G3 (Blue and White), PowerBook G3 Series, and PowerBook G3 Series (Bronze keyboard) computers, does not require an update. Apple DVD Player 1.3 is included with Mac OS 9.

Mac OS: Using Multiple Note Pads and Scrapbooks

Can I have more than one Note Pad or Scrapbook file?
This article has been archived and is no longer updated by Apple.
You may wish to create multiple Note Pad or Scrapbook files to organize your work, or to work around limitations of the Note Pad or Scrapbook applications.

System 7.1 and earlier
When the Note Pad's pages are filled up, rename its file stored in the System Folder to something like "NOTE 1". A new pad is created the next time you choose Note Pad from the Apple menu. If you need to look at something in the original pad, just rename your current file to something like "NOTE 2", and rename your original file (NOTE 1) back to "Note Pad File". The next time you choose Note Pad from the Apple menu, you access the one you just renamed. You can continue creating storage files for notes in this fashion until the disk fills up.

The same procedure can be applied to the Scrapbook File.

System 7.5 and Later
Included with Mac OS 7.5 and later are versions of these applications that support opening Scrapbook and Note Pad files from anywhere outside of the System Folder.

To create a new empty Note Pad or Scrapbook file, move the existing Note Pad File or Scrapbook File out of the System Folder, and then open the Note Pad or Scrapbook. A new empty data file is created in the System Folder.

To open a specific Note Pad or Scrapbook File, simply open the data file directly in the Finder instead of opening the Note Pad or Scrapbook application itself. By default, opening the Scrapbook or Note Pad application opens the data file in the System Folder.

iBook, PowerBook (FireWire): Issue With Preserve Memory Contents On Sleep

This article provides a workaround for an issue that may prevent your iBook or PowerBook (FireWire) from waking up from sleep.
This article has been archived and is no longer updated by Apple.
Note: For compatibility reasons, the Preserve Memory Contents on Sleep feature has been removed in Mac OS 9 versions 9.0.4 and later. You may still see the option in the Energy Saver control panel but it will be dimmed.

Apple has identified an issue in its system software that in very rare circumstances can prevent your computer from properly waking up from sleep. Though you will most likely never encounter this issue, all iBook and PowerBook (FireWire) owners should download and install the Sleep Memory Extension software patch, which eliminates this issue.

Note: This issue is addressed in Mac OS 9 Update (9.0.4). You do not need to install the Sleep Memory Extension if your computer is using Mac OS 9.0.4. Use the Software Update control panel to download and install the update. You can also download it from http://www.apple.com/support/downloads.

Installing the Sleep Memory Extension

To install the Sleep Memory Extension, do the following:

1. Download the extension.
2. Open the file named "Sleep Memory Extension.smi".
3. Read the Software License Agreement and click "Agree".
4. Open the volume named "Sleep Memory Extension".
5. Drag the Sleep Memory Extension onto the closed System Folder on your iBook or PowerBook (FireWire) hard disk. A dialog asks if you would like to place the item in the Extensions Folder.
6. Click Yes.
7. Restart your computer.

After restarting your computer, the "Preserve memory contents on sleep" checkbox still appears in the Energy Saver control panel, but the checkbox is dimmed and unavailable.

Mac OS 9: Temporary Items Not Moved to Trash

This article discusses an issue where Mac OS 9.0.x does not move items from the Temporary Items folder to the Trash if the computer stops responding or "freezes".
This article has been archived and is no longer updated by Apple.

Symptom

The amount of available space on your computer's hard disk seems to be dramatically decreasing even though you're not saving any large files on it. This symptom seems to occur especially after the computer stops responding or "freezes" when you are using a graphics application like Photoshop.

Solution

Install Mac OS 9.1. An update to Mac OS 9.1 is available from Apple Software Updates (http://www.apple.com/swupdates/).

In Mac OS 9, there is an invisible folder named Temporary Items that applications can use to store temporary files. For example, a graphics application can save changes to an image as temporary files so that the user can undo, or revert back to previous changes. Normally, these temporary files are deleted when the user quits the application.

If, however, the pointer "freezes" or the computer does not respond, the Finder moves any files in the Temporary Items folder to a Rescued Items folder in the Trash when the computer restarts. You can look in this folder for any items you wish to recover, or you can empty the Trash to recover the disk space.

With Mac OS 9.0.x, the Finder does not move files from the Temporary Items folder to the Trash. This can result in a noticeable loss of available space depending on how large the files are. This situation has been corrected in Mac OS 9.1.

If you don't update to Mac OS 9.1 you can use the AppleScript below as a startup item. Follow these steps to make the AppleScript applet:

1. Open the Script Editor, located in the AppleScript folder of the Apple Extras folder on the hard disk.
2. Copy and paste the AppleScript statements below into the Script Editor window.
3. Choose Save from the File menu and type a filename, such as Temporary Items Cleaner.
4. In the Save As dialog box, choose classic applet from the Format pop-up menu; two additional options appear in the dialog.
Note: If using Mac OS 8.6 or earlier, the Save As dialog reads Application, not classic applet.
5. Click Never Show Startup Screen.
6. Navigate to the Startup Items folder of the System Folder, and click Save.

This creates a small startup applet that works only with the versions of Mac OS 9.0.x that have this condition. It emulates the Finder's expected behavior by creating a folder called Rescued Items in the Trash that will contain any items found in the Temporary Items invisible folder. You can look in this folder for any items you wish to recover, or you can empty the Trash to recover the disk space.

```
--Begin AppleScript
tell application "Finder" to get the version
set FinderVersion to the result as text
if FinderVersion is less than "9.0" then
display dialog "This AppleScript requires Mac OS 9 or later."¬
 with icon stop buttons "OK" default button 1
return
end if

if FinderVersion is less than "9.1" then -- version with problem
tell application "Finder" to set BootVol to name of startup disk
set TmpItems to BootVol & ":Temporary Items:" as text

try
 set FolderContents to list folder TmpItems without invisibles
 if (count of FolderContents) is 0 then return
on error
 return -- probably no folder exists
end try

--Are there Rescued Items folders in the Trash already?
tell application "Finder" to get every item of trash ¬
```

```
 whose name begins with "Rescued Items"
set RescuedCnt to count of the result
if RescuedCnt is 0 then
 set RescuedItemName to "Rescued Items"
else
 set RescuedCnt to RescuedCnt + 1
 set RescuedItemName to "Rescued Items " & RescuedCnt as text
end if

tell application "Finder"
 --Finder cannot create new folders in the trash, so make one
 --on the desktop...
 make new folder at desktop with properties {name:RescuedItemName}
 -- and then move it to the trash
 move folder RescuedItemName of desktop to trash
end tell
--construct the rescue target path
set RescuedItemsPath to BootVol & ":Trash:" & RescuedItemName & ":" ¬
   as text

repeat with FolderItem in FolderContents
 set ItemPath to TmpItems & FolderItem as text
 set ItemInfo to info for alias ItemPath
 set ItemIsFolder to folder of ItemInfo
 if ItemIsFolder then -- It's a folder
  set ItemCanBeMoved to true
 else -- It's a file
  --busy check requires Mac OS 9 Standard Additions
  set ItemCanBeMoved to not busy status of ItemInfo
 end if
 if ItemCanBeMoved then
  try
   tell application "Finder" to move alias ItemPath to ¬
   alias RescuedItemsPath
  on error
   --something unexpected happened, keep going
  end try
 end if
end repeat
else
-- probably fixed after this release
end if
--End AppleScript
```

Note: A compiled version of this AppleScript is available at:

ftp://ftp.info.apple.com/Apple_Support_Area/Apple_Software_Updates/English-North_American/Macintosh/Misc/AppleScript/Remove_Temp_Items.bin

Final Cut Pro: Better Performance With Virtual Memory Turned Off

This article discusses why Virtural Memory should be turned off when using Final Cut Pro.

This article has been archived and is no longer updated by Apple.
Using Final Cut Pro with Virtual Memory turned on is not advised. Virtual Memory can potentially cause dropped frames on capture and playback, as well as sluggish performance.

To turn off Virtual Memory, quit Final Cut Pro, open the Memory control panel, and click the Off radio button (see Figure 1).

Figure 1 Memory control panel with Virtual Memory turned off

Once this is done, close the control panel and restart the computer for this change to take effect.

Published Date: Feb 20, 2012

Mac OS 9.0.2, 9.0.3: Computer Stops Responding When USB Device Is Connected

Some Macintosh computers with Mac OS 9.0.2 or 9.0.3 may stop responding when certain Universal Serial Bus (USB) devices are connected.
This article has been archived and is no longer updated by Apple.

Symptom

The computer may stop responding at system startup time if a USB device, like a floppy drive, is connected.

Products affected

- Power Mac G4 with Mac OS 9.0.2
- iBook with Mac OS 9.0.2
- PowerBook (FireWire) with Mac OS 9.0.2
- iMac (Slot loading) with Mac OS 9.0.3

Solution

Install Mac OS 9 Update (9.0.4) using the Software Update control panel. You can also download it from Apple Software Updates at http://www.apple.com/swupdates/ .

You can also work around this issue by waiting until the computer has started up before plugging in any USB devices. They should then work normally.

Published Date: Feb 20, 2012

AppleCare Protection Plan CD cannot start up all Macintosh computers

The AppleCare Protection Plan CD contains its own operating system and a diagnostic program named TechTool Deluxe. The operating system on this CD does not work with all Macintosh computers.
This article has been archived and is no longer updated by Apple.
TechTool Deluxe can still perform some tests if you copy it from the AppleCare Protection Plan CD to your computer's hard disk.

In order for TechTool Deluxe to perform any write-based tests or perform repairs, the computer must be started up from the AppleCare Protection Plan CD or from a Mac OS 9 Install CD (for computer models that will start up in Mac OS 9).

This document addresses three possible situations:

- If your computer will start up in Mac OS 9 and you have a Mac OS 9 CD that can start up the computer
- If your computer will start up in Mac OS 9 but does not have a Mac OS 9 CD that can start up the computer
- If your computer will not start up in Mac OS 9

Your computer can start up in Mac OS 9 and you have a Mac OS 9 CD that can start up the computer

The following steps will only work with the Mac OS 9 version of the TechTool Deluxe application versions 2.5.2 through 2.5.7. The Mac OS X versions of TechTool Deluxe, versions 3.0 and later, cannot be used in this manner.

The Mac OS 9 and Mac OS X versions of TechTool Deluxe have similar tests. If your computer can start up from Mac OS 9 and you have a CD that can be used as a Mac OS 9 startup disk, you only need to use the Mac OS 9 version of TechTool Deluxe to test your computer.

1. Make sure you have the latest update of TechTool Deluxe.
2. Start up the computer up from the hard disk.
3. Insert the AppleCare Protection Plan CD.
4. If you had to update your copy of TechTool Deluxe, the TechTool folder is already on your hard disk. If you did not have to update, copy the TechTool Deluxe folder (for your language only) from the TechTool Deluxe (Mac OS 9) partition of the AppleCare Protection Plan CD to your computer's hard disk.

   There are three versions of the TechTool Deluxe folder on the AppleCare Protection Plan CD. Copy the folder that is for your language version--you do not need to copy all three folders.
   - "TechTool Deluxe" is the English version
   - "TechTool Deluxe F" is the French version
   - "TechTool Deluxe J" is the Japanese version
5. Eject the AppleCare Protection Plan CD
6. Insert the Mac OS 9 System CD that came with your computer.
7. Restart your computer.
8. Press C to start up from the CD.
9. Use TechTool Deluxe in the folder that you copied to your hard disk.

If your computer will start up in Mac OS 9 but does not have a Mac OS 9 CD that will start up the computer

If your computer did not come with a CD that will start the computer up in Mac OS 9 and the AppleCare Protection Plan CD that came with your AppleCare Protection Plan does not start your computer, contact Apple to obtain the latest version of the AppleCare Protection Plan CD.

If your computer does not start up in Mac OS 9

If your computer does not start up in Mac OS 9 and the AppleCare Protection Plan CD that came with your AppleCare Protection Plan does not start your computer, contact Apple to obtain the latest version of the AppleCare Protection Plan CD.

AppleWorks 6: Generic White Icons in Web Starting Points

The Newsletter and/or Templates icons in AppleWorks 6 Starting Points may appear with a generic white icon. Clicking the icon does not open any content.
This article has been archived and is no longer updated by Apple.
The Newsletter and/or Templates icons in AppleWorks 6 Starting Points may appear with a generic white icon. Clicking the icon does not open any content. This symptom is a result of unusable cache files.

This happens when using:

- AppleWorks 6.0 and later

Take these steps to resolve the issue:

For AppleWorks versions 6.0.x:

1. Quit AppleWorks.
2. Open the AppleWorks folder.
3. Open the Starting Points folder.
4. Drag the Cache folder to the Trash.
5. Open AppleWorks.

For AppleWorks 6.1 and later:

1. Quit AppleWorks.
2. Open your Documents folder.
3. Open the AppleWorks User Data folder.
4. Open the Starting Points folder.
5. Drag the Cache folder to the Trash.
6. Open AppleWorks.

Appleworks will create a new Cache folder with new contents which should resolve the issue.

Macintosh Manager: Scheduled Shutdown

This article explains how to set up Macintosh Manager workstations to shut down at a specific time.
This article has been archived and is no longer updated by Apple.
You can use the Macintosh Manager administration application to schedule times for Macintosh Manager workstations to start up and shut down (on computers that support this feature). These settings overwrite those made in the Energy Saver control panel of individual workstations.

To specify startup and shutdown times for a group of workstations, open the Computer panel, and click the Control tab. Select the appropriate check boxes for scheduled shut down and startup times, and specify the time for each.

Workstations may not shut down on schedule if they are connected to the server at the login screen. To avoid this, select "Disconnect from the server if no user logs in within <> minutes," and specify a suitable amount of time. This ensures that idle clients are ready to be shut down when scheduled.

Published Date: Feb 17, 2012

Mac OS 9: Stops Responding at System Startup Time

In certain circumstances a hard disk can become extremely fragmented and fail to work as a startup disk when Mac OS 9.0.x is installed. When starting up you may see the "happy Macintosh" icon, but then the computer stops responding.
This article has been archived and is no longer updated by Apple.

Symptom

In certain circumstances a hard disk can become extremely fragmented and fail to work as a startup disk when Mac OS 9.0.x is installed. When starting up you may see the "happy Macintosh" icon, but then the computer stops responding. This may happen if the hard disk is nearly full, or if there are a very large number of files and constant file activity on the hard disk, such as a busy AppleShare IP server running Macintosh Manager.

Solution

1. Download Disk First Aid 8.6 from Apple Software Updates at http://www.apple.com/swupdates/.
2. Use Disk First Aid 8.6 to repair the disk.

Note: Disk First Aid 8.6 is not a defragmentation utility. If you are operating an AppleShare IP server or Macintosh Manager server under heavy load you should also download and install AppleShare IP 9.0.4 Update from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Installing Disk First Aid 8.6 onto a computer that will not start up

There are many ways to work around this issue. The method you use depends on whether the affected computer is on a network, what types of removable media (floppy, Zip, and SuperDisk disks, for example) are available to the affected computer, and which types of available removable media can be used when started up from a CD-ROM disc. Consider some of these methods:

- When the affected computer is on a network and will not finish starting up, download Disk First Aid 8.6 to another computer on the network. Start up the affected computer from a CD-ROM disc, then use AppleShare in the Chooser to connect to the computer that has Disk First Aid 8.6.
- When the affected computer has a partitioned hard disk or more than one hard drive, start up from an alternate partition or drive, then download Disk First Aid 8.6 directly to the affected computer. If there is not a System Folder on the alternate drive or partition, start up from a CD-ROM disc to install one.
- When the affected computer is connected to a removable media drive that can be used when started up from a CD-ROM disc but is not on a network and is not partitioned or connected to more than one hard drive, download Disk First Aid 8.6 at a remote location and place it on the removable media. Start up the affected computer from a CD-ROM disc and use the removable media to access Disk First Aid 8.6.
- If you have access to a CD burner, you may create a startup disc that has Disk First Aid 8.6 on it.

Ethernet Update 1.0: Description

This article describes the Ethernet Update 1.0. Ethernet Update 1.0 improves the reliability of Ethernet in certain rare network configurations. The update addresses an Ethernet issue where a Macintosh after a period of time that varies by network topology, infrastructure and traffic may continue to transmit but does not receive packets.
This article has been archived and is no longer updated by Apple.

Products Affected

- iMac (Slot Loading) computers manufactured since early November 1999
- Power Mac G4 (AGP Graphics) computers manufactured since late November 1999
- PowerBook (FireWire)
- iBook (pre-FireWire)

Solution

It is not necessary to install this update unless you are experiencing reliability issues with your Ethernet networking configuration.

Nor is it necessary to install the Ethernet Update 1.0 if your Macintosh has Mac OS ROM 3.8 or later, as these versions of the Mac OS ROM already contain the Ethernet Update. The Mac OS ROM is stored in the System Folder and the version is listed by Apple System Profiler in the System Tab under Product Info.

Ethernet Update 1.0 improves the reliability of Ethernet in certain rare network configurations. These configurations are typically 10 Mbit networks which include coax (10Base5 or 10Base2) network segments in large single collision domains (not separated by switches, for example) that use much smaller than standard interpacket gaps or have carrier collision dropout. This update replaces the Mac OS ROM file with a new version, 3.8.

The Ethernet Update 1.0 requires Mac OS 9.0.4. Both the Ethernet Update and Mac OS 9.0.4 are available from Apple Software Updates at http://www.apple.com/swupdates/ .

For more information on this issue, please see article 25147: "**Ethernet Update 1.0: Determining Whether to Install It.**"
Published Date: Feb 20, 2012

Ethernet Update 1.0: Determining Whether to Install It

This article discusses whether it is advisable to install Ethernet Update 1.0 on your Macintosh computer. It also offers a procedure for determining whether a Macintosh computer is affected by the issue that Ethernet Update 1.0 resolves.

This article has been archived and is no longer updated by Apple.
It is not necessary to install this update unless you are experiencing reliability issues with your Ethernet networking configuration.

Ethernet Update 1.0 addresses an issue where a Macintosh in certain rare network configurations may continue to transmit data but not receive data. Manually putting the Macintosh to sleep and then waking it, or restarting the computer enables it to temporarily reestablish network connectivity. After a period of time, which varies by topology and infrastructure, the computer again ceases to receive packets. The computer functions normally on isolated networks.

Products Affected

- iMac (Slot Loading) computers manufactured since early November 1999
- Power Mac G4 (AGP Graphics) computers manufactured since late November 1999
- PowerBook (FireWire)
- iBook (pre-FireWire)

Determining if the Issue Exists
The existence of the issue described in this article can be determined with the SNMP Administrator program. Follow these steps to install it:

1. Perform a custom installation of system software from the Mac OS 9 CD, installing only the SNMP agent.
2. Copy the SNMP Administrator program from the CD to the hard disk. (Mac OS 9 CD: CD Extras: Network Extras: OT Extras: SNMP Admin: SNMP Administrator)
3. Restart the computer.

When you suspect your Macintosh has lost connectivity to the network, then:

1. Open the SNMP Administrator. The Community List dialog box appears.
2. Open the "public" community in the Community List dialog box.
3. Click the Interface Agent tab; the ifNumber and ifTab are shown.
4. Double-click ifTable (the name, not the tab); the Variables Values window appears.
5. Scroll through the window until you locate ifInOctets and ifOutOctets.
6. Write down the Value for the ifInOctets and ifOutOctets.
7. If AppleTalk is active, open the Chooser. Click the AppleShare icon, then the LaserWriter icon, and perhaps even the AppleShare icon once again, then close the Chooser. Alternatively, open a web browser and load a page such as www.apple.com . (Note that these actions should not display AppleShare servers or LaserWriter printers in the Chooser, nor display the web site you entered.)
8. Click the SNMP Administrator window to make it active.
9. Click Update.
10. Record the ifInOctets and ifOutOctets counts again.
11. Compare the ifInOctets and ifOutOctets values:
    - If the ifInOctets count does not increase in value after the fault occurs and the ifOutOctets does increase in value, make sure you performed steps 7 through 9. If you did perform steps 7 through 9 and the IfInOctets did not increase in value, then this computer has encountered this Ethernet issue and would benefit from installing the Apple Ethernet Update 1.0.
    - If the ifInOctets and ifOutOctets values both continue to increase in value then this Macintosh has not encountered this issue, but instead has encountered some other difficulty. It may require additional network troubleshooting. You may wish to search the Knowledge Base for troubleshooting tips or for other known issues such as with the Spanning Tree Protocol: Article 30922: "**Spanning Tree Protocol: AppleTalk Issues**"

After conducting this test with SNMP Administrator, you may wish to remove or disable the following extensions if you don't intend to routinely use SNMP Administrator or other SNMP Management Consoles or tools:

- Open Transport SNMP
- OpenTptSNMPLib

Published Date: Feb 20, 2012

Macintosh Manager: Using the Update Package

The Macintosh Manager Read Me files released with 1.2 - 1.3 refer to files that do not exist. The following document addresses these name issues and has the correct instructions for using the update package.

This article has been archived and is no longer updated by Apple.
In the Macintosh Manager Read Me, the following appears under the topic "Using the update package":

"To use the auto-update package, do the following:

1. Open the Macintosh Manager Installer disk image and locate the "MM Update Package" file, which should be inside the Update Package folder.

2. Copy the "MM Client Package" file to the top level of your Multi-User Items folder on the server. This folder should be located inside the Macintosh Manager share point on the server."

The file names "MM Update Package" and "MM Client Package" are supposed to read "Update Package 1.x" (1.x being the version of the Updater you are using).

The steps to use this feature are the same and the software will update as it is intended. However, the references in the Read Me are incorrect. The correct version is:

"To use the auto-update package, do the following:

1. Open the Macintosh Manager Installer disk image and locate the "Update Package 1.x" file, which should be inside the Update Package folder.

2. Copy the "Update Package 1.x" file to the top level of your Multi-User Items folder on the server. This folder should be located inside the Macintosh Manager share point on the server."

Final Cut Pro: Setting Real-Time Audio Mixing Tracks Preference

The Real-Time Audio Mixing setting in the General Preferences tab is a useful tool for optimizing playback performance in Final Cut Pro. This article describes its use, as well as the use of the Mixdown Audio command to force render multiple audio tracks in situations where it may improve playback performance.

This article has been archived and is no longer updated by Apple.
The Real-time Audio Mixing setting in the General Preferences tab (see Figure 1) defines how many audio tracks Final Cut Pro attempts to mix without rendering. If too many tracks are set, video playback performance may suffer. If too few tracks are set, Final Cut Pro renders audio prior to playback when more audio tracks are used in an edit than are specified.

Figure 1 Real-time Audio Mixing setting in the General Preferences tab
The maximum number of tracks you can enter into this field varies depending on CPU speed and type, hard disk performance, available memory, and other factors. To determine the maximum number of audio tracks that will play along to video without having to render, follow these steps:

1. Create a new project. Import one video clip and one audio clip.

2. Set the Real-Time Audio Mixing field of the General Preferences tab to a deliberately high number, such as 16. This is to prevent Final Cut Pro from making any assumptions about what can be played back without rendering. Also, be sure to enable the Report Dropped Frames option in the Capture Preferences tab.

3. Edit the video and audio clip into the timeline of Sequence 1, occupying the same area of the timeline.

4. Now, a track at a time, edit additional clips of audio into additional audio tracks so that they overlap the previously edited material, and play them back. As long as Final Cut Pro does not report any dropped frames, continue adding tracks.

5. As soon as a dropped frame is reported, you know that you are one track over the maximum number of tracks that you can enter into the Real-Time Audio Mixing field.

Adding audio filters and mixing levels reduces the number of tracks that play back without rendering. In these cases, it may be prudent to lower the number specified in the Real-Time Audio Mixing field to prevent inconsistencies during playback.

In cases where there are perhaps too many tracks or effects applied to allow for real-time audio mixing, the Mixdown Audio command (see Figure 2) forces Final Cut Pro to render all audio tracks in order to optimize playback performance. Using this command does not result in all tracks being destructively mixed into one track in the Timeline. It simply refers to the process of all tracks being rendered to cache files in advance of playback.

Figure 2 Mixdown Audio menu item

Note: If you have complex multi-layered audio and want to recut your visuals without constantly re-rendering, please see article 31218: "**Final Cut Pro: Avoiding Rendering of Audio Clips When Using Filters**"

Final Cut Pro: Using Serial Device Control with FireWire Capture

This article describes how to use Serial Deck control when capturing or outputting with RS-232 or RS-422 DV decks.

This article has been archived and is no longer updated by Apple.
Serial device control is most commonly used with high-end VTRs (such as those for the BetaSP and Digi-Beta tape formats). If you have a high-end DV deck, (for example, the DSR-40) and wish to capture video using the FireWire interface, you can still use serial device control to capture the timecode. Use a USB to Serial adapter to connect an RS-232 or RS-422 cable from the deck to the Macintosh. See Figure 1.

Figure 1 Cabling diagram

After connecting the serial adapter and the FireWire cables, specify the Protocol (RS-232 or RS-422), Time Source (LTC+VITC), and the Port (Printer Port USB), in the Device Control Preferences tab. See Figures 2-4.

Figure 2 Device Control Preferences tab as seen from the Log and Capture window

Figure 3 Device Control Protocol options

Figure 4 Time Source options

Make sure your FireWire device is connected and turned on. Then, in the Capture tab, open the video source window by clicking the Video button, then choosing Source in the upper left hand popup menu. Set the source to DV Video. See Figure 5. In this way, the timecode is recorded from the serial adapter, even though the video is from FireWire.

Figure 5 Video Source popup accessed through the Video button in the Capture Tab

Published Date: Feb 20, 2012

Final Cut Pro: How to Calibrate Serial Timecode

This article has been archived and is no longer updated by Apple.

Unless you're capturing a DV or HD video format via FireWire, the timecode and audio/video signals are received separately by Final Cut Pro. Timecode is captured via the serial device control cable (using RS- 422 format in most cases), while audio/video is captured via the cable connected to the video capture interface (composite, S-video, component, or SDI). Because the signals are separate, they can possibly arrive at different times, causing the wrong timecode number to be recorded onto captured video frames. In the case of formats captured over FireWire, the FireWire cable is used for both.

You can calibrate your timecode and video capture setup by adjusting the number of frames that timecode signals are offset from video input by using the Capture Offset field. Apple-qualified video capture devices include software with pre-configured Easy Setups. The supplied Easy Setups will set the Capture Offset to a correct value for that device and media format when using many VTRs and configurations.

If timecode is an important part of your workflow, it's a good idea to check the calibration prior to beginning a project (see steps below). After the initial accuracy of the timecode is verified, there are a number of factors that might require adjustment of the Capture Offset value:

- Capturing media acquired with unknown or known faulty equipment (for instance, if you did not shoot the video yourself, or if it is otherwise of unknown origin).
- Changes in the type of timecode used during captures (i.e. LTC, VITC, etc.).
- Changing from one make and/or model deck to another.
- Even between two decks of the same make and model, if one is programmed with a different firmware version than the other, there may be slight differences requiring calibration. Many higher end and multi-format capable decks are programmed with firmware that can be updated as revisions are made available. You should consult the literature that accompanied the deck or contact the manufacturer to determine how to identify and update the firmware versions.
- Using a serial device control switcher or router.
- Switching from one port to another.

If you find you are impacted by any of these factors that are causing variance in timecode accuracy, it's a good idea to create separate device control presets, with different Capture Offsets for each configuration. The pre-calibrated presets let you quickly change configurations without having to go though the whole calibration procedure again. For more information the topics covered in this document, see the Final Cut Pro User's Manual.

Note: The Final Cut Pro User Manual suggests that you need to calibrate the video and timecode signal every time you change decks or cables. While it's a good idea to calibrate for different decks, changing cables alone is not likely to affect timecode accuracy.

Determining and Entering the Timecode Offset
You can easily determine if there is a difference between the timecode and video signals by capturing test footage that has timecode "burned in" to the video picture information. By comparing the numbers in the timecode track to the timecode numbers in the video picture, you can determine the offset between them.

If there is an offset, you can calibrate your timecode and video capture setup by entering the number of frames by which the timecode signals are offset from the video in the Capture Offset field of the current device control preset.

To determine the timecode offset:

1. Do one of the following:
   - Create a window-burn (or window dub) test tape for timecode offset testing. You can do this by transferring a tape with timecode to another tape of the same format, making sure you connect an output that can display timecode information visually.
   - Connect the *monitor out* (or *super out*) output of your VTR to the input of your video interface. A monitor output is a dedicated output for displaying VTR status information such as a timecode counter superimposed (or "burned-in") over the video information. Some VTRs don't have a separate monitor output, but instead have an option for turning on the deck status display and timecode information on the main output. Enable this option.
2. Capture a clip of video from a tape with LTC (Longitudinal TimeCode) or VITC (Vertical Interval TimeCode) timecode on it.
3. Compare the timecode value recorded in the captured media file (in the Current Timecode field) with the burned-in timecode on the video frame.
   If both timecode values match, then there is no offset, so no adjustment is necessary. If the timecode values do not match, there's an offset and you'll need to compensate for this to capture your video properly.

To enter a timecode offset:

1. Choose **Final Cut Pro** > **Audio/Video Settings**.
2. Click the Device Control Presets tab.
3. Make sure your current method of device control is checked, then click Edit.
   If you're using a locked preset, a new copy of the preset is created.

4. Enter a new name and description for this device control preset indicating which camcorder or deck it is calibrated for.
5. Enter a number of frames in the Capture Offset field, then click OK.

Enter a negative number if the clip's timecode track has higher numbers than the burned-in timecode. For example, if the clip's Media Start timecode is 01:00:00:04, and the first video frame has a burned-in timecode number of 01:00:00:00, enter -4 in the Capture Offset field.

After entering the timecode offset, it's a good idea to capture a few more clips and compare the timecode track numbers with the burned-in timecode to determine if the timecode offset you entered is correct.

Some devices may require fractional offsets to maintain accuracy over long batch captures. For example, if in a single clip capture an offset of 2 yields the desired results, but a 10 clip batch capture shows some clips accurate and others not, try an offset of 2.5. You may wish to consult the device documentation for specific tips on which offsets to use.

Final Cut Pro: Resolving Timecode Errors

Final Cut Pro has been designed to reliably capture frame accurate timecode from a variety of sources, but certain situations may impede this accuracy. Incorrect reel numbers, breaks in timecode, and failure to calibrate the Timecode Offset Preference can all adversely affect timecode accuracy. This article describes these situations, and how to get resolve them.

This article has been archived and is no longer updated by Apple.
There are two ways that Final Cut Pro can capture timecode while importing video clips. One is through FireWire (the solution available on most consumer DV equipment), the other is through serial device control (either RS-232 or RS-422) on professional VTRs.

FireWire Device Control

There is one important issue to note when using FireWire timecode to capture DV material. When capturing video recorded with miniDV camcorders, it is important to remember that every tape you record starts at hour 00:00:00:00. Unlike DVCam or other professional formats, miniDV does not have user selectable timecode (the ability to manually set at what hour the timecode starts). When batch capturing material from of multiple tapes, it is important to assign individual reel numbers to each tape, and to physically write these reel numbers on the tapes themselves so there is no confusion.

With this in mind, be aware that any timecode break on a miniDV tape results in the timecode resetting itself back to 00:00:00:00. When this happens, it means that there are essentially two or more reels on one tape. This should be avoided because it causes unnecessary confusion, but when it does occur you should note this fact on the tape. Give each section of the tape its own reel number. For example:

- Tape 10
- (timecode break)
- Tape 10a

Be sure to always fast forward the tape to the appropriate section when prompted by Final Cut Pro for Tape 10a before pressing the Okay button.

Serial Device Control

There are two common sources of timecode errors you may encounter when using Serial device control to capture timecode, and both are easily avoided if you are conscientious.

The first occurs when there are timecode breaks on a tape. Timecode breaks occur when a tape is started or stopped while it is being recorded, and a gap appears in the timecode track. This can happen if the camera is powered off while being used in the field, or for any one of a number of other reasons. Timecode breaks do not appear after every shot, but they are not infrequent in typical source material. You may be tempted to record long video clips when logging tapes and capturing material in Final Cut Pro, but the danger in doing so indiscriminately lies in the possibility of capturing a clip with a timecode break somewhere within it.

When this happens, the timecode of the clip is incorrect, resulting in an incorrect offset of the timecode starting at the point of the clip where the timecode break occurred. Video clips with this error can not be recaptured, which can cause significant difficulties. Final Cut Pro warns you of this, but in the case of a large batch capture, it may be difficult to determine which clip is at fault.

The solution to this is simply to take more care in logging and capturing video clips. Shorter, rather than longer, clips should be captured so that when a timecode break occurs, it only affects one or two shots rather than ten minutes worth of material. Furthermore, any visible glitches on the tape should be noted and avoided during the logging process.

The second source of timecode errors occur when the Timecode offset in the Device Control Preferences tab is not calibrated properly.

Figure 1 The Timecode Offset in the Device Control Preferences tab

This can be especially problematic if project files are moved frequently from location to location, between different Final Cut Pro editing workstations. If any of the workstations in question are not calibrated properly and video material is recaptured, all recaptured clips will be offset incorrectly, and all of the in and out points in that project's various sequences will be incorrect. The solution is simply to delete the problematic video clips, recalibrate the Timecode Offset, and recapture the material. For more information on recalibration, please see article 25154: "**Final Cut Pro: How to Calibrate Serial Timecode**"

PowerBook (FireWire): Computer Does Not Recognize FireWire Devices

Under certain circumstances, a PowerBook (FireWire) computer may not recognize FireWire devices. This article tells how to resolve the situation.

This article has been archived and is no longer updated by Apple.

Symptom

A computer stops responding "freezes," and after it is restarted it does not recognize any FireWire devices.

Solution

Install PowerBook Firmware Update 2.7, available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Published Date: Feb 20, 2012

Macintosh Manager: Error -5019

Attempts to connect to a Macintosh Manager server result in a connection failure with error -5019. The solution lies in repairing AFP privilege information on the server.
This article has been archived and is no longer updated by Apple.

Symptom

Attempts to connect to Macintosh Manager server as either administrator or client result in connection failure, with a -5019 error (AFP Parameter error). Deleting the Multiple Users user and letting the server make a new one automatically does not resolve the situation.

Solution

This behavior is likely due to damaged AFP privilege information on the server, which can occur if the Admin workstation or the server stops responding ("crashes" or "freezes") or is force-restarted while privileges are being altered. Here are some possible solutions:

- Use Disk First Aid to fix any damaged directories that may cause this error.
- Verify that the entire Macintosh Manager folder (directory tree) is still owned by "Multiple Users User". To do this, select "Set Privileges" in Mac OS Server Admin, and choose the Macintosh Manager directory. It will probably show that Multiple Users User owns it, and has read-write privileges, but this doesn't prove that everything inside is set the same
  way.
- Click the "Copy" button ("Copy these privileges to all enclosed folders"). This will ensure that Macintosh Manager's Multiple Users User can access everything within the entire directory tree. *****
- It may be necessary to reconstruct either Users and Groups Datafile or each volume's AppleShare PDS file, or both, using AppleShare IP First Aid. (Be sure to read the "Read Me" file for AppleShare IP First Aid before using it. Make backups as suggested before proceeding with reconstruction.)

***** **Note**: This procedure may take several minutes, depending on the number of items involved, the degree of directory branching, and the speed of the host computer.

Macintosh Manager: Settings Disappear After Logging In

After logging in to a computer using Macintosh Manager, some settings seem to have disappeared, and other features no longer work.
This article has been archived and is no longer updated by Apple.

Symptom

You log in to the computer, and find that one or more of the following symptoms occur:

- Your computer no longer has access to the network.
- The Control Strip does not work.
- Settings you've made in the Internet control panel no longer work.

When you log on as a user to the Limited Finder or Panels environment, Macintosh Manager moves certain items to the Secured Items folder within the System Folder as a safety measure. When you log off, Macintosh Manager restores these files to their prior location. Some of the folders include:

- Secured Extensions
- Secured Control Panels
- Secured Apple Menu Items
- Secured Desktop Items
- Secured Desktop Printers

If you do not log off completely and successfully (for instance, a power failure occurs, or the computer "freezes" or stops responding and you restart the computer), files from these folders do not get moved back to their correct locations.
Published Date: Feb 17, 2012

Macintosh Manager: How to Set up for Email

This article explains how to configure Macintosh Manager to check email for users when they log in.

This article has been archived and is no longer updated by Apple.

Step One

Make sure the user has a POP email account.

Step Two

Open the Macintosh Manger Admin application program.

Step Three

Enter the email and account information into the Computers:Control:Generate User E-Mail Addresses section. See Figure 1.

Figure 1 Email Account Information

Step Four

Enable the "check for e-mail when members log in" option. See Figure 2.

Figure 2 Enabling Email Check

Step Five

Enable "Put e-mail info in Internet Preferences." See Figure 3.

Figure 3 Internet Preferences

Step Six

Allow access to Control Panels (at least once) for this workgroup, and enter the email account password in the email section of the Internet control panel while logged in as the user. See Figure 4.

Figure 4 Entering Email Password

The user sees an alert box regarding email after logging in. See Figure 5.

Figure 5 Email Alert Box

AppleWorks 6: "Main Spell Dictionary Not Installed" Error Message

This article tells what to do if the error message, "The Main Spell Dictionary is not installed" appears in AppleWorks while checking spelling.

This article has been archived and is no longer updated by Apple.
An alert box appears when you try to check spelling. The error message states:

> "The Main Spell Dictionary is not installed."

This happens when using:

- AppleWorks 6.0 through 6.1.2

The AppleWorks application has been moved from its original folder and now cannot find the Main Spell Dictionary file. Follow these steps to resolve the situation:

1. Quit AppleWorks.
2. Move the AppleWorks application program icon back to the AppleWorks 6 folder that was created by the installer.
3. Open AppleWorks.

Apple DVD Player: Version 1.3 and Earlier Do Not Play Through USB Speakers

When playing a movie from a DVD-Video disc, sound does not play through USB speakers connected to the computer. This article lists the affected computers and offers a solution.

This article has been archived and is no longer updated by Apple.

Symptom

When playing a movie from a DVD-Video disc, you can't hear the movie through USB speakers connected to the computer. Other sounds, such as alert sounds and CD audio, can be heard through the USB speakers. You can hear the movie if you use the computer's built-in speaker(s) instead of the USB speakers.

Products affected

- Apple DVD Player 1.3 or earlier
- PowerBook G3 Series (Bronze keyboard)
- Power Macintosh G3 with third-party USB card
- Power Macintosh G3 (Blue and White)
- Power Mac G4 (PCI Graphics)

Solution

- Use the computer's built-in speaker(s).
- Connect external speakers or headphones to the computer's analog sound output port. (Some USB speakers accept analog input. Check the documentation that came with the speakers to see if they can be simultaneously connected to the sound output port on the back of your computer.)

PowerBook, iBook: Processor Cycling

This article defines processor cycling, tells how to turn it off, and explains its effect on a computer.

This article has been archived and is no longer updated by Apple.

Processor Cycling Defined

Processor cycling is an energy-saving feature built into PowerBook and iBook computers. It increases battery life by slowing down the processor when the computer is not being used. Processor cycling slows the processor to approximately 25 percent of its normal speed.

Turning off Processor Cycling

PowerBook and iBook computers come with processor cycling turned on when running on battery power. You can disable processor cycling by following these steps:

1. Open the Energy Saver control panel.
2. Click Advanced Settings.
3. Click the checkbox to deselect the "Allow processor cycling" option.

There are certain events that prevent processor cycling from working, even when it is enabled:

- moving the mouse
- typing on the keyboard
- saving or reading files on the hard disk
- reading a CD-ROM or DVD-ROM disc

Side Effects

If a program is running and you're not using the mouse, keyboard, hard disk, or CD-ROM/DVD-ROM discs, processor cycling can cause the program to slow. For example, Macromedia Flash animations, which run entirely from RAM, may become choppy due to processor cycling.

Belkin ADC to DVI Connector Cable Overview

This document describes the Belkin ADC to DVI connector cable which allows you to connect either an Apple Cinema Display or Apple Studio Display with a DVI connector to a Power Mac G4 computer with an Apple Display Connector (ADC).
This article has been archived and is no longer updated by Apple.
The original Apple Cinema Display and the Apple Studio Display-which use the digital video interface (DVI) connector-were designed to work with the graphics card in the Power Mac G4 (AGP Graphics) computer. The graphics card in later Power Mac G4 computers utilizes an Apple Display Connector (ADC) video card. Refer to technical document 58692: "**Power Mac G4: Display Compatibility**" for images and additional information on the video connectors.

Belkin offers an ADC to DVI cable adapter that allows you to connect either monitor to a computer with an ADC video card. Refer to Table 1 to determine compatibility. Figures 1 through 3 offer views of the cable adapter.

Computer	Computer Video Port	Apple Studio Display	Apple Cinema Display
Power Mac G4 (AGP Graphics)	DVI	Yes	Yes
Power Mac G4 (Gigabit Ethernet) and (Digital Audio)	ADC	Yes (with adapter)	Yes (with adapter)
Power Mac G4 Cube	ADC	Yes (with adapter)	Yes (with adapter)

Table 1 Computer and display compatibility

Figure 1 Connector Cable

Figure 2 View of connector plug

Figure 3 View of connector socket

Notes

1. The cable adapter only carries the video signal to the display. You must also plug in the display's power cord, and connect the display to one of the computer's USB ports.

2. This adapter is designed only to allow DVI based displays to be connected to an ADC video card. This adapter does not allow you to connect ADC displays to a video card with a DVI port.

This document provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

iMovie 2.0.1 Update "File not found" Error Message

Do not install iMovie Update 2.0.1 if your computer already has iMovie 2.0.1.
This article has been archived and is no longer updated by Apple.

Symptom

Installing iMovie 2.0.1 Update on a computer that already has iMovie 2.0.1 results in an alert box, shown in Figure 1, with the following error message:

> "An error occurred that prevented the installation from completing. File not found: Find iMovie."

Figure 1 iMovie error message

Solution

Do not install iMovie Update 2.0.1 if your computer already has iMovie 2.0.1.

iMovie Update 2.0.1 updates iMovie from version 2.0 to version 2.0.1. The updater specifically searches for iMovie 2.0. If your computer does not have iMovie 2.0, the updater presents the alert box.
Published Date: Feb 18, 2012

Cannot Start up From Third-Party USB Drive

Your computer may not start up correctly from a USB hard disk if the manufacturer's hard disk driver is outdated.

This article has been archived and is no longer updated by Apple.

Symptom

Your computer may not start up correctly from a USB hard disk if the manufacturer's hard disk driver is outdated.

Solution

Check with the USB hard disk driver manufacturer for updated driver software. In the meantime, you may be able to start up from the USB hard disk by removing the manufacturer's hard disk driver extension from the Extensions folder in the System folder, and then starting up from the USB disk.

TechTool Deluxe: Features

This document lists the features of the TechTool Deluxe application included on the Apple Protection Plan CD.
This article has been archived and is no longer updated by Apple.
The Apple Protection Plan CD contains a diagnostic program named TechTool Deluxe.

TechTool Deluxe is an abridged version of the TechTool Pro diagnostic utility made by MicroMat. TechTool Deluxe is available only through Apple by purchasing the Apple Protection Plan for your Macintosh computer. Through the AppleCare Protection Plan, Apple provides technical support for TechTool Deluxe.

TechTool Deluxe for Mac OS 9 offers these features:

- Mac OS 9 compatible
- Mac OS Extended Format (HFS Plus) compatible
- PowerPC compatible
- Checks logic board
- Checks RAM
- Checks PRAM
- Checks video RAM
- Checks ROM
- Checks CPU
- Checks FPU
- Checks cache
- Checks clock chip
- Disk structure repair
- Bad block reassignment
- File integrity check
- Rebuilds directories instead of patching
- Checks drive mechanism
- Repair preview

On the Mac OS 9/Mac OS X dual Apple Protection Plan startup CD, there is a Mac OS X compatible version of TechTool Deluxe.

TechTool Deluxe for Mac OS X offers these features:

- Mac OS X compatible
- Mac OS Extended Format (HFS Plus) compatible
- PowerPC compatible
- Checks processor
- Checks RAM
- Checks video RAM
- Checks USB
- Checks drive mechanism
- Checks volume directory structure
- Rebuilds directories instead of patching
- Repair preview

TechTool Deluxe can repair certain faults if detected, but only if the computer started up from the CD.

It is possible to upgrade from TechTool Deluxe to TechTool Pro. For more information on upgrading contact MicroMat (http://www.micromat.com/).

PowerBook: How to Determine if Firmware Update 2.7 Is Needed

This article explains how to determine whether your PowerBook computer needs the PowerBook Firmware Update 2.7.

This article has been archived and is no longer updated by Apple.
Follow these steps to determine whether your PowerBook computer needs the PowerBook Firmware Update 2.7:

1. Open the Apple System Profiler application program; the Apple System Profiler window appears.
2. Reveal the product information by clicking the Product Information disclosure triangle.
3. Note the Boot ROM version. If it is $0003.27f2 or later, the PowerBook does not require PowerBook Firmware Update 2.7. If an earlier Boot ROM version is listed, such as $0003.24f1, you should install PowerBook Firmware Update 2.7.

For the PowerBook Firmware Update 2.7 software and Read Me document, please see article 88042: "**PowerBook Firmware Update 2.7 Document and Software**"
Published Date: Feb 20, 2012

Mac OS X Server: How to Upgrade Mac OS for NetBoot Clients

This article tells how to upgrade the version of Mac OS used by NetBoot Clients, and how to deal with Mac OS ROM startup issues that may arise during the process.

This article has been archived and is no longer updated by Apple.
This article assumes the reader is familiar with using NetBoot Desktop Admin to upgrade the images used by the NetBoot Clients. If not, consult the NetBoot Desktop Admin Read Me before continuing.

Create the private images

1. Log on to a NetBoot client computer as a Global Administrator who belongs to the System Access workgroup.

2. Connect to the NetBoot Server volume. Open the NetBoot Desktop Admin application program.

3. Using NetBoot Desktop Admin, increase NetBoot HD.img image so that there is at least 250 MB of free space. (You cannot reduce the size of an image without reverting to a backup copy.)

4. Click Make Private Copy. NetBoot Desktop Admin creates copies of the disk images that you can change. This may take several minutes; you should not interrupt the process. When it finishes, your NetBoot client computer restarts automatically. The disk images have been copied to the client's folder.

Upgrade Mac OS

5. Upgrade Mac OS using the Installer. You may want to perform a custom installation because some Mac OS installers offer a custom installation of additional software for NetBoot clients. After the upgrade, the computer does not need to be restarted.

The next time the client starts up it downloads the old Mac OS ROM from the SharedImages folder on the server but attempts to start up with the new version of Mac OS.

If the client no longer starts up

6. Start up the client from the CD you used to upgrade Mac OS.

7. Log in to the NetBoot Server as an administrator using the Chooser.

8. Locate and open the SharedImages folder.

9. Rename the Mac OS ROM in the SharedImages folder; it may be needed later. (For example, name it "Mac OS ROM-Previous".)

10. Copy the Mac OS ROM file from the System Folder on the CD to the SharedImages folder.

11. Restart the client from the NetBoot server again.

Saving changes

12. After the client restarts, log in to the NetBoot server as an administrator.

13. Open NetBoot Desktop Admin, and click Save to save the new images. The system restarts and the disk images in the client's folder now have '+' appended to them.

If you had to do steps 6 through 10 again the computer may not restart. This is because the computer restarts from the original images, but the Mac OS ROM file has been upgraded.

If the computer does not restart again

14. Start up the client from the CD again.

15. Log in to the server as an administrator.

16. Locate and open the SharedImages folder.

17. Rename Mac OS ROM file; it may be needed later. (For example, name it "Mac OS ROM-New".)

18. Rename the Mac OS ROM file from step 9 back to "Mac OS ROM".

19. Restart the client from the NetBoot server.

Using the newly updated images

20. Log in to the server as an administrator.

21. Open NetBoot Desktop Admin.

22. Click Restart after choosing whether to save the previous images. This moves the images in the SharedImages folder, moves the images from the client's folder to SharedImages, and renames them properly.

23. Verify that the file named Mac OS ROM in the SharedImages folder is the correct version for the version of Mac OS just installed. You can do this by selecting the files and choosing Get Info from the Finder's File menu.

All clients should now start up using the updated images.

Macintosh: How to Reinstall Bugdom

This article explains how to reinstall Bugdom.

This article has been archived and is no longer updated by Apple.
Follow this procedure to reinstall Bugdom:

1. Insert your Restore CD into the computer.
2. Open the Configurations folder on the CD.
3. Open the restoration image file. For an iMac, the file is named iMac HD.img; for an iBook the file is named iBook HD.img.
4. After the licensing agreement and the checksum verification occur, an icon representing the contents of the image file appears on the desktop. Double-click to open it.
5. Open the Applications folder.
6. Locate the Bugdom folder.
7. Drag the entire Bugdom folder into the Applications folder on your hard disk.

You can now play Bugdom.

Apple DVD Player: Error 301

This article explains one reason why the Apple DVD Player application may not work properly when using an external CD-R or CD-RW drive on a computer with an internal DVD drive.
This article has been archived and is no longer updated by Apple.

Symptom

The following alert box appears after opening the Apple DVD Player program:

> "This Macintosh does not support the Apple DVD Player. Error number (301)."

Figure 1 Apple DVD Player alert box

Solution

1. Open the Extensions Manager control panel.
2. Turn off the Toast CD Reader extension by clicking its checkbox.
3. Restart the computer.

The CD-R/CD-RW drive is still operational with the Toast CD Reader extension disabled. If you also need to use the external drive as a CD-ROM reader, then you may need to turn on this extension and restart the computer.

For more information on error 301 with the Apple DVD Player program, please see article 25177: "**iMac (Summer 2000): Error 301 When Opening Apple DVD Player**"

Published Date: Feb 17, 2012

Power Mac G4 (Gigabit Ethernet): DVD-RAM Available Space Issue

When you insert and eject DVD-RAM disc from a Power Mac G4 (Gigabit Ethernet) computer, all subsequent DVD-RAM discs appear to have the same amount of free space available as the first disc.
This article has been archived and is no longer updated by Apple.

Symptom

After you eject a DVD-RAM disc, any other disc inserted prior to restarting the computer appears to have the same amount of free space available as the first disc. This also occurs between the two sides of a dual-sided DVD-RAM disc.

Warning: To prevent the potential for data loss caused by misreporting, follow the solution described here.

Solution

Note: Upgrading to Mac OS 9.1 resolves this issue. If you already use Mac OS 9.0.x, you may download the Mac OS 9.1 Update from Apple Software Updates (http://www.apple.com/swupdates).

Otherwise, when you need to switch between DVD-RAM discs or disc sides:

1. Eject the disc from the computer.
2. Restart the computer.
3. Insert the new disc or disc side.

WebObjects 4.5: Using Cookies With IIS Web Servers

Internet Information Server (IIS) Web servers handle cookies in a way that WebObjects 4.5 applications must accommodate. This article offers two solutions.

This article has been archived and is no longer updated by Apple.

Symptom

When running on an Internet Information Server (IIS) Web server, WebObjects 4.5 applications that set cookies cannot retrieve them later.

Solution

An IIS Web server modifies the standard Hypertext Transfer Protocol (HTTP) "Cookie" header to be "HTTP_COOKIE". A WebObjects 4.5 application, which looks for "Cookie" headers, is therefore unable to retrieve cookies. WebObjects 4.5 applications running through IIS must look for an "HTTP_COOKIE" header. There are two possible solutions:

Solution 1: Application Code

In the "Application" object dispatchRequest method, before you call super.dispatchRequest(), take the request object and read all the "HTTP_COOKIE" headers. Add a new header for each one, using "cookie" as the header key instead.

In Java, add this to Application.java:

```
public WOResponse dispatchRequest(WORequest aRequest) {
   NSArray isapiCookieHeaders = aRequest.headersForKey("HTTP_COOKIE");
   if (isapiCookieHeaders != null) {
       for (int i=0; i<isapiCookieHeaders.count(); i++)
           aRequest.setHeader((String)isapiCookieHeaders.objectAtIndex(i),
               "cookie");
       }

   return super.dispatchRequest(aRequest);
}
```

In Objective-C, add this to Application.m

```
(WOResponse*) dispatchRequest:(WORequest *) aRequest {
NSArray *isapiCookieHeaders = [aRequest headersForKey:@"HTTP_COOKIE"];
int i;
if (isapiCookieHeaders != nil) {
for (i = 0; i < [isapiCookieHeaders count]; i++)
[aRequest setHeader:[isapiCookieHeaders
objectAtIndex:i] forKey:@"cookie"];
}
return [super dispatchRequest:aRequest];
}
```

Solution 2: ISAPI Adaptor Code

There are no code changes to your WebObjects application, but it does require recompilation of the ISAPI adaptor.

In config.h, look for the following #define:

```
   #define COOKIE "cookie"
```

and change it to:

```
   #define COOKIE "HTTP_COOKIE"
```

Mac OS 9: Software Update Control Panel Lists Are Unreadable

When using the Software Update control panel to check for updated software, the list of updates returned doesn't appear to contain any text. Changing the view font and point size settings in the Appearance control panel resolves this issue.

This article has been archived and is no longer updated by Apple.

Symptom

When using the Software Update control panel to check for updated software, the list of updates returned doesn't appear to contain any text. See Figure 1.

Figure 1 Software Updates list with no visible text

Solution

The Software Update control panel uses the font and point size specified by the Appearance control panel to display list items. Using a large point size setting or an incompatible view font may cause this symptom. This is only a cosmetic issue; you can still use the Software Update control panel to download and install available updates.

You can change the font and point size used by the Software Update control panel by following these steps:

1. Open the Appearance control panel.
2. Click the Fonts tab.
3. Choose a font from the Views Font pop-up menu, and a point size from the adjacent Size pop-up menu. The default setting in Mac OS 9 is Geneva 10-point.
4. Close the Appearance control panel.

All applications that use the Appearance control panel settings, including the Software Update control panel, display the font and point size you specify.

Note: The update log available in Software Update control panel 1.2 may also contain text that is not visible because of font and size settings in the Appearance control panel. Follow the steps above to solve this issue.

Published Date: Feb 17, 2012

.Mac HomePage: QuickTime Movies Do Not Display Properly

This article outlines several things to check when a .Mac HomePage movie does not display properly in your Web browser.

This article has been archived and is no longer updated by Apple.

Symptom

A QuickTime movie on a HomePage iMovie Theater theme does not display properly in your Web browser.

Solution

There are several things to check, including:

Filename
Be sure the filenames of the movies stored in the Movies folder on your iDisk end with ".mov".

QuickTime Format
QuickTime movies must be in QuickTime 4.0 (or later) format. QuickTime movies exported from iMovie meet this criteria, but QuickTime movies from other applications may not. QuickTime Pro can convert some other media formats into QuickTime movies. For more information or to purchase QuickTime Pro, visit Apple's QuickTime site at http://www.apple.com/quicktime/ .

Web Browser
Be sure your Web browser is using the most recent version of the QuickTime plug-in. You can download the most recent version from Apple's QuickTime site at http://www.apple.com/quicktime/

Setup Assistant: Repeated Attempts to Transmit Registration Information

The Network Browser application program may display an item named "littlebuddy.apple.com" when Setup Assistant attempts to send your registration information to Apple. This article tells how to stop this behavior if it occurs repeatedly.

This article has been archived and is no longer updated by Apple.

Symptom

The Network Browser displays an item named "littlebuddy.apple.com". Network administrators using network traffic monitoring tools may see periodic traffic to this URL.

Products affected

- Setup Assistant
- Mac OS 9

Solution

1. Open the Extensions folder, which is inside your System folder.
2. Locate the file named "Setup Info Dispatcher" and drag it to the Trash.
3. Restart your computer.

The Setup Assistant application program, which is included with all new Macintosh computers, attempts to send your registration information through a secure Internet connection to an Apple product registration server. During this transmission, littlebuddy.apple.com may appear in the Network Browser. When the transmission has been received successfully by an Apple product registration server, it transmits an acknowledgement back to your computer.

If your computer does not receive acknowledgement, it attempts to send registration information again. This can occur repeatedly, for example, if your computer is behind a firewall that blocks the incoming acknowledgement from an Apple registration server. Dragging the Setup Info Dispatcher file to the Trash stops your computer from making any more attempts to send registration information.

Mac OS: "AppleGuideGlueLib" Cannot Be Found

Some applications require access to a code library named AppleGuideGlueLib, which is part of the Apple Guide system extension. If the Apple Guide system extension is turned off or not installed, the application cannot operate.

This article has been archived and is no longer updated by Apple.

Symptom

When opening an application program, an alert box appears with an error message that says:

"The application cannot be opened because 'AppleGuideGlueLib' cannot be found."

Products affected

- application programs
- control panels, such as the Mac OS 9.1 Monitors control panel

Solution

The Apple Guide system extension is turned off or not installed.

- If the Apple Guide system extension is turned off, use the Extensions Manager to turn on the Apple Guide system extension and then restart your computer.
- If the Apple Guide system extension is not installed, perform a custom installation of Mac OS Help from your original system software.

Published Date: Feb 17, 2012

Macintosh: Wake-on-LAN Packets Issue

In certain rare cases, a computer that wakes up by a wake-on-LAN packet may not properly return to sleep. It may wake up again, or stop responding.

This article has been archived and is no longer updated by Apple.

Symptom

There are two symptoms:

The computer wakes up by a wake-on-LAN packet and then goes to sleep, but immediately wakes up again.

The computer wakes up by a wake-on-LAN packet and if you change its TCP/IP setting to something other than Ethernet but don't access the network before the computer goes to sleep again, the computer stops responding ("freezes") after it goes to sleep.

Solution

Use one of these methods to avoid the issue:

- Disable "Wake for network administrative access" in the Energy Saver control panel.
- If TCP/IP is set to Ethernet, set AppleTalk to Ethernet as well.
- Access the network after the computer wakes up by a wake-on-LAN packet but before it goes to sleep again.

Notes

1. The parenthetical product description (Summer 2000) refers to the summer of the Northern Hemisphere.

USB Adapter Cards: Limited Functionality With Some Input Devices

Some USB keyboards connected to a PCI-based USB adapter card do not offer alternate keyboard layouts, nor the use of Easy Access software.

This article has been archived and is no longer updated by Apple.

Symptom

Alternate keyboard layouts, such as Dvorak and AZERTY, do not work with a USB keyboard that is connected to a USB adapter card.

*Includes the Macintosh Performa variations of these models.

Solution

The USB Adapter Card Read Me file notes that you may experience limited functionality using some USB input devices in certain applications, including Easy Access and the Keyboard control panel.

To use alternate keyboard layouts, or to use Easy Access, use an ADB keyboard with your computer.

For more information on the USB Adapter Card Support software, please see article 31132: "**USB Adapter Card Read Me Document and Software Download**"

Published Date: Feb 20, 2012

AppleWorks: Tips for Setup With Macintosh Manager

This article offers tips for setting up AppleWorks with Macintosh Manager.
This article has been archived and is no longer updated by Apple.
Here are some tips for setting up AppleWorks with Macintosh Manager:

AppleWorks 5

- If you see XTND errors when opening or saving as HTML, GIF, or JPG, install the Security Bypass extension if running Maciintosh Manager 1.3. If running Macintosh Manager 1.4, disable File Level Security for WorkGroups that contain AppleWorks. You may also need to delete the xtnd translator list file from the user's AppleWorks preferences. See article **88115** for additional information.

AppleWorks 5 and 6

- Documents that require DataViz MacLink Plus translators in order to open with AppleWorks may not open in AppleWorks when their icon is double-clicked, unless the Security Bypass extension is installed for Maciintosh Manager 1.3, or the Workgroup has file level security disabled for Maciintosh Manager 1.4. As an alternative, choose Open from the File menu of AppleWorks to open such documents.

AppleWorks 6

- Update to AppleWorks 6.1.2 - this update resolves many compatibility issues with Macintosh Manager, resolving issues with Recent Items, Web Starting Points, and eliminates the need to use Security Bypass and the Other Applications folder.

Published Date: Feb 19, 2012

Mac OS 9: Brief Delay When Desktop First Appears

If you have set up your computer to automatically open a file server volume at system startup time, or have an alias of your hard disk in the Apple Menu Items folder, there may be a brief delay when the desktop first appears.

This article has been archived and is no longer updated by Apple.

Symptom

At system startup time, when the desktop first appears, the Finder appears to "freeze" for a brief period. For example, you cannot open a menu from the menu bar.

Solution

There are two reasons this may occur: if an alias of the hard disk is put into the Apple Menu items, or if a file server volume is opening at startup time.

Alias of Hard Disk in Apple Menu Items

If an alias of the hard disk is placed in the Apple Menu Items folder, the Finder must index the hard disk and build the menu for every item it finds. This can take a long time depending on the number of items and directory structure of the hard disk.

To prevent the delay at startup time, remove the hard disk alias.

File Server Opens at Startup Time

The brief delay may occur while the computer is attempting to connect to the file server volume(s) that you have chosen to automatically open at system startup time. Turning off this feature eliminates the brief delay.

If the server volume is available on the network, follow this procedure to no longer have it opened automatically at system startup time:

1. Connect to the network.
2. Open the Chooser.
3. Click the AppleShare icon to select it.
4. Log on to the AppleShare file server containing the volume(s) you no longer wish to open at system startup time.
5. Click the appropriate checkbox to deselect the volume(s) you no longer wish to open at system startup time (see Figure 1).
6. Click OK.
7. Close the Chooser.

Figure 1 The checked volume will open automatically at system startup time

If the server volume is not available on the network, follow this procedure to no longer have it opened automatically at system startup time:

1. Open your computer's startup disk.
2. Open the System Folder.
3. Open the Servers folder.
4. Locate the alias(es) of the file server volume(s) you no longer wish to open at system startup time.
5. Drag the alias(es) to the Trash.

Network Assistant 4.0.x: Some AppleWorks 6 Items Do Not Appear on Shared Screens

Some AppleWorks 6 items do not appear on client screens when sharing screens with Network Assistant. Changing the screen sharing preference resolves the issue.

This article has been archived and is no longer updated by Apple.

Symptom

When sharing a screen through Network Assistant, some AppleWorks 6 items do not appear on client screens. For example, thumbnails in the Starting Points window, QuickTime movies, and AppleWorks presentations.

Solution

Follow these steps to set up screen sharing so that all screen changes are displayed:

1. Open the Network Assistant application program.
2. Choose Preferences from the Setup menu; the Preferences dialog box appears (see Figure 1).

Figure 1 Network Assistant Preferences

3. Set the screen sharing preference to "Send all screen changes (requires Ethernet)."
4. Click OK.
5. Quit Network Assistant.

Mac OS 9: Command-Shift-0 Puts System to Sleep

Command-Shift-0 cannot be used as a keyboard shortcut by applications with Mac OS 9. This keyboard shortcut puts the system to sleep.

This article has been archived and is no longer updated by Apple.

Symptom

If you attempt to use Command-Shift-0 (zero) as a keyboard shortcut within an application program, the system goes to sleep.

Solution

Do not use Command-Shift-0 as a keyboard shortcut. If there is a menu item for the command, use it instead. Alternatively, you may be able to use Command-Shift-0 with the zero key on numeric keypad; some applications recognize this sequence.

Command-Shift-0 is used by Mac OS 9 as a keyboard shortcut to put the system to sleep. The command is intercepted by Mac OS 9 and processed; it is never sent to the application.

Command-Shift-number key sequences are reserved for system use. Prior to Mac OS 9, Command-Shift-0 was used by PowerBook computers as a keyboard shortcut to put the system to sleep. Mac OS 9 brings this feature to desktop Macintosh computers, too. Apple developer documentation has noted the following for many years:

"You shouldn't assign a Command-Shift-number key sequence to a menu item as its keyboard equivalent; Command-Shift-number key sequences are reserved for use as 'FKEY' resources. Command-Shift-number key sequences are not returned to your application, but instead are processed by the Event Manager. The Event Manager invokes the 'FKEY' resource with a resource ID that corresponds to the number that activates it."

iMac: Modem Extension Required for Dialing With Remote Access

If the proper modem extension is not installed and turned on, Remote Access cannot dial the modem and the Modem control panel does not show an available serial port.

This article has been archived and is no longer updated by Apple.

Symptom

When attempting to use your computer's modem to make a connection through Remote Access, the following error message is displayed: "The connection attempt failed: An unexpected Open Transport error occurred." Additionally, the Modem control panel does not show an available serial port in its "Connect via" area.

Solution

Use the Extensions Manager to make sure the appropriate modem extension is installed and turned on:

Computer	Extension
iMac	iMac Modem Extension
iMac (Slot loading)	Internal V.90 Modem
iMac (Summer 2000)	Internal V.90 Modem

If the extension is turned off, turn it on and restart the computer.

If the extension is not installed, (re)install the Mac OS 9 Update, which updates Mac OS to version 9.0.4.

If you choose not to install Mac OS 9 Update, you can perform a custom installation of the modem software from the iMac Software Install CD.

For related information on this topic, please see the following articles:

Document 50055: "**Miscellaneous Manuals**" Troubleshooting Handbook.

Published Date: Feb 20, 2012

Mac OS 9: Delay in Audio Play-Through

Mac OS 9 introduces audio routing capabilities to accommodate digital audio devices such as USB speakers and microphones. Routing of the input audio signal to the current output audio devices introduces a small amount of latency. This happens only when "Play sound through output device" is selected for that input source in the Sound control panel.

This article has been archived and is no longer updated by Apple.

Symptom

There is a slight delay in sound output. For example, if you are talking through a PlainTalk microphone and "Play sound through output device" is selected in the Sound control panel, your voice may sound like an echo coming through the speakers.

Solution

Turn off "Play sound through output device" in the Sound control panel to eliminate this effect.

In most cases, playing the audio through to the speakers is not necessary. If you need to monitor the input source, monitor it at the source device (with a headphone jack) or with an audio mixer instead of using the computer's audio output.

Note: The parenthetical product description (Summer 2000) refers to the summer of the Northern Hemisphere.

QuickTime for Macintosh: How to determine which edition and version is installed

This article has been archived and is no longer updated by Apple.

Learn how to determine which edition and version, such as Pro Player, of QuickTime is installed on your Macintosh computer.

For Windows-compatible computers, see "QuickTime for Windows: How to Determine Which Edition and Version Is Installed."

How to determine which edition and version is installed

Mac OS X

The steps depend on whether you have QuickTime 6 or QuickTime 7 installed.

QuickTime 7

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **QuickTime**. The QuickTime pane appears.
3. Click Register. If there is a QuickTime Pro key entered, you'll see the registration information and QuickTime 7 Pro will display below the registration number:

QuickTime 7 Pro is installed here. To find the specific version of QuickTime, click About QuickTime to see the installed version:

QuickTime 7.0.2 is installed here.

QuickTime 6

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **QuickTime**. The QuickTime pane appears.
3. Click Registration. A sheet appears with the edition. The field named QuickTime indicates which edition of QuickTime is installed.

QuickTime 6 Pro is installed. To find the specific version, click Cancel to close the registration screen and then click About QuickTime. A sheet appears that displays the installed version number of QuickTime.

QuickTime version 6.5.1 is installed here.

Mac OS 9

1. Open the QuickTime Settings control panel.
2. Choose Registration from the pop-up menu.

TA22179_QuickTime_for_Macintosh_How_to_determine_which_edition_and_version_is_insta

The field named QuickTime Key indicates which edition of QuickTime is installed.

QuickTime 5 Pro is installed here. To find the specific version of QuickTime that is installed, choose About QuickTime from the pop-up menu. The version number appears below the pop-up menu.

QuickTime version 5.0.1 is installed here.

Upgrading to QuickTime Pro

For information on upgrading to QuickTime Pro, visit the QuickTime web site.

For information on the differences between QuickTime and QuickTime Pro, see "Differences Between QuickTime and QuickTime Pro"

Published Date: Feb 20, 2012

Power Mac G4: Connecting Additional Displays

This document explains how to connect additional displays to a Power Mac G4 computer.
This article has been archived and is no longer updated by Apple.

Power Mac G4

The Power Mac G4 display card can accommodate one display at a time, regardless if it has one or two connectors on it. Depending upon the card installed, the display can use a VGA-, DVI-, or ADC-style connector. Refer to technical document 58692: "**Power Mac G4: Display Compatibility**" for images of the connectors.

To connect additional displays, install an additional PCI display card. Be sure the card and display have matching connectors.
This includes the following models:

- Power Mac G4 (PCI Graphics)
- Power Mac G4 (AGP Graphics)
- Power Mac G4 (Gigabit Ethernet)
- Power Mac G4 (Digital Audio)

Power Mac G4 (QuickSilver)

You can simultaneously connect two displays to Power Mac G4 (QuickSilver) computers that have the optional nVidia GeForce2 MX TwinView video card installed. **Important:** This card has two connectors: one VGA monitor and one Apple Display Connector (ADC) display port. Be sure the displays match the connectors.

To connect additional displays, install an additional PCI display card. Be sure the card and display have matching connectors.

Power Mac G4 (QuickSIlver 2002)

You can simultaneously connect two displays to Power Mac G4 (QuickSilver 2002) computers that have either the nVidia GeForce4 MX or the ATI Radeon 7500 video cards installed. **Important:** Both of these cards have two connectors: one VGA monitor and one Apple Display Connector (ADC) display port. Be sure the displays match the connectors.

To connect additional displays, install an additional PCI display card. Be sure the card and display have matching connectors.

Power Mac G4 Cube

Only one display, with either a VGA- or ADC-style connector, can be connected to a Power Mac G4 Cube computer.

See technical document 58418 "**Power Mac G4: How to Differentiate Between Models**" if you are unsure which Power Mac G4 you have.

QuickTime Pro: How to Enter the Registration Key Under Mac OS 9

This article explains how to enter the QuickTime Pro registration key.

This article has been archived and is no longer updated by Apple.

The QuickTime Pro key unlocks the professional features of the current version of the free QuickTime Player. To obtain the latest version of QuickTime or to purchase a QuickTime Pro key, see the QuickTime website (**http://www.apple.com/quicktime**).

Note: See technical document 31335 "**QuickTime: Not All Keys Enable Pro Features**" for information on if your key will work with the current version of QuickTime.

Follow these steps to enter your QuickTime Pro registration key:

1. Open the QuickTime Settings control panel.
2. Choose Registration from the pop-up menu (see Figure 1).

Figure 1 Pop-up menu

3. Click Enter Registration; a dialog box appears (see Figure 2).

Figure 2 Registration dialog box

4. Enter the name and registration number exactly as they appear on your Confirmation of QuickTime Pro Upgrade message.

When entering the name, do not enter a nickname, abbreviated name, or anything other than the name as it appears on your Confirmation of QuickTime Pro Upgrade message.

The QuickTime Pro registration number consists of five sets of characters, each separated by a hyphen (see Figure 2). You must include the hyphens when entering the QuickTime Pro registration number. If the name or registration number are not entered exactly, an alert box appears (see Figure 3).

Figure 3 Alert box

For related information on this topic, please see the following articles:

Article 25227: "**QuickTime Pro for Windows: How to Enter the Registration Key**"
Article 42564: "**QuickTime Pro: How to Enter the Registration Key Under Mac OS X.**"

QuickTime software can be found at:

http://www.apple.com/quicktime/

Published Date: Oct 10, 2016

QuickTime Pro for Windows: How to Enter the Registration Key

This article explains how to enter the QuickTime Pro for Windows registration key.

This article has been archived and is no longer updated by Apple.

The QuickTime Pro key unlocks the professional features of the current version of the free QuickTime Player. To obtain the latest version of QuickTime for Windows or to purchase a QuickTime Pro for Windows key, see the QuickTime website (**http://www.apple.com/quicktime**).

Note: See technical document 31335 "**QuickTime: Not All Keys Enable Pro Features**" for information on if your key will work with the current version of QuickTime.

Follow these steps to enter your QuickTime Pro for Windows registration key:

1. Click the Start menu, then choose Control Panel (see Figure 1).

Figure 1 Opening the Control Panel window

2. Click Other Control Panel Options (See Figure 2).

Figure 2 Opening the Other Control Panel Options window

3. Open the control panel named QuickTime (see Figure 3).

Figure 3 QuickTime control panel

4. Click Enter Registration; a dialog box appears (see Figure 4).

Figure 4 Registration dialog box

5. Enter the name and registration number exactly as they appear on your Confirmation of QuickTime Pro Upgrade message.

When entering the name, do not enter a nickname, abbreviated name, or anything other than the name as it appears on your Confirmation of QuickTime Pro Upgrade message.

The QuickTime Pro registration number consists of five sets of characters, each separated by a hyphen (see Figure 3). You must include the hyphens when entering the QuickTime Pro registration number. If the name or registration number are not entered exactly, an alert box appears (see Figure 5).

Figure 5 Alert box

Macintosh Manager 1.3: Setting Up and Using a FireWire Drive

This article tells how to set up and use a FireWire hard disk drive with Macintosh Manager 1.3.

This article has been archived and is no longer updated by Apple.
Four areas must be considered when setting up a FireWire disk drive for use with Macintosh Manager 1.3:

- Admin setup
- Client setup
- How to connect to a FireWire volume
- Privileges

Additionally, this article tells what to do if a user encounters difficulty saving documents to a particular folder.

Admin Setup

A FireWire hard drive is treated as removable media by Macintosh Manager 1.3. To connect to a FireWire (IEEE 1394) hard drive volume the workgroup must have at least Read only access to removable media. Follow these steps to set up privileges for removable media:

1. Open the Macintosh Manager administration program.
2. Connect to a Macintosh Manager server; a window appears.
3. Click the Workgroups tab in the window.
4. Select the workgroup for which you want to set privileges.
5. Click the Privileges tab.
6. Use the pop-up menu titled "Removable Media (except CDs)" to set privileges. (If privileges are set to Disabled, workgroup members cannot use FireWire drives and media.)

Client Setup

The client computer(s) must have the appropriate driver software installed for the FireWire drive.

Connecting to a FireWire Volume on a Client

1. Make sure the FireWire drive is disconnected from the client computer.
2. Log in from a client computer.
3. When the log-in process has completely finished, connect the FireWire drive.

If you encounter difficulty, log out and start over at step 1.

Disconnecting a FireWire Drive on a Client

1. Put away the FireWire drive volume by selecting it on the desktop and choosing Put Away from the File menu, or by dragging the volume's icon to the Trash.
2. Disconnect the FireWire drive.

All removable media are put away automatically when a user logs out from Macintosh Manager, so a FireWire drive can safely be disconnected when the login screen reappears.

Privileges Issue

The removable media access privileges assigned to a workgroup apply to the entire volume for every member of the workgroup. Even though individual user folders are created on the volume, all members of the workgroup have equal access to the entire contents of the removable media volume. For example, a user in a workgroup that has read only privileges for removable media has read only access to all folders on a removable media volume.

Difficulty Saving to a Specific Folder

If you encounter difficulty saving documents to a particular folder on a FireWire drive, and you know you have read and write privileges for removable media, delete the folder and create a new one. Follow these steps to delete the folder and create a new one:

1. Log in as a user who has system access.
2. Temporarily move all files out of the faulty folder, then delete the folder.
3. Log out.
4. Log in as the user to whom the folder will belong.
5. Create a new folder.
6. Move the files that were in the faulty folder into the newly-created folder.
7. Log out.

QuickTime Player: Accessing Special Editing Commands

This article explains how to access the following QuickTime Pro editing commands available in the QuickTime Player application: Replace, Add, Add Scaled, and Trim. These commands are available only if QuickTime Pro is installed.

This article has been archived and is no longer updated by Apple.

The special QuickTime Pro editing commands available in QuickTime Player are accessed through the Edit menu. With a movie open in QuickTime Player, hold down the key(s) indicated in Figures 1, 2, or 3, open the Edit menu, and choose the command.

Figure 1 Add and Trim
Mac OS keystroke Option
Windows keystrokes Ctrl-Alt

Figure 2 Replace
Mac OS keystroke Shift
Windows keystroke Shift

Figure 3 Add Scaled and Trim
Mac OS keystrokes Option-Shift
Windows keystrokes Ctrl-Alt-Shift

The Selection Start and Selection End markers (Figure 4) are used with all of these editing commands.

Figure 4 QuickTime Player Selection Start and Selection End markers

For more help with QuickTime Player, open its Help menu and choose On-line QuickTime Player Help.

For information on upgrading to QuickTime Pro, visit the QuickTime Web site at http://www.apple.com/quicktime/

Final Cut Pro 1.2.5: "Late Breaking News" Items

This article contains the "Late Breaking News" items for Final Cut Pro 1.2.5 that were published when the software was released. These items apply to Final Cut Pro version 1.2.5 and earlier.

This article has been archived and is no longer updated by Apple.

Aborting a batch capture after updating files

If you update a project from earlier versions of Final Cut Pro, do a batch capture or recapture of these clips, and then abort the capture, clip icons may change from offline video clips to offline audio clips. This does not affect the clips. To correctly capture the clips, restart the batch process.

Exporting a still image several times

If you export a still image more than two times without changing the filename, the export fails the third time and nothing happens. The first time you export a still image using default settings, the exported file has the name you entered. If you export this file a second time without changing the filename, a file is created with the same name followed by ".1". To export an image more than two times, make sure you change the filename each time before exporting.

Exporting DV NTSC to DV PAL and vice versa

If you want to export digital video from NTSC format to PAL format or from PAL format to NTSC format, you must use professional conversion equipment to get good results. Converting video formats using the computer will give unsatisfactory results and is not recommended.

Opening projects encrypted using Mac OS 9

Project files that have been encrypted with the Apple File Security feature of Mac OS 9 must be decrypted before you can use them in Final Cut Pro. If you try to open an encrypted project file, a message says your computer was unable to open the project file. To open the encrypted project, quit Final Cut Pro, then double-click the encrypted project's icon. Follow the onscreen instructions to decrypt the project file.

Getting dropped frames with video mirroring on

If you're using Final Cut Pro on a computer with video mirroring turned on in the Monitors control panel, frames may be dropped during playback. For the best performance, turn off video mirroring on your computer. For more information, see Mac Help.

Using more resolutions on an Apple 15-inch or 17-inch Studio Display

If your resolution settings are limited to 640 by 480 when using the Apple 15-inch or 17-inch Studio Display, you can get additional resolutions by turning off the Data Display Channel (DDC) control using the on-screen display (OSD) feature of your display. To do this, follow these steps:

1. Press the OSD Enter button on the left of the monitor; the Basic Adjustments menu appears.
2. Choose the ETC icon and press the Enter button.
3. Choose Off to turn off DDC.
4. Press the OSD Exit button.

Using a Pinnacle TARGA series card with an Apple 17-inch Studio Display

When you use a Pinnacle TARGA series card with an Apple 17-inch Studio Display, the monitor displays in all green. For the monitor to display correctly, you must use the small black adapter cable that comes with the Pinnacle video card.

To connect the adapter cable, follow these steps:

1. Turn off your computer and monitor.

2. Connect one end of the adapter cable to the video card port on the computer, then connect the other end to the monitor cable.

3. Turn on your computer and monitor.

Colors should now display properly.

Using a Sony DVMC-DA1 or DVMC-DA2 converter box

The Sony DVMC-DA1 or newer converter box does not provide FireWire or any other form of device control. It only converts analog video and audio signals to DV, which can then be transmitted over FireWire.

If you are using this converter box with a video device that supports serial device control, such as RS-422, set the supported device control protocol. Choose Preferences from the Edit menu, click the Device Control tab, then choose a setting from the Protocol pop-up menu.

Make sure you do not select FireWire device control (do not choose a FireWire option from the Protocol menu). If you select FireWire device control, frames will be dropped.

If your analog video device does not support device control, turn off device control. To do this, choose Preferences from the Edit menu, click the Device Control tab, then make sure the checkbox next to Enable Device Control doesn't have a checkmark in it.

Two audio capture rates are available for this box, 32 kHz and 48 kHz. To choose one, hold down the DV In button on the top of the unit. The light on the unit changes between green and red; green indicates a 32 kHz sample rate and red indicates a 48 kHz sample rate.

Using a Hammer SCSI card

If you install the HammerTime extension that comes with a Hammer SCSI card, the extension interferes with QuickTime and playing video is erratic and may cause your system to stop responding ("freeze"). If you have already installed the extension, delete it, then restart your computer. For more information, contact the card's manufacturer.

No communication with a DV device

If you are having trouble communicating with your DV camera, shut down your computer and turn off your camera. Wait a few minutes, then turn on your computer and the camera. Device control is not available when your camcorder is in Camera mode.

Disable disk monitoring utilities

For best performance, do not use disk monitoring software, such as Symantec's DiskLight, while using Final Cut Pro.

Open video clips in one application only

Do not open a video clip in multiple applications at the same time. A DV file playing in Final Cut Pro while simultaneously open in Movie Player does not play back properly. and may cause your clips to be marked "offline."

Apple Pro Speakers: Compared to Power Mac G4 Cube Speakers

This article has been archived and is no longer updated by Apple.

Although the Apple Pro Speakers look very similar to the speakers that come with the Power Mac G4 Cube computer, they are functionally very different. The table below outlines these differences.

Characteristic	Apple Pro Speakers	Power Mac G4 Cube Speakers
Power Source	Apple Speaker sound output port	USB
Sound Connection	Apple Speaker sound output port	USB
Harmon Kardon iSub	compatible	compatible with Mac OS X 10.1 or later

The Apple Pro Speakers cannot be used with any computer that does not have an Apple Speaker sound output port. The following computers have an Apple Speaker sound output port:

- Power Mac G4 (Digital Audio)
- Power Mac G4 (QuickSilver)
- Power Mac G4 (QuickSilver 2002)
- Power Mac G4 (Mirrored Drive Doors)
- Power Mac G4 (FW 800)

- iMac (Flat Panel)
- iMac (17-inch Flat Panel)
- iMac (1GHz Flat Panel)
- iMac (USB 2.0)

Refer to article 58764 "**Power Mac G4 (Digital Audio) and (QuickSilver): Sound Output Ports**" for more information about the sound capabilities of the Power Mac G4 (Digital Audio) and Power Mac G4 (QuickSilver) computers.

For information on how to differentiate between Power Mac G4 models, refer to article 58418: "**Power Mac G4: How to Differentiate Between Models**."

Macintosh Manager 1.3, AppleShare IP 6.3.x: Setting up Workgroup Items on Local or Server Volumes

The "About AppleShare IP/9.0.4 Update" and "About AppleShare IP 6.3.3" documents inadvertently suggest that all items for all workgroups must be stored only on clients' local volumes when setting up Macintosh Manager 1.3 with an AppleShare 6.3.x server.
This article has been archived and is no longer updated by Apple.
The documents contain statements suggesting that items for all workgroups should be found and stored on clients' local volumes. This may create an impression that this is the only way Macintosh Manager can be set up. The suggestion was presented in the interest of reducing network traffic from applications that are not required to operate from a server.

Ideally, applications that are designed for use on a client computer's local disk (volume) should be used in that way to reduce unnecessary traffic. However, applications that must reside on a server volume--or that are designed to be used from a server volume--may still be used in that manner.

If an application must be stored on an AppleShare 6.3.x server, Macintosh Manager 1.3 can be set up appropriately. Here are some recommendations:

- Avoid using Macintosh Manager Admin on the Macintosh Manager server. Instead, open the Macintosh Manager Admin program on a computer set up like those of your clients. If Workgroup Items are appropriately added, the client workstations will be less likely to search the server inappropriately for items that exist locally, resulting in less network traffic.
- Add the server-based applications (using the Macintosh Manager Admin program) from the server volume the client workstations use, rather than from a local volume on the admin system.
- Add local applications from a local volume on the Macintosh Management admin system.

If these recommendations are followed, the most appropriate setting for "Find Chosen Items" is "on item's original volume only".

USB: High Bandwidth and Isochronous Devices Must Be Separated

Two high-bandwidth devices or two isochronous devices cannot be connected to a single Universal Serial Bus (USB).

This article has been archived and is no longer updated by Apple.

Symptom

When connected to the same bus, certain combinations of USB devices experience intermittent difficulties, or do not work at all. If one of the devices is disconnected or moved to another USB bus, everything works properly

Solution

Connect only one high bandwidth or isochronous USB device to each USB bus.

If your computer has a single USB bus, adding a USB interface card provides a second USB bus. Without a second USB bus, you may have to completely disconnect one high bandwidth or isochronous USB device in order to utilize another.

In general, two high bandwidth devices cannot share the same USB bus. Each USB bus has a maximum bandwidth of 12 Mbits/s. A USB device can request up to 6 Mbits/s of bandwidth. Depending on how they operate, high bandwidth devices may compete with each other and therefore may need to be placed on separate USB busses to work properly.

Isochronous devices cannot be shared on a single bus. USB supports isochronous devices, which can be high or low bandwidth. Examples of common isochronous devices include cameras and CD-R drives.

Macintosh starts up to Open Firmware or gray screen after upgrading hard drive

If you upgrade your Macintosh computer from its original hard drive to a new hard drive that is larger than 8 GB, you may see some odd symptoms, such as one of these:

This article has been archived and is no longer updated by Apple.

- When the computer starts up, it displays a gray screen. The desktop never appears.
- When the computer starts up, it shows a white screen, with text that includes the phrases, "Open Firmware" and "default catch".
- When the computer starts up, you may see an alert message such as "unimplemented trap" or "segment loader error".
- When you try to install Mac OS X on the computer, the hard disk is dim and can't be selected in the installer.

This only happens with certain Macintosh computers that originally had a hard drive smaller than 8 GB, and that have now been upgraded with a hard drive larger than 8 GB. These computers include:

  - iMac 233 MHz
  - iMac 266 MHz
  - iMac 333 MHz
  - Power Macintosh G3 Desktop
  - Power Macintosh G3 Mini Tower
  - Power Macintosh G3 All-In-One
  - iBook
  - iBook (FireWire)
  - PowerBook G3 Series

If you have just upgraded the hard drive on one of the computers listed above and you see this issue occurring, here's how to get everything running smoothly again:

1. Back up all your data. (This is a good thing to do regularly, not just now!)
2. Start up from your Mac OS installation or restore disc.
3. Use Drive Setup (in Mac OS 8 or 9) or Disk Utility (Mac OS X) to partition the drive. Make the first partition smaller than 8 GB, and any other partitions can be any size you want.
4. Install the Mac OS in the first drive partition.

Power Mac G4: Video Driver Selected At System Startup Time

The Power Mac G4 (Digital Audio) and Power Mac G4 Cube computers both have two different sets of video card driver software installed--NVIDIA and ATI. When the computer starts up, only the appropriate video driver software is loaded. If an NVIDIA video card is installed, the ATI video card driver software is not loaded, and an icon with a red X through it is displayed. This is normal.

This article has been archived and is no longer updated by Apple.

Symptom

When the computer starts up, an icon with a red X through it appears on the screen. See Figure 1.

Figure 1 ATI driver not loaded

Solution

There is nothing wrong; the computer is functioning normally.

The video card driver software for two different video cards--NVIDIA and ATI--are installed in the System Folder of Power Mac G4 (Digital Audio) and Power Mac G4 Cube computers. When the computer is turned on, it detects which card is installed and loads its driver software. If the ATI driver software is not needed, an icon with a red X through it appears at system startup time. If the NVIDIA driver software is not needed, its icon does not appear. Each of these behaviors is normal.

If the computer does not have an ATI video card, and you do not want to see its icon during startup, use the Extensions Manager control panel to turn off the ATI Graphics Accelerator extension.

Published Date: Oct 10, 2016

Mac OS X: Font file formats

This article has been archived and is no longer updated by Apple.

Mac OS X introduces a new font format and adds support for certain font formats used by Microsoft Windows. This article discusses the formats and the implications for users.

Data Fork Suitcase Format

One of the innovations offered by Mac OS X is that font suitcases can be completely stored in a file's data fork. All of the resource fork's data is stored in the data fork, which allows more efficient access to font data as well as the ability to copy font suitcases to and from file systems that do not recognize resource forks.

The data fork suitcase format is different from the data fork TrueType font format used by Microsoft Windows. Data fork suitcases contain all of the resources associated with a Macintosh font, including 'FOND' and 'NFNT' resources, which are used with QuickDraw Text.

Data fork suitcases must have the filename extension ".dfont." They may optionally be given the file type "dfon."

Microsoft Windows Font Formats

Mac OS X also works with font formats used by Microsoft Windows. These fonts have all their data in the data fork and do not have the additional resources found in Macintosh fonts. Mac OS X works with these font formats:

- TrueType fonts (with the extension .ttf)
- TrueType collections (with the extension .ttc)
- OpenType fonts (with the extension .otf)

Older Macintosh Fonts

Font suitcases used by Mac OS 9 and earlier that contain TrueType fonts continue to work with Mac OS X. No revision or conversion is necessary. Font suitcases containing only bitmap fonts will be available in Classic applications but not in Mac OS X applications.

Additional information

(The following information is from the Mac OS X 10.3: Fonts Technology Brief.)

Mac OS X delivers industry-leading support for popular font formats:

- PostScript Type 1 (with double-byte support). Adobe PostScript fonts launched the desktop publishing industry and are used today by publishers, corporations, and government agencies for high-quality output to laser printers, imagesetters, and platesetters. Each PostScript font requires two files, one for the screen and one for use by the printer's RIP (raster image processor). Mac OS X is the only operating system that provides native PostScript Type 1 font support.
- OpenType. OpenType fonts (extension .otf) can contain 65,000 different glyphs, so type can be set in non-Roman languages such as Japanese, Chinese, and Korean. There are Macintosh- and Windows-specific OpenType formats; Mac OS X supports both.
- TrueType. TrueType fonts (extension .ttf) are typically used in home and office environments. A single file contains both screen and printer font information. Mac OS X supports both Macintosh- and Windows-specific TrueType formats.
- Multiple Master. This special type of PostScript font allows variation of one or more font parameters (such as weight) to create a large number of custom styles, also known as instances. Mac OS X can activate already created instances of Multiple Master fonts.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS 9.1: Cannot Install Apple DVD Player 2.2

Apple DVD Player 2.2 software cannot be installed on a computer when Mac OS 9.1 is already installed. This article explains how to install Apple DVD Player software onto a computer with Mac OS 9.1.
This article has been archived and is no longer updated by Apple.

Symptom

When installing Apple DVD Player 2.2 software on a computer with Mac OS 9.1, an alert box appears with the following error message:

> "Apple DVD player cannot be installed onto a volume which does not contain a US, British, or International English release of Mac OS 9.0.1 or newer."

Solution

Note: Updated versions of Apple DVD Player currently address this issue. See article 26201 to download Apple DVD Player 2.4 or article 120022 to download Apple DVD Player 2.7.

If the computer came with Apple DVD Player 2.3 or later, you must install (or reinstall) that version. Use the Software Installers disc that came with your computer to perform this custom installation.

If the computer did not come with Apple DVD Player 2.3 or later, and you upgraded to Mac OS 9.1 by buying the Mac OS 9.1 CD, use the Mac OS 9.1 CD to perform a custom installation of Apple DVD Player 2.3 off the Mac OS 9.1 CD.

If neither of the solutions are applicable to your situation, then follow these steps:

1. Perform a clean installation of Mac OS 9.0.x.
2. Install Apple DVD Player 2.2.
3. Install the Mac OS 9.1 update.

If you have updated to Mac OS 9.1 using the free download version and are experiencing this issue, please see article 60803: "**Apple DVD Player 2.0: Not Compatible with Mac OS 9.1**"

Power Mac G4 (Gigabit Ethernet): DVD-RAM Drive Audio Channels Reversed

This article explains how to check and correct reversed audio channels for the DVD-RAM drive in a Power Mac G4 (Gigabit Ethernet) computer.

This article has been archived and is no longer updated by Apple.

Symptom

The left and right audio channels are reversed.

Solution

Follow these steps to check and correct the issue:

1. Make sure the speakers are in the correct left and right positions.
2. If you are creating audio, make sure the software is sending the audio to the correct channel(s).
3. If the symptom still persists, one of these actions will resolve it:
   - Switch the position of the left and right speakers.
   - Replace the DVD-RAM drive. Contact Apple Support for assistance with replacing the drive.

Published Date: Oct 10, 2016

Apple Pro Keyboard: USB Device Extension Software

The Apple Pro Keyboard is not recognized by the computer if its extension, "USB Device Extension", is missing or turned off.

This article has been archived and is no longer updated by Apple.

Symptom

When the computer starts up, an alert box with this message appears:

> "Software needed for the USB device 'Apple Extended USB Keyboard' is not available. Would you like to look for the software on the Internet?"

Solution

One of these actions will resolve the situation:

- Use the Extensions Manager control panel to verify that the extension named "USB Device Extension" is turned on. If it is off, turn it on and restart the computer.
- If USB Device Extension is not in the Extensions folder, use Sherlock to find it. Drag the file into the Extensions folder.
- If USB Device Extension is not on the hard disk, install it by performing a custom installation from the Software Install disc. (The USB Device Extension software is an item within the system software's Network & Connectivity component.) For more information on custom installation of Mac OS 9 components, please see article 31288: "**Mac OS 9: Installing or Removing Individual Components**."

Note: The USB Device Extension adds the additional functionality of the new keys: volume up, volume down, mute, and the media eject keys. The rest of the keyboard will function normally without the extension.

Starting up with Extensions Disabled will still allow you to use the keyboard as basic keyboard functionality is built into the Mac OS ROM File. However, all function keys and extended keys will loose functionality.

AppleWorks 6: Troubleshooting Web Connections

If the icons in the Web tab of the AppleWorks 6 Starting Points window appear as generic icons (with or without a red X through them), there are several things to check.

This article has been archived and is no longer updated by Apple.

One of these two symptoms occurs:

- The icons in the Web tab of the Starting Points window appear as generic white icons. Nothing happens when you click them.

Starting Points icons

- The icons in the Web tab of the Starting Points window appear as generic white icons for a period of time ranging from several seconds to 45 seconds, and then appear with a red X through them. Nothing happens when you click them.

Starting Points icons with red X

If the first symptom occurs (generic white icons that do not change appearance), read "**AppleWorks 6: Generic White Icons in Web Starting Points**"

If the second symptom occurs (generic icons whose initial appearance changes to that shown in Figure 2), it indicates that AppleWorks is unable to access Web-based content. There are several things to check:

AOL Users

You should first read "**AppleWorks 6: AOL Users Must First Connect to Internet to Use Web Clippings**". If the symptom still exists, continue reading this article.

Server Is Busy

If the computer's connection to the Internet does not pass through a proxy server, and the computer is able to connect to the Internet with other applications, it may indicate that the AppleWorks server is busy. Try accessing the AppleWorks Web-based content at various times to determine whether this is the case.

Proxy Server

If the computer's connection to the Internet passes through a proxy server, check the Firewall settings in the Internet control panel. Follow these steps:

1. Open the Internet control panel.
2. Choose User Mode from the Edit menu, click Advanced, and then click OK.
3. If the Settings tabs are not visible within the Internet control panel window, click the Edit Sets disclosure triangle to reveal them.
4. Click the Advanced tab.
5. Select the Firewalls icon from the scrolling list.
6. Select the Web Proxy server option by clicking its checkbox, and enter the Web Proxy server name and port number. (See your network administrator for the proxy server name and port number.)
7. Close the Internet control panel window; when asked to save changes, click Save.

If the computer is still unable to connect through the proxy server, repeat steps 1 through 5 and enter the following into the Bypass Proxy Servers list:

```
awpicts.apple.com
```

AppleWorks 6: How to Create Labels

Learn how to create labels using AppleWorks 6.

This article has been archived and is no longer updated by Apple.

To create labels, you must use the Label Layout which is available only in an AppleWorks database document. You can use either an existing database, or the Address List Assistant to create an address database.

Address Assistant

With your database document open, follow these steps to create a label layout:

Step One

Choose New Layout from the Layout menu or the layout pop-up menu located on the left side of the document window.

New Layout Menu

Tip: The easiest way to create a Labels layout is to choose New Label Layout from the Layout menu. This will open an Assistant which steps you through the process to create a label layout for your database.

Label Layout Assistant

Note: You will only see the Label Layout Assistant screen if you choose "New Label Layout" from the Layout menu. If you use the Label Layout Assistant then you do not need to continue on to Step Two. If you chose "New Layout" from the Layout menu then continue on to Step Two.

Step Two

Type a name for the layout, and click the Labels radio button.

Label Name and Type Dialog Box

Step Three

If you're using Avery labels, choose the number of the Avery label from the pop-up menu. Otherwise, choose Custom. Then click OK.

Choosing Label Menu

Step Four

If you chose Custom, enter the number of labels across the page and the horizontal and vertical dimensions of your labels. Then click OK.

Number and Size

Note: Include the space between labels in your horizontal and vertical measurements. In other words, the horizontal measurement is the distance from the left edge of one label to the left edge of the next; the vertical measurement is from the top of one label to the top of the next.

Horizontal and Vertical Measurement

Step Five

From the field List, select each field you want to include on the label, then click Move. The order in which you move fields is the order in which they appear on the label.

Tip: You can also double-click a field name to move it.

Set Field Order Dialog Box

Step Six

If necessary, choose Layout from the Layout menu and arrange the fields or otherwise customize the layout.

For additional assistance with layouts see "Creating and working with database layouts."

For information on creating labels with AppleWorks 5, see "AppleWorks 5: Creating and Printing Labels"

WebObjects 4.5: JDK and Pentium 4 Compatibility Issue

This article describes an incompatibility between Sun's Java Development Kit (JDK) 1.1.8, which ships with WebObjects 4.5, and Intel's Pentium 4 processor. This issue prevents Java applications from successfully opening or compiling.

This article has been archived and is no longer updated by Apple.
The version of the JDK that ships with WebObjects 4.5 fails to properly identify Intel's Pentium 4 processor. When you attempt to open a Java application, Windows generates a Dr. Watson error against jrew.exe. The fault lies in the Symantec Just in Time compiler that ships with Sun's JDK. There is a workaround provided below that some customers have reported using successfully. However, it has not yet been tested or certified by Apple Computer. A certified solution will be provided in the near future.

Current workaround

1. Download Sun's updated JDK 1.1.8_006 from http://java.sun.com/products/jdk/1.1/download-jdk-windows.html. This update adds support for the Pentium 4.
2. Back up the old JDK shipped with WebObjects 4.5 located at $NEXT_ROOT/Library/JDK.
3. Unpack and install the updated JDK into the $NEXT_ROOT/Library/JDK. See Sun's web site for detailed instructions and requirements before performing this step.

Downloading files from a .Mac HomePage File Sharing webpage

If you're having trouble downloading files from a .Mac (pronounced "dot Mac") HomePage File Sharing webpage, there are a few things you can do.

This article has been archived and is no longer updated by Apple.

You might see one of these symptoms:

- The computer does not recognize the file you downloaded.
- Instead of downloading the file, the Web browser opens a new window with the contents of the file (for example, a picture).
- The file opens in an application installed on the system (for example, a movie may open in Windows Media Player).

Each of the symptoms listed in this article has specific solutions.

File Not Recognized
The filename of the downloaded file may have extra characters appended to it, which can prevent the computer from recognizing the three-character filename extension. Check the downloaded file's full filename, and make sure the three-character filename extension is the last part of the filename. The computer may be set up to hide the filename extension. If so, you must set up the computer to display complete filenames before you can check the three-character filename extension.

File Displayed In New Window
Save the contents of the new window using the Save command in your Internet browser. Alternatively, on a PC, you can right-click the link in the .Mac HomePage File Sharing webpage and choose "Save Target As" from the shortcut menu. This downloads the file to the PC, and prevents a new window from opening with the file's contents.

Opens instead of downloading
You can usually save the file by choosing Save or Save As from the application's File menu. You can also right-click or command-click the link in the .Mac HomePage File Sharing webpage and choose "Save Target As" from the shortcut menu.

Mac OS X Server: AppleShare Client Delay After Stopping A File Copy

When copying a file to a Mac OS X Server host through AppleShare, the Copy progress dialog box may remain for a time after you click Stop to stop the operation. Wait for the dialog box to close; do not force-quit the Finder or reset the computer.

This article has been archived and is no longer updated by Apple.

Symptom

If you click Stop in the Copy progress dialog box while a file is being copied from the computer to the server, the dialog box may remain for a long period of time. Sometimes, the wait is so long it seems as if the computer has stopped responding.

Solution

Wait until the dialog box closes. Do not force-quit the Finder or reset the computer.

The length of time that the dialog box remains open depends upon how large a file is being copied and how early in the copy process you click Stop. Larger files and earlier stoppages result in longer waits. For example, clicking Stop when a 2 GB file begins to copy may result in a 90-second wait for the Copy progress dialog box to close.

The Finder allocates space for the entire file when the copy is started. When you click Stop, the Finder attempts to close the file so it can be deleted. However, since the entire file has not been written, Mac OS X Server writes zeros over the portion of the disk allocated to the file that the Finder did not write over. This is to prevent data on previously unused sections of the disk from being incorporated into the file. Once this zero fill has completed, the client returns to normal operation.

Published Date: Oct 10, 2016

Mac OS X: Do Not Use Leading Zeros in IP Address

Mac OS X and Mac OS X Server treats IP addresses with leading zeros as if they were octal numbers. Therefore, do not use leading zeros when setting up the Mac OS X Server IP address through Network Preferences.
This article has been archived and is no longer updated by Apple.

Symptom

A Mac OS X or Mac OS X Server computer cannot make a network connection. Additionally, the IP address shown in Network Preferences is different than the address originally entered.

Product affected

- Mac OS X
- Mac OS X Server

Solution

Do not use leading zeros when setting up a Mac OS X or Mac OS X Server IP address in Network Preferences.

If an IP address is entered with leading zeros, Mac OS X interprets and converts the numbers to octal form rather than decimal form. For example, an IP address entered as 010.011.012.013 is converted by Mac OS X to 8.9.10.11 rather than 10.11.12.13.

TechTool Deluxe: False "Problems" Reported When Used With Mac OS X 10.0

Use TechTool Deluxe with Mac OS 9. With Mac OS X 10.0, a variety of false "problems" are reported.

This article has been archived and is no longer updated by Apple.

Symptom

After copying TechTool Deluxe to your Mac OS X 10.0 hard disk and opening it to test your computer, TechTool Deluxe generates a report with one or more false "problems".

Solution

Start up the computer with Mac OS 9 before testing with TechTool Deluxe.

For related information on TechTool Deluxe, please see article 25141: "**Apple Protection Plan CD: Cannot Be Startup Disk on All Macintosh Computers**"

Important: This does not apply to the dual system version of the AppleCare Protection Plan CD (Includes both Mac OS 9 and Mac OS X on a single CD). This CD contains a version of the TechTool Deluxe application that works correctly using Mac OS X. Follow the directions on this CD on how to run TechTool Deluxe for Mac OS X.

Network Assistant 4.0.x: Set Energy Saver Settings Do Not Work

Energy Saver settings on client workstations cannot be changed by Network Assistant if the administrator's computer has Mac OS 9.1.

This article has been archived and is no longer updated by Apple.

Symptom

You are unable to change the Energy Saver settings of a Network Assistant client workstation. An alert box appears with the message, "This workstation does not support Energy Saver."

Solution

Energy Saver settings on client workstations cannot be changed by Network Assistant if the administrator workstation is one of the above computers.

Note:

- Network Assistant 3.6.x client software is for use with Mac OS 8.1 through Mac OS 8.6.
- Network Assistant 4.0.3 client software is the only version of the Network Assistant 4 client software that is compatible with Mac OS 8.1 through Mac OS 8.6.

DVD Studio Pro: Requirements for Importing Multi-Segment MPEG-2 Streams

This article lists the requirements for importing multi-segment MPEG-2 streams into DVD Studio Pro.

This article has been archived and is no longer updated by Apple.
If you intend to import multi-segment streams into DVD Studio Pro, the streams must meet **all** of the following criteria:

- They must be numbered in sequence by adding a suffix to the filenames, using the form ".1" to ".99" or ".01 to .99", such as:

```
filename.01
filename.02
filename.03
```

- Video streams must have continuous timecode. In other words, the timecode for the last frame of the first file must be exactly one frame before the timecode for the first frame of the second file (and so on.)
- The total length of any selected audio streams should match the total length of the video streams.

Background

Prior to the advent of the Mac OS Extended (HFS Plus) disk format, Mac OS file sizes could not exceed 2 GB. Consequently, some third-party MPEG-2 encoders create multi-part MPEG streams, with each segment smaller than 2 GB. Now that Macintosh computers come with disks that use the HFS Plus format, it is no longer necessary to split MPEG-2 files larger than 2 GB. However, some MPEG-2 encoders still do this.

DVD Studio Pro: Image Files Stored in DVD/CD-R Master Format

DVD Studio Pro saves a disc image file as a UDF, ISO 9660 DVD/CD-R master.

This article has been archived and is no longer updated by Apple.
After selecting "Build and Format Disc", there is an option for "Save as Image File". DVD Studio Pro saves the image file as a UDF, ISO 9660 disc in DVD/CD-R master format. If you are using DVD Studio Pro 1.5 for Mac OS X, you can make this disk image available using Disk Copy, which is located in /Applications/Utilities. If you have a DVD-R drive, you can also burn this type of image using Disk Copy.

If you are using DVD Studio Pro 1.0 through 1.5 for Mac OS 9, you must use a third-party disc image utility such as Roxio Toast to make available or burn the image.

AirPort 1.3: PPPoE and Private Network 192.x.x.x Addresses

AirPort 1.3 has a PPPoE feature, so there is no need for a separate PPPoE application in order to connect to the Internet. With AirPort 1.3, you cannot enter a private network address (in the range 192.x.x.x) into an AirPort Base Station. This article tells how to set up an AirPort Base Station with AirPort 1.3 software and PPPoE to connect to the Internet.

This article has been archived and is no longer updated by Apple.
Some Internet Service Providers (ISP) who require PPPoE for their DSL service may require that a private 192.x.x.x IP address be assigned to the AirPort Base Station. These ISPs use a PPPoE application (for example, MacPoET) for authentication purposes. In the past, to use the PPPoE application, the client had to be set up with a private static IP address of 192.x.x.x. However, AirPort 1.3 software includes a PPPoE feature and no longer requires a separate PPPoE application.

An ISP might not know that you are using an AirPort Base Station with AirPort 1.3. Because of this, they may try to have you enter a private IP 192.x.x.x address into the AirPort Admin Utility. However, AirPort 1.3 does not allow you to manually assign an IP address.

Follow these steps to set up an AirPort Base Station with AirPort 1.3 software and PPPoE for a connection to the Internet:

1. Open the AirPort Admin Utility and select your Base Station.
2. Click Configure and enter your password.
3. Click the Internet tab.
4. Choose PPP over Ethernet (PPPoE) from the Connect using pop-up menu.
5. If required by your ISP, enter your user name, password and service name in the appropriate fields.
6. Click Update.
7. After the base station restarts itself, quit the AirPort Admin Utility.

You can now open the AirPort application and connect.

Note that you can also configure the AirPort Base Station to connect automatically. In that case, simply open your Web browser (or other Internet-based application) to connect to your ISP.

Mac OS 9: Incompatible Resolution or Scan Rate Could Cause Blank Screen at System Startup Time

An improper shutdown while the monitor is set to an incompatible resolution or scan rate could cause a lack of video at system startup time.

This article has been archived and is no longer updated by Apple.

Symptom

The monitor does not display any video when the computer is turned on, or displays a video image briefly at but then goes blank part way through the startup process. An alert box may appear with a message about the monitor's sync rate or resolution.

Solution

The system is attempting to use an incompatible display resolution or scan rate. Follow these steps to restore the monitor:

1. Reset the computer's parameter RAM (PRAM). For information on resetting PRAM, please see article 2238: "**Macintosh: How To Reset PRAM and NVRAM**"

2. Start up the computer with extensions off. To do this, hold down the Shift key when you turn on the computer until the message, "Extensions Off" appears.

3. After the desktop appears, drag these items from the Preferences folder (within the System Folder) to the Trash:

    - Display Preferences file
    - Monitor Preferences folder
    - preferences file for third-party resolution switching software, if installed

4. Restart the computer.

5. Set up the monitor's resolution as desired.

Resetting PRAM affects other settings, as noted in article 2238. You may need to reconfigure these settings, too.

Note: If you have more than one hard disk or partition, the computer may start up using a different System Folder than the one in use when the issue occurred. If so, be sure to remove the Display Preferences and Monitor Preferences from the System Folder that was in use when you experienced the issue.

Background

This behavior may have immediately followed a forced restart or other improper shutdown while the monitor was using an incompatible resolution or scan rate. An incompatible resolution is one that does not appear in the Monitors control panel.

There are several ways an incompatible resolution or scan rate can be set. Certain games change the resolution and/or scan rate when loading, and some utilities allow display resolutions to be selected that are not available in the Monitors control panel.

PowerBook G4: Display Options With External Monitor

This article lists the available picture size, frame rate, and pixel depth settings for the original PowerBook G4 display when combined with an external monitor for dual display.

This article has been archived and is no longer updated by Apple.
The original PowerBook G4 has a built-in connector for an external VGA, SVGA, or XGA monitor or projection device. An optional adapter allows the user to attach a standard Apple video cable. The PowerBook G4 also has an S-video connector that supplies a video signal for an NTSC or PAL video monitor or VCR. An external monitor or projection device connected to the computer can increase the amount of visible desktop space. This way of using an external monitor is called dual display to distinguish it from mirror mode, which shows the same information on both the external display and the built-in display.

With the included adapter, the PowerBook G4 computer can be used with any Apple monitor except those that have only an ADC or DVI connector. The computer also supports VGA, SVGA, and XGA monitors. The table below lists the picture sizes and frame rates supported.

PowerBook G4			
Picture Size (pixels)	**Frame Rate**	**Pixel Depth (Flat Panel Inactive)**	**Pixel Depth (Flat Panel Active)**
512 by 384	60 Hz	24 bpp*	24 bpp
640 by 480	60 Hz	24 bpp	24 bpp
640 by 480	67 Hz	24 bpp	24 bpp
640 by 480	72 Hz	24 bpp	24 bpp
640 by 480	75 Hz	24 bpp	24 bpp
640 by 480	85 Hz	24 bpp	24 bpp
640 by 870	75 Hz	24 bpp	24 bpp
800 by 600	56 Hz	24 bpp	24 bpp
800 by 600	60 Hz	24 bpp	24 bpp
800 by 600	72 Hz	24 bpp	24 bpp
800 by 600	75 Hz	24 bpp	24 bpp
800 by 600	85 Hz	24 bpp	24 bpp
832 by 624	75 Hz	24 bpp	24 bpp
1024 by 768	60 Hz	24 bpp	24 bpp
1024 by 768	70 Hz	24 bpp	24 bpp
1024 by 768	72 Hz	24 bpp	24 bpp
1024 by 768	75 Hz	24 bpp	24 bpp
1024 by 768	85 Hz	24 bpp	24 bpp
1152 by 870	75 Hz	24 bpp	24 bpp
1280 by 960	75 Hz	24 bpp	16 bpp
1280 by 1024	60 Hz	24 bpp	16 bpp
1280 by 1024	75 Hz	24 bpp	16 bpp
* bpp=bits per pixel			

The PowerBook G4 includes 8 MB of video memory, which is enough to provide pixel depths up to 24 bits per pixel on all supported monitors when the flat panel display is inactive (display closed). When an external video monitor and the flat panel display are operating at the same time, half the video memory is available for each. In that case, the maximum pixel depth available on the external monitor at the 1280-by-960 and 1280-by-1024 picture sizes is only 16 bpp.

To identify which model PowerBook G4 computer you have, see technical document 88248, **"PowerBook G4 Computers: How to Identify Different Models"**.

Final Cut Pro 2.0: Exporting Audio in OMF Format For Use With Pro Tools

This article explains how to obtain best results when you export audio from Final Cut Pro 2 to OMF format for use with Digidesign's Pro Tools audio software.

This article has been archived and is no longer updated by Apple.

Background

Final Cut Pro 2.0 introduces the option to export audio to Open Media Framework (OMF) format. Final Cut Pro exports OMF version 2.0. OMF is a file format that facilitates the transfer of digital media from one application to another. For example, Final Cut Pro 2 can export audio to an OMF file, which can then be converted into a Pro Tools project file for further audio manipulation.

To use one of the Digidesign Pro Tools digital audio applications, you must first convert the OMF file to a Pro Tools project file. There are two applications from Digidesign that can be used to convert OMF files into Pro Tools project files:

- OMF Tool
- DigiTranslator

These two applications have different capabilities; DigiTranslator has more features than OMF Tool. For best results, it is important to export your audio from Final Cut Pro 2 into an OMF file in a way that these conversion applications can best handle. The considerations are explained later in this article.

There are also three different Pro Tools digital audio applications:

- Pro ToolsFree
- Pro ToolsLE
- Pro ToolsTDM

The Pro Tools application you use may also affect how you export OMF files from Final Cut Pro.

Considerations for Best Results

To obtain best results with the OMF conversion utility and Pro Tools digital audio application you use, you must consider these factors:

- Whether or not to export Crossfades.
- How many tracks are supported by each version of Pro Tools
- Which sample rates work with each version of Pro Tools
- What to do if you discover audio artifacts at the end of your imported tracks after conversion.

When to Export Crossfades in OMF Files

OMF Tool 2.0.8 is a free utility from Digidesign that has many useful features such as sample rate, bit depth, and edit rate conversion. OMF Tool 2.0.8 does not, however, support Final Cut Pro audio transitions (such as audio crossfades). If you are going to be using OMF Tool to convert OMF files that you exported from Final Cut Pro, make sure that you deselect the Include Crossfade Transitions box in the OMF Audio Export window when exporting from Final Cut Pro. This results in the crossfades in your project being left out of the resulting OMF file so that it can be easily converted using OMF Tool.

Digidesign's other OMF file conversion utility is DigiTranslator. DigiTranslator is a robust conversion application that has full support for Crossfades exported from Final Cut Pro, so you can leave the Include Crossfade Transition option in the OMF Audio Export window selected.

Figure 1 Final Cut Pro 2 OMF Audio Export dialog box

Audio Artifacts at the End of Tracks

When translating OMF files using OMF Tool 2.0.8, the resulting converted Pro Tools project file may contain an audio artifact just after the last clip on each track. To avoid this, you can add audio slug after the last clip on every track.

DigiTranslator does not exhibit this behavior.

Track Limits when Exporting OMF Files

Final Cut Pro exports a maximum of 99 audio tracks when using the OMF Audio Export command. How many of these tracks can be imported into Pro Tools depends on which of the three versions of Pro Tools you use.

Application	Audio Playback Tracks
Pro Tools Free	8
Pro Tools LE	24
Pro Tools TDM	72

Which Sample Rate to Use When Exporting OMF Files

When you export a Final Cut Pro project to OMF, all of the audio in the newly exported OMF file is converted to the same sample rate. For example, your Final Cut Pro project file may have several QuickTime video clips with 48 kHz audio, mixed with several AIFF music clips at 44.1 kHz. When you export the audio tracks from this project using the OMF Audio Export command, all of the audio from your Final Cut Pro project is converted to the same rate, as specified in the Sample Rate pop-up menu of the OMF Audio Export window. The sample rate you use when you export partially depends on whether you are using OMF Tool or DigiTranslator, and which version of Pro Tools you use.

OMF Tool 2.0.8 does not support OMF files that are exported with a sample rate of 32 kHz. DigiTranslator supports all three sample rates.

While Pro Tools LE and Pro Tools TDM both have support for 32 kHz, 44.1 kHz, and 48 kHz audio, Pro Tools Free supports only 44.1 kHz audio. When exporting OMF files for use with Pro Tools Free, set the Sample Rate pop-up menu in the OMF Audio Export window to 44.1 kHz.

AppleWorks 6: How to Set the Clippings Cache Size

This article explains how to set the Clippings cache size in AppleWorks 6. This can be a way for Macintosh Manager administrators to affect workstation performance and hard disk storage space, particularly with AppleWorks 6.1.x.

This article has been archived and is no longer updated by Apple.

Follow these steps to change the Clippings cache size:

1. Open AppleWorks.
2. If the Clippings window is not open, choose Show Clippings from the File menu; the Clippings window appears.
3. Control-click in the Clippings window to open the contextual menu; choose Clippings Settings from the menu.
4. In the Clippings Settings window (see Figure 1), set the cache size to a new value.

Figure 1 Clippings Settings window

Set the cache size to 0 if you do not want any clippings data cached.

Note: The cache size setting only limits the size of the folder after quitting AppleWorks, and does not prevent AppleWorks from storing clippings data in the cache while running.

The Clippings cache is used to store downloaded Web clippings files. Cached clippings can be retrieved instantly, which increases performance. Decreasing the cache size can increase how often clippings must be downloaded again. If the Clippings cache is set to 0 MB, clippings are downloaded each time they are used.

Macintosh Manager administrators may choose to set the Clippings cache on workstations to affect performance or hard disk usage/storage. This is particularly true with AppleWorks 6.1.x, which stores the cache within a user's documents folder.

AppleShare IP: Web Server Plug-Ins Must Be on Startup Disk

Web plug-ins in the AppleShare IP Plug-Ins folder will load only if the Web Folder is on the startup disk of the server. This article explains how to move the Web Folder to the correct location.

This article has been archived and is no longer updated by Apple.

Symptom

Plug-ins in the Plug-Ins folder inside the Web Folder do not appear under the Plug-Ins tab in the Web Server Settings window of Mac OS Server Admin.

Solution

1. Open the Mac OS Server Admin application and log on to the server; a miniwindow with graphic buttons appears (see Figure 1).

   Figure 1 Miniwindow with graphic buttons

2. Choose Stop Web Server from the Web Services button in the Mac OS Server Admin miniwindow. (The Web Services button is portrayed with a global image of Earth.)
3. Drag the Web Folder to the server's startup disk.
4. Choose Configure Web Server from the Web Services button in the Mac OS Server Admin miniwindow; a window appears.
5. Click the General tab within the window.
6. Click Current Web Folder .
7. Navigate to the Web Folder on the server startup disk.
8. Click Choose.
9. Click Save.
10. Choose Start Web Server from the Web Services button in the Mac OS Server Admin miniwindow.
11. If you wish, choose Disconnect (or Quit) from the File menu of the Mac OS Server Admin application.

AppleWorks 6: Opening Documents Created by Other Programs

This article explains how to use AppleWorks 6 to open documents created by other programs such as MS-Word, and generic formats such as RTF, ASCII text, and others.

This article has been archived and is no longer updated by Apple.

You can use AppleWorks to open documents created in a variety of other applications, including documents in text-only and other generic formats. AppleWorks attempts to preserve the original document's text, colors, layout, and other formatting options.

To open a document created with another application:

1. Choose Open from the File menu.
2. Choose the type of document that you want the imported document to become in AppleWorks from the Document Type pop-up menu (see Figure 1). For example, you can open an ASCII text or RTF file as a word-processing or spreadsheet document.

   Figure 1 Choosing a Document Type

3. Choose a file format from the File Format pop-up menu (see Figure 2).

   Figure 2 Choosing a File Format

4. Select the document and click Open. The scrolling list shows all documents of the selected file format in the folder specified above the list.

If you don't see the file you're trying to open:

Choose All Types from the Document Type pop-up menu and All Available from the File Format pop-up menu (see Figure 3). If you still don't see the file, the AppleWorks translators are not able to translate the file. Try using a generic file format. For example, use Text or RTF for word-processing files.

Figure 3 Choosing All Types and All Available Formats (Mac OS 9)

Note: In Mac OS X, the files may be visible, but the icons will be slightly dimmed regardless of which document type or file format is selected. If you attempt to click the file and nothing is selected, then the file cannot be opened with the current document type or file format. Figure 4 below shows a file being successfully selected after choosing All Types as the Document Type and All Available as the File Format.

Figure 4 Choosing All Types and All Available Formats (Mac OS X)

For a list of file formats that AppleWorks 6 can use, please see article 25300: "**AppleWorks 6: List of Available File Formats**"

Published Date: Feb 17, 2012

Mac OS X 10.0, 10.1: How to Import Email Addresses From Outlook Express

This article explains how to import email addresses from Microsoft Outlook Express (in the Classic environment) to the Mac OS X application Mail.

Important: This document only applies to versions of Mail which were included in Mac OS X 10.0 through 10.1.5. For information about importing addresses with Mac OS X 10.2, see technical document 106996: "**Mac OS X 10.2: About Import Addresses and Other Mail Scripts**".

This article has been archived and is no longer updated by Apple.
Follow these steps to import email addresses from Microsoft Outlook Express to the Mac OS X application Mail:

1. Open Outlook Express in the Classic environment.
2. Choose Export Contacts from the File menu.
3. Save the Contacts Export file in your Home directory for convenience.
4. Quit Outlook Express.
5. Open the Mac OS X Mail application.
6. Choose Addresses from the Window menu.
7. Choose Import from the File menu.
8. Select the Contacts Export file.

Mac OS X 10.0: Using Mac OS 9 Control Panels in Classic Environment

This article describes the functions of Mac OS 9 control panels within the Mac OS X Classic environment.
This article has been archived and is no longer updated by Apple.
Note: This information applies to Mac OS X 10.0 to 10.0.4 when used with Mac OS 9.1 Classic environment control panels. If you use Mac OS 10.1 with Mac OS 9.2.1, Classic environment control panels may give results differing from those described below. For example, the Mac OS 9.2.1 Software Update control panel works with Mac OS 10.1 (for updating Classic environment software items).

You can use some Mac OS 9.1 control panels in the Mac OS X Classic environment to make and change system settings. However, not all Mac OS 9.1 control panels work in the Classic environment. Some control panels may have limited capabilities, and others may be turned off. In these cases, the Mac OS X System Preferences application replaces these control panels and their functions. Below is a list of control panels and a description of their functions in the Mac OS X Classic environment.

Appearance control panel

- Changes to Desktop picture are not apparent in Classic. Click the Finder icon in the Dock, and choose Preferences from the Finder menu in Mac OS X instead.
- Sound Track only works in Classic applications.
- If you change the System or Views font it will only affect the Classic environment and Classic applications.

Note: Changes you make in this control panel that are not apparent in the Classic environment are apparent when you start up the computer from the Mac OS 9.1 System Folder.

AppleTalk control panel

You can adjust AppleTalk settings for the Classic environment. Settings made in this control panel do not change those made in the Mac OS X Network pane of System Preferences. AppleTalk settings for Mac OS X and the Classic environment can be configured independently.

Control Strip control panel

The Mac OS 9 Control Strip is disabled in Classic. Use Mac OS X System Preferences instead. Mac OS X includes Dock extras that you can use to change certain settings from the Dock, such as monitor resolution and color depth. You will find these in the Applications folder on your Mac OS X disk. To use a Dock extra, drag it to the Dock, and click its icon to choose a command from the pop-up menu. Dock extras can also indicate the status of certain items, such as the computer's battery level.

Date & Time control panel

This control panel can be used to set the date and time notation used in Classic applications, and to adjust the menu bar clock's appearance and hourly chime within the Classic environment only. Use the Date & Time pane in Mac OS X System Preferences to set the computer's date and time.

Energy Saver control panel

Use the Energy Saver pane instead.

Extensions Manager control panel

With Mac OS 9.1 as the Classic System Folder, this control panel allows Mac OS 9.1 system software components to be turned on and off as expected, though turning off certain components causes the Classic environment to work incorrectly. For related information, see article 106249: "**Mac OS X 10.0: Unexpected Classic Behavior When Using Mac OS 9.1 All or Base Extension Sets**".

File Sharing control panel

Volumes and folders cannot be selected for sharing. Guest and other user access may not work as expected. File sharing over TCP/IP (which is required for Mac OS X peer-to-peer networking) cannot be enabled. Instead, use the Sharing pane of Mac OS X System Preferences to share a Public folder, or enable FTP access and remote login.

General Controls control panel

Options that affect only the Classic environment are available; those which do not are dimmed.

Infrared control panel

This control panel does not work in the Classic environment.

Keyboard control panel

Use the Keyboard pane in Mac OS X System Preferences to set the Key Repeat Rate and the Delay Until Repeat. For information on the other settings available in the Mac OS 9 Keyboard control panel, please see article 106268: "**Mac OS X 10.0: Using the Keyboard Control Panel in Classic**"

Location Manager

This control panel does not work in the Classic environment.

Memory control panel

With Mac OS X 10.0, this can be used to adjust only the Disk Cache setting. You should not typically need to adjust this, but may set it to the minimum setting to conserve available memory. **Note:** If you start up the computer using the Mac OS 9.1 System Folder, you should reset the Disk Cache to its default setting.

Modem control panel

Use the Network pane instead. To change modem settings, choose the modem from the Configure pop-up menu in the Network pane, then click the Modem tab.

Monitors control panel

Use the Mac OS X Displays pane instead when possible. Certain Classic applications may require that you set the color depth to 256 colors, or the resolution to 640-by 480-pixels. In this case, you can use the Mac OS 9 Monitors control panel.

Mouse control panel

Use the Mouse pane instead.

Multiple Users control panel

Use the Users pane instead.

Password Security control panel

This control panel does not work in the Classic environment. To require a password, open the Login pane, click the Login tab, and deselect "Automatically log in".

PowerBook SCSI Disk Mode control panel

The PowerBook SCSI Disk Mode control panel does not work with the Mac OS X Classic environment.

Remote Access control panel

Remote Access does not work in the Classic environment. Instead, use the Internet Connect application and the PPP tab of the Network pane.

Software Update control panel

The Software Update control panel does not work in the Classic environment. For more information, please see article 106276: "**Mac OS X 10.0: Classic Does Not Allow Use of Software Update**"

Sound control panel

The Sound control panel in Classic can be used to choose the alert sound and alert volume for Classic and to change the master volume and mute settings for the underlying Mac OS X audio system. In Mac OS X 10.1, changes made to the master volume and mute settings through Classic will be effective across all of Mac OS X, but beware that the Sound pane of System Preferences will not update its display to reflect changes made by Classic. The Sound control panel in Classic will update its display to reflect changes made by the Sound pane of System Preferences or any other client of the Mac OS X audio system.

Startup Disk control panel

Use the Startup Disk pane instead.

TCP/IP control panel

Use the Network pane instead. Adjustments made with the Mac OS 9 TCP/IP control panel do not take effect.

Trackpad control panel

Use the Mouse pane instead.

Web Sharing control panel

Use the Sharing pane instead.

Power Mac G4 (Digital Audio): Apple Hardware Test 1.1 Reports False Error

Apple Hardware Test 1.1 may report a false error when testing a hard drive on a Power Mac G4 (Digital Audio) computer that has two or more ATA hard drives installed. Use a later version of Apple Hardware Test, or start up the computer from the Apple Hardware Test 1.1 CD before running the test.

This article has been archived and is no longer updated by Apple.

Symptom

The Apple Hardware Test (AHT) 1.1 Hard Drive test reports this error code the first time it is run after starting up:

ata1/6/3 HD:2,1

Solution

Apple Hardware Test 1.2 resolves this issue.

Follow these steps to work around the issue with Apple Hardware Test 1.1:

1. Restart the computer with the Apple Hardware Test CD. (Do not shut down and start up; you must click Restart in the Hardware Tests window.)
2. Re-run the diagnostic.

If the hard disk is functioning properly, the error should not be reported by Apple Hardware Test 1.1.

Mac OS X 10.0: (2Z691-3064) CD Installation Information

This article provides installation and compatibility information about the Mac OS X 10.0 (2Z691-3064) CD, which is not available in all regions (including the United States).
This article has been archived and is no longer updated by Apple.

Which Mac OS X 10.0 CD Do I Have?

The Mac OS X 10.0 CDs may be distinguished by the part number printed on the white CD silkscreen:

- Mac OS X 10.0 CD part number 1Z691-2974-A (released 2001-03-24)
- Mac OS X 10.0 CD part number 2Z691-3064 (released 2001-06)

Important: If you want to install versions of Mac OS X from each CD, partition your hard disk and install each version of Mac OS X 10.0 on a different partition. Do not install a version of Mac OS X from one CD over a version of Mac OS X from the other CD.

What's Included on The CD and Where Can I Find It?

The Mac OS X 10.0 (2Z691-3064) CD offers Mac OS X 10.0 in the following languages:

- Swedish
- Norwegian
- Finnish
- Danish
- Brazilian-Portuguese
- Korean
- Chinese (Traditional)
- Chinese (Simplified)

The Mac OS X 10.0 (2Z691-3064) CD is available in countries that are primarily associated with the languages listed above; it is not available in all regions, including the United States. The English, Japanese, German, and French languages are also included for your convenience.

Interlacing: How to prevent jagged lines in video

This article has been archived and is no longer updated by Apple.

Learn what interlacing is, shows what it looks like, and read suggestions about how to prevent it when creating and editing movies.

Q. What is interlaced video and what is a progressive scan monitor?

A. Most consumer video cameras capture two fields per frame. The two fields are *interlaced* with each other. That is, the odd horizontal lines are from one field and the even lines are from the other. Televisions display one field after the other, while progressive scan monitors display both fields simultaneously. Computer monitors fall into the progressive scan category.

Example of interlacing

Q. In iDVD and DVD Studio Pro, jagged lines in the video are visible during preview and even after burning to disc in Apple DVD Player. What is this?

A. This may be the effect of displaying interlaced video on a progressive scan monitor.

Q. Why do jagged lines appear?

A. Since the computer monitor doesn't interpret fields like a TV does, you may see interlacing when there is fast camera or object movement. This is the effect of displaying two moments in time simultaneously. When watching the DVD on a normal TV, the interlacing effect is not noticeable.

Q. Is there any way to prevent this?

A. Yes. Some application programs such as Final Cut Pro have an option to de-interlace the video. De-interlacing the video before importing into iDVD or DVD Studio Pro prevents this effect on computer monitors (see Figure 2), though the motion may not be as smooth on a TV. Check the user's manual for your software to see if it offers this feature and how to use it. Also, some video cameras have an option for progressive scan (Canon calls it "Movie Mode"). Shooting video in this way captures an entire frame at a time instead of two fields and prevents the interlacing effect.

Image after correction

DVD Player 4.5 or later (in Mac OS X 10.4 or later) includes an option to deinterlace video. Choose Window > Video Color. In the Video Color window, select the Deinterlace video checkbox.

Q. Why does this effect only occur on DVD-R discs, but not commercial DVD-Video discs?

A. Movies on commercial DVD-Video discs are typically made with film cameras. Unlike video, film does not use fields or interlacing so you do not see this effect.

For more information on fields and interlacing, please see article 58634: "**Final Cut Pro: Field Dominance Discussion**"

Apple Studio Display (ADC): Pressing Button Does Not Open System Preferences

With Mac OS X, pressing the button on the lower left of the front of the Apple Studio Display LCD (ADC) and Apple Studio Display 17 (ADC) does not open the Displays pane of the System Preferences application.

This article has been archived and is no longer updated by Apple.

Symptom

Pressing the button on the lower left of the front of the Apple Studio Display (ADC) does not open the Displays pane of the System Preferences application.

Solution

Follow these steps to open the Displays pane of System Preferences:

1. Choose System Preferences from the Apple menu.
2. Click Displays to open that pane within the System Preferences window.

After closing System Preferences, pressing the button opens the Displays pane of System Preferences. However, pressing it again does not close System Preferences.

The symptom described above will recur if you log out or shut down the computer. A future Mac OS X update may provide the button with full and persistent functionality.

Mac OS: Application Switcher Miniwindow Shows No Close or Zoom Boxes

The Application Switcher miniwindow can be opened in ways that do not include a title bar, close box, or zoom box. This article explains how to restore those elements so that the miniwindow can be closed, moved, and resized.

This article has been archived and is no longer updated by Apple.

Symptom

While viewing the Mac Help topic "Switching between open programs", clicking the link titled "Open the Application Switcher in icon view for me" or the link titled "Open the Application Switcher in a horizontal row for me" causes the Application Switcher miniwindow to open without a title bar, a close box, or a zoom box. See Figures 1 and 2.

Figure 1 Application Switcher miniwindow in icon view

Figure 2 Application Switcher miniwindow in a horizontal row

Solution

Follow these steps to restore the Application Switcher miniwindow to its default state, which includes a title bar, a close box, and a zoom box (see Figure 3):

1. Make the Finder active by clicking the desktop.
2. Choose Mac Help from the Help menu; the Mac Help window opens.
3. Click "Files and programs" within the Mac Help window.
4. Click "Switching between open programs" within the Mac Help window.
5. Click "Restore the default display settings for the Application Switcher for me". (You may have to scroll toward the bottom of the window's contents in order to see this item.)

Figure 3 Application Switcher miniwindow in its default state

You can now move the miniwindow by dragging its title bar, quickly resize it with the zoom box, or close it with the close box.

For more information on the Application Switcher and its options, refer to the following articles:

Article 58093: "**Mac OS: Key Commands for Application Switcher**"
Article 58067: "**Mac OS: Application Switcher Overview**"

AppleWorks 6.0.4: Dimmed Apple, File, Edit Menus Resolved With AppleWorks Update

If the Apple, File, and Edit menus are dimmed with AppleWorks 6.0.4, update to AppleWorks 6.2 or later.

This article has been archived and is no longer updated by Apple.

Symptom

After opening AppleWorks 6.0.4, the Apple, File, and Edit menus are dimmed. You cannot quit by choosing Quit from the File menu, nor can you use the command-key equivalent (Command-Q).

Solution

1. Download and install **AppleWorks 6.2 Updater** or later.
2. Download and install **CarbonLib 1.4** or later.

If the issue persists after installing the AppleWorks update, search your hard disk for duplicate copies of AppleWorks, and delete all but the copy that has been updated.

WebObjects 5: Converting WebObjects 4.5 Projects

This article explains how to convert WebObjects 4.5 projects to WebObjects 5.0 format with Mac OS X.

This article has been archived and is no longer updated by Apple.
These instructions explain how to convert WebObjects 4.5 projects to WebObjects 5.0 format with Mac OS X. They should be used in conjunction with the instructions for using the JavaConverter tool. The JavaConverter instructions, in pdf format, are available at http://developer.apple.com/techpubs/webobjects/JavaConverter.pdf

Have the JavaConverter instructions available when you step through the instructions below.

Converting WebObjects 4.5 Projects to WebObjects 5.0 Format

Step 1

Open /Developer/Applications/ProjectBuilderWO and then open the WebObjects 4.5.x project.

Step 2

In the build pane, click the "clean" button. Close ProjectBuilderWO; it will not be used again during this procedure.

Step 3

Run the JavaConverter according to the instructions in the JavaConverter document. On Mac OS X the JavaConverter is located in /System/Library/WebObjects/JavaApplications. It is possible to run the JavaConverter on Mac OS X as well as Mac OS X Server (1.2 and 10.0). The instructions in the JavaConverter.pdf document work with all these platforms.

Step 4

Open /Developer/Applications/ProjectBuilder.

Step 5 (Primary Version)

Choose Import Project from the File menu.

In the "Import Project Assistant" choose "Import PB.proj" and click Next. Click Set to locate the converted project, or enter its location in the text box.

Once the converted project has been imported, add the JavaJDBCAdaptor.framework by choosing Add Frameworks from the Project menu. This framework is located at /System/Library/Frameworks/JavaJDBCAdaptor.framework. In the sheet that appears, be sure to click on the Application Server Target so that the framework is added to it.

Step 5 (Alternate Version)

You should use this alternate version of the Step 5 instructions only if the Step 5 (Primary Version) instructions do not result in a workable project.

Create a new project of the same type as your converted project. For example, if you convert a "WebObjects Application" you will want to create a project of type "WebObjects Application" within ProjectBuilder.

In the Finder, navigate to the converted project's directory. Drag and drop the needed components, resources, and so forth to the "Groups & Files" section of the new project's window. You will be able to place the files in the appropriate places inside the new project hierarchy. Be sure to select the "Copy items into destinations group's folder (if needed)" checkbox and the "Create Folder References for any added folders" radio button in the sheet that appears when you release the mouse button.

Step 6

Search for the JC_ERROR, JC_WARNING, and JC_INFO messages in the converted project and fix them as needed. This is a manual process and may take some time depending on the size of the project.

Also, be sure to see reference 2628707 at http://developer.apple.com/techpubs/webobjects/ReleaseNotes/ReleaseNotes.html for more information on the conversion, including NSValidation issues.

Step 7

Open the model file and change the connection dictionary information and update the external/internal types. This is a manual process that updates the model file for use with the JDBC adaptor. Depending on your database and original model file, it may be quicker to create a new model file than convert an existing one.

Your project should now build successfully.

For information on how to set up the JDBC URL refer to your database's documentation, or refer to article 75145: "**WebObjects 5: How to Use Oracle JDBC Drivers**".

Network Assistant 4.0.x: Cannot Set Startup, Shut Down Schedules on Some Clients

Network Assistant software cannot be used to set or change startup and shut down schedules on certain Macintosh client workstations. The schedules must be set with the Energy Saver control panel on each client workstation.

This article has been archived and is no longer updated by Apple.

Symptom

With the Network Assistant application program, the "Schedule Start Up" dialog box does not allow you to turn off a startup or shut down schedule for a client computer. When you click the checkbox to turn off a schedule, the Change button becomes dimmed. See Figure 1.

Figure 1 Schedule Start Up dialog box with dimmed Change button

Solution

Use the Energy Saver control panel on each client computer to set or change startup and shut down schedules.

Network Assistant cannot change startup and shut down schedules on the client workstations listed in the Products affected section of this article.

Notes:

1. The parenthetical product description (Summer 2000) refers to the summer of the Northern Hemisphere.

2. Network Assistant 3.6.x client software is for use with Mac OS 8.1 through Mac OS 8.6. Network Assistant 4.0.3 client software is the only version of the Network Assistant 4 client software that works with Mac OS 8.1 through Mac OS 8.6.

Published Date: Oct 10, 2016

Mac OS: "Could Not Find a Translation Extension" Message

If the preference file for File Exchange or Mac OS Easy Open is unusable or out-of-date, the Finder may be unable to locate the application with which to open (or translate) a file. This article explains how to re-create and rebuild the preference file.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to open a file from the desktop, an alert box appears with this message:

> "The document could not be opened, because the application program that created it could not be found. Could not find a translation extension with appropriate translators."

However, you know that the necessary application program is installed on the computer.

Solution

Re-create the preference file(s) that store the associations between files and their applications/translators and then rebuild the Desktop file.

Step One: Re-Creating Preferences

Follow these steps to re-create the preference file(s):

- **Mac OS 8.5 through Mac OS 9.x**
  1. Locate the File Exchange Preferences file in the Preferences folder of the startup disk.
  2. Drag it to the Trash.
- **Mac OS 8.1 and earlier**
  1. Locate the PC Exchange Preferences file and the Mac OS Easy Open Preferences file in the Preferences folder of the startup disk.
  2. Drag them to the Trash.

Step Two: Rebuild the Desktop file

For complete information on rebuilding the Desktop file, refer to article 10182: "**Mac OS: Rebuilding Desktop File and Icon Recovery**"

Note: Even after following these steps, double-clicking on certain files will result in the symptom described above. These include files that do not contain type or creator information, or files whose filename extension is ".exe". Files with a filename extension of ".exe" are executables for MS-DOS, and require MS-DOS or Windows emulation software to work with Mac OS-based computers.

For more information on File Exchange, refer to article 58098: "**Mac OS: File Exchange Control Panel Features**"

Published Date: Oct 10, 2016

Apple Pro Keyboard (Italian): How to Produce Special Characters

The table below lists the keystrokes needed to produce various special characters with the Italian versions of the Apple keyboard and the Apple Pro Keyboard, when using the Italian layout of Mac OS 9 or Mac OS X 10.0.

This article has been archived and is no longer updated by Apple.
The table below lists the keystrokes needed to produce various special characters with the Italian versions of the Apple keyboard and the Apple Pro Keyboard, when using the Italian layout with Mac OS 9 or Mac OS X 10.0.

Macintosh Manager: Workgroup Data Volume Differences

This document discusses the differences between the Workgroup Data Volume section of Macintosh Manager Admin 1.0 and later and 2.0 and later.

This article has been archived and is no longer updated by Apple.
The Workgroup Data Volume option is located in the Workgroups:Options pane of Macintosh Manager Admin.

Macintosh Manager 1.0 and later

The Workgroup Data Volume is where all documents are stored while in a particular workgroup. It includes the user's documents folder as well as workgroup-specific folders (for example, Hand-In and Workgroup Shared folders).

With Macintosh Manager 1.0 and later, the Workgroup Data Volume is used to configure another documents storage location. For more information, refer to technical document 31265: "**Macintosh Manager 1.3: Saving Workgroup Documents to Another Volume**"

Macintosh Manager 2.0 and later

The Workgroup Data Volume is where workgroup-specific documents are stored, similar to Macintosh Manager 1.0. However, users' documents are no longer a part of this volume. Users' documents are now specific to each user's account (the 'Home Directory' option in Server Admin).

With Macintosh Manager 2.0 and later, the Workgroup Data Volume will not change the user's documents location, only the workgroup-specific folders (for example, Hand-In and Workgroup Shared folders). To change where users store their documents, use the Home Directory feature of Mac OS X Server 10.0 Server Admin to assign a custom location.

Published Date: Feb 17, 2012

Network Assistant 4: Difficulties With Copy Hard Disk and Copy Items Commands

Follow the steps in this document if you encounter difficulties with the Copy Items or Copy Hard Disk commands in Network Assistant 4.

This article has been archived and is no longer updated by Apple.

Symptom

When using Network Assistant 4 to copy items or an entire hard disk, an unexpected disconnection occurs. An alert box with a message may also appear.

Solution

Follow these steps in order until the issue is resolved. In addition to these steps, you should download and install the Network Assistant 4.0.5 update. This is available at Apple Software Downloads (http://www.apple.com/swupdates/).

Step 1: Check Mac OS and Network Assistant Software

Make sure all client and admin workstations have the appropriate versions of Mac OS system software and Network Assistant software. For more information on this topic, refer to technical document 25103: "**Network Assistant: Supported Versions and Configurations**"

Step 2: Check Port Numbers

If there is a router or firewall on your network, verify that UDP port 3283 is open. Network Assistant uses this port for IP communication with clients. For AppleTalk connections, Network Assistant uses DDP socket 39 to communicate with clients.

Network Assistant does not manage clients that are connected through Network Address Translation (NAT). To manage these clients, connect them directly to your network or join these networks with a dedicated router (gateway). For more information on port numbers and NAT, refer to technical document 31131: "**Apple Network Assistant: Important Information**".

Step 3: Use Disk First Aid

Use Disk First Aid on the admin and client computers; repair any "errors" found by Disk First Aid.

Network Assistant admin can check and repair Mac OS 9 client hard disks remotely. Follow these steps to use this feature:

1. Select the client(s).
2. Choose Disk Verification from the Report menu.
3. Click to enable the "Try to fix disk errors" option.
4. Click Get Report.

If the report indicates that certain repairs could not be made, you must start up the client workstation(s) from a known-good disk (for example, a system software CD) and attempt to repair the affected hard disk.

Step 4: Quit All Applications

Quit all applications on the client workstation(s) before attempting the copy operation. This can be done remotely with Network Assistant by selecting the client workstation(s), then choosing Quit Applications from the Manage menu.

Step 5: Delete Network Assistant Preferences

On each affected admin and client workstation, drag the Network Assistant Preferences file, located in the Preferences folder, to the Trash.

Important: When you delete the preferences file from a workstation, its passwords must be reset. On client workstations, use the Network Assistant Security application to change the password and re-enable administrator control. The Network Assistant admin application allows you to change its password and recreate your Network Assistant Workstation Lists.

Step 6: Perform System Extensions Troubleshooting

Perform system extensions troubleshooting on the affected admin and client workstations. For more information on this topic, refer to technical document 30929: "**Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features**"

Step 7: Install Network Assistant Admin on Another Workstation

Install the Network Assistant admin application on another workstation and use it as the copy source.

Step 8: Isolate Potential Network Issues

Try using a different network protocol. For example, if you are using TCP/IP, try using AppleTalk. For more information on forcing Network Assistant to use a different network protocol, refer to technical document 60873: "**Network Assistant: Troubleshooting by Forcing a Connection Using AppleTalk or TCP/IP**"

If using a different protocol does not reveal the source of the issue, try reducing the number of clients to whom you are simultaneously copying. If limiting the number of clients does not resolve the issue, try to isolate the issue by limiting the tested clients and admin workstation to a particular subnet or physical network segment and then utilizing a decreasing number or clients. If the issue persists, set up an isolated network and continue testing.

If your Network Assistant clients are connected through AirPort, refer to technical document 88165: "**Network Assistant 4: Using Apple Network Assistant on an AirPort Network**". It offers recommendations on where to connect your Network Assistant admin workstation and suggestions on AirPort Base Station configuration.

If any of these actions in Step 8 resolve the issue, try to determine if network topology and other associated network setup issues are the source of this issue.

Additional recommendations

If issues persist, try the following:

1. If clients are Macintosh Manager/Multiple Users clients, log in with System Access prior to attempting the copy.

2. If you are trying to copy an entire hard disk to several Network Assistant workstations, copy only the System Folder first, then copy all other items.

3. Erase the Network Assistant client's hard disk before attempting the Network Assistant copy.

4. Try using a volume other than the admin workstation's startup volume as the copy source. If another local volume is not available, use Disk Copy to create a disk image of the startup volume and use it as the copy source. **Note:** You must start up from a CD to make an image of the startup volume.

5. If the Network Assistant client computers are connected through AirPort, experiment with the multicast and density settings for the best performance. Generally, better performance can be achieved with a "High" density setting and a multicast rate of 11 Mb. **Note:** The Network Assistant admin workstation should be connected to the wired Ethernet network.

6. Schedule the copying of hard disks over a longer period of time rather than copying all disks at once. This reduces network traffic, which can increase significantly with simultaneous disk copies.

Example of scheduling

The following is an example of how to schedule a copy using Network Assistant 4. Scheduling works with Mac OS 9 clients with Network Assistant 4.0 or later installed. For Mac OS 8 clients, update to Network Assistant 4.0.4 or later to use scheduling.

Schedule a few clients at a time (five to ten). If issues arise, then reduce the number of clients and create another scheduled time for other clients.

In this example, we delete all other items on the client's startup disk and then copy the following items:

- Applications (Mac OS 9)
- Documents
- Late Breaking News
- System Folder

Follow these steps:

1. Create a new user on an AppleShare (AFP) server ("ANA User" in this example).

2. Create a new share point on the same AFP server ("ANA Update" in this example), giving the ANA User read-write access.

3. Open Network Assistant admin on the computer that is to be copied (or cloned).

4. Connect to the ANA Update share point, authenticating as the ANA User.

5. In the Network Assistant admin, select the workstation(s) you would like to schedule.

6. Choose Schedule from the Server menu.

7. In the Schedule window, be sure that ANA Update is the selected server.

8. Enter the name and password information for the ANA User.

9. Set the desired scheduled time, and select the "Copy items from server" option. You may enable other options, but they are not required.

10. Click the Select button that becomes available after enabling the "Copy items from server."

11. In the Select Items dialog, navigate to the following items in the Available items list:
    - Applications (Mac OS 9)
    - Documents
    - Late Breaking News
    - System Folder
12. Add each of these items to the "Items to copy" list.

13. Navigate the "Items to copy" list to the NA Copy Items folder, and select the "Delete other items on disk" option. Because this action only applies to that folder, you must repeat this step for the "Applications (Mac OS 9)", the Documents folder, and the System Folder.

14. Click Done in the Select Items window. A dialog appears, asking if you are sure you want to permanently delete all items on the selected workstations except for the System Folder. Select Yes if you are sure.

15. You are now back at the Schedule window. Double-check the values here. When you are sure they are correct, click Change.

Once the client's time reaches the designated time, the copy process begins. If you select Now for the scheduled time, then the process begins when you click Change in step 15.

Notes

1. Deleting items takes place prior to copying and may take some time to complete. If this occurs when the AFP server is configured to disconnect idle users, clients may be disconnected while they are still deleting items. In this event, the process will not complete until you change the idle disconnect feature to a longer value or disable it.

2. To ensure clients have the same contents in these nested folders, be sure to navigate to these folders in the "Items to copy" list and select the "Delete other items on disk" option for each nested folder (Step 13). This setting is specific to each folder and does not apply to all folders unless explicitly set to do so.

3. If a client misses a scheduled event, the client will perform the steps as soon as it is available to do so.

Mac OS 9: Files Saved in Mac OS X Aren‘t on Desktop

Files saved or placed on the desktop in Mac OS X do not appear there when you start up with Mac OS 9. This article tells where files saved or placed on the desktop in Mac OS X are stored.
This article has been archived and is no longer updated by Apple.

Symptom

Files saved or placed on the desktop in Mac OS X do not appear there when you start up the computer with Mac OS 9.

Solution

Files you save or place on the desktop in Mac OS X are stored in your Mac OS X Desktop folder. You can access files in your Desktop folder by navigating to it in Mac OS 9. Each user you define in Mac OS X has a separate Desktop folder, and the contents are never shared between users. The path to a user's Desktop folder begins with the Mac OS X startup disk, as listed below and illustrated in Figure 1:

<Mac OS X startup volume>
  Users
    <user name>
      Desktop

Figure 1 Location of Mac OS X Desktop folder for the user named witherow

iMac: When Degauss Circuitry Is Activated

This article explains when an iMac computer's degauss circuitry is activated.

This article has been archived and is no longer updated by Apple.

The degauss circuitry in an iMac computer activates at these times:

- When the computer starts up.
- When the computer restarts.

The degauss circuitry does not activate when the computer wakes from sleep.

Degaussing works best when the computer has been turned off for a period of time, and its components have been allowed to cool. To remove any residual magnetic fields that may build up over time, you should occasionally shut down the computer, let it sit for a time, and then start it up.

For more information, see document 30485: "**Monitors: Influence of External Magnetic Fields**".

Mac OS 9: How to Turn Off Individual "Recently Used Items" Submenus

With Mac OS 9, you can turn off a specific "recently used items" submenu in the Apple menu while leaving others on by using the Apple Menu Options control panel to set the submenu value to zero.

This article has been archived and is no longer updated by Apple.
With Mac OS 8 and Mac OS 9, you can turn off a specific "recently used items" submenu in the Apple menu while leaving others on by using the Apple Menu Options control panel to set the submenu value to zero.

For example, to turn off Recently Used Documents but leave Recently Used Applications and Recently Used Servers turned on, set the Recently Used Documents value to zero in the Apple Menu Options control panel. See Figure 1.

Figure 1 Turning Off Recently Used Documents

To turn off all recently used items, deselect the "Remember recently used items" option by clicking the checkbox.

When a submenu is turned off and you close the Apple Menu Options window, the corresponding Recently Used Items folder and its contents are moved to the Trash.

Note: The folder contains only aliases to the recently used items; the actual items are not moved to the Trash.

For related information on this topic, refer to the following documents:

Document 30004: "**Apple Menu Options: Not Creating Recent Document Aliases**"
Document 60762: "**Mac OS 9: Missing Apple Menu Items Could Be Due to Damaged Preferences**"

Mac OS X: Using the Finder to Mount NFS Exports

This article explains how to mount NFS exports with the Mac OS X Finder.

This article has been archived and is no longer updated by Apple.
Follow these steps to use the Mac OS X Finder to access files that have been shared by an NFS-based computer (also referred to as "mounting an NFS export"):

Step 1

With the Finder active, choose Connect to Server from the Go menu; the Connect to Server window appears.

Step 2

In the Address text box, enter `nfs://` followed by the hostname or IP address of the server and the full path to the export. See the example in Figure 1.

Figure 1 Connect to Server window

Step 3

Click Connect; the Connect to Server window closes. With Mac OS X 10.1 or later the NFS exports will mount on the desktop (unless you've turned that feature off on the server, then the export will only appear in the Finder window). If your computer has Mac OS X 10.0 through 10.0.4, continue with steps 4 and 5.

Step 4

Choose Go to Folder from the Go menu; the Go to Folder dialog box appears.

Step 5

In the text box, enter `/Volumes/` followed by the hostname or IP address of the server and click Go. See the example in Figure 2.

Figure 2 Go to Folder dialog box

If you need to use more sophisticated options when mounting an NFS server, use the Terminal application to issue commands. See the man pages for mount and mount_nfs.

iTunes: Difference Between Date and Date Added Columns

This article explains the difference between the Date column and the Date Added column in iTunes.

This article has been archived and is no longer updated by Apple.
The iTunes View Options include two items named Date and Date Added. See Figure 1.

Figure 1 View Options

Date

This field shows the date the MP3 file was last modified. The date corresponds with when the song was converted to MP3, or when a change in the ID3 Tag was made.

Date Added

This field shows the date the MP3 file was added to the iTunes Library or Playlist.

Power Mac G4 (QuickSilver): Mold Lines Are Normal

Mold lines form during manufacturing when the Power Mac G4 (QuickSilver) computer's plastic enclosure is molded. These lines are a normal and accepted part of manufacturing, not a defect or weak point.

This article has been archived and is no longer updated by Apple.
Small lines in the enclosure of the Power Mac G4 (QuickSilver) computer are called mold lines. They occur when the computer is manufactured, and may appear on the enclosure's inside and outside surfaces. Mold lines are not cracks, and do not represent a weakness or defect in the plastic.

On the Power Mac G4 (QuickSilver) computer, mold lines may be visible at these locations:

- below the optical media bay
- below the Zip drive bay
- to the side of the front panel buttons

Mac OS X Server 10.0: Incorrect Hostname May Cause Trouble Connecting With Server Admin or Other Services

The hostname entered in the Mac OS X Server Setup Assistant must match the DNS entry for your server.
This article has been archived and is no longer updated by Apple.

Symptom

- You experience difficulty connecting to the server with the Server Admin application.
- Clients experience difficulty connecting to other services.

Solution

The hostname may be incorrect. This can happen if:

- An incorrect hostname was entered in the Setup Assistant.
- The current DNS entry and hostname for your server no longer correspond to the hostname originally entered in Setup Assistant.

What is the hostname?

The hostname is the DNS subdomain name of your server.

Example URL:

> http://myserver.apple.com

This example URL shows a fully qualified domain name. The hostname would be only the subdomain, which would be:

> myserver

Steps to correct

Follow these steps to correct the hostname:

1. Choose Log Out from the Apple Menu.
2. Log in as root.
Note: If you need information on the root user or experience any issue logging in as root, see the related technical documents listed below.
3. Open TextEdit.
4. Choose Open from the File menu.
5. In the Go To field type: `/etc/`
6. Press Return.
7. From the list that appears, select the file named `hostconfig` and click Open.
Important: Several other files have similar names. Be sure to choose only the exact match.
8. Find the line: `HOSTNAME=mywrongname`
9. Correct this line to read: `HOSTNAME=mycorrectname`
Note: mywrongname and mycorrectname are examples. Type your actual hostname where mycorrectname appears in this example. Be sure not to make any other changes to the file.
10. Choose Save from the File menu.
11. Restart the computer.

Mac OS X 10.2: Repair Disk Permissions Finds Issue With /private/var/db/netinfo/local.nidb/

Disk Utility Repair Disk Permissions may erroneously report an issue with /private/var/db/netinfo/local.nidb/ while started up from a Mac OS X Install CD. The issue does not occur when started up from the Mac OS X volume.
This article has been archived and is no longer updated by Apple.

Symptom

Disk Utility Repair Disk Permissions, when started up from your Mac OS X Install CD, may erroneously report an issue with /private/var/db/netinfo/local.nidb/* . For example:

> "Permissions differ on ./private/var/db/netinfo/local.nidb/[text]"

Note: The text that appears after "local/nidb" varies, but may include "/Store.288" or "/Clean".

Solution

The message is not accurate but is not a cause for concern.
Published Date: Oct 10, 2016

Mac OS X: Classic Application Does Not Recognize CD-ROM Disc

This document discusses a situation in which a CD-ROM disc is not recognized by a Classic application, even though the disc may appear on the desktop.
This article has been archived and is no longer updated by Apple.

Symptom

- A Classic application reports that a CD-ROM disc is not inserted.
- Installation of a Classic application that requires more than one disc does not complete.
- A Classic application does not recognize both the audio and data partition of a disc.

Solution

Update to Mac OS X 10.2.5 or later for best results.

1. Insert the disc before starting the Classic environment.

   Note: If the Classic environment is already running, open System Preferences and use the Classic preference pane to stop the Classic environment.

2. If the issue persists, you may need to start up from your Mac OS 9 System Folder to install or use the software.

This issue can occur when:

- The disc uses an earlier kind of disc copy protection.
- The disc contains both data and audio partitions.
- The disc's title includes diacriticals, such as **ç**.

  Important: Update to Mac OS X 10.2.5 or later to address the latter issue (diacriticals).

Note: You should contact the manufacturer of the disc for Mac OS X compatibility information.
Published Date: Oct 10, 2016

Mac OS X: About the Java 1.4.1 Update

This software adds Java 1.4.1 to Mac OS X. Mac OS X 10.2.3 or later is required.

Note: Later (newer) versions of Java are available from Apple Downloads.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. To install this update, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change the administrator account password, choose Apple menu > System Preferences, then View > Accounts. Select an account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

2. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to install the Java 1.4.1 Update.

Automatic Software Update Installation

See technical document 106704, "**Mac OS X: How to Update Your Software**." Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates. Mac OS X 10.2.3 or later is required for this update.

Standalone Installer

An installer is available from Apple Featured Software (http://www.apple.com/swupdates/). Mac OS X 10.2.3 or later is required.

Enhancements

- Improves compatibility for applets on secure webpages (https://) .
- Allows you to print from webpage applets.
- Enables JDK 1.4.1 support for Safari.
- Supports dynamic applet menus.
- Improves Universal Access compliance.
- Supports full screen mode.
- Allows for certificates encountered via secure webpages or signed code to be saved in the default keychain.
- Supports glyph substitution for double-byte characters.
- Improves applet frame border shadows and minimizing.
- Supports sound input.
- Offers international keyboard support.
- Allows for more precise text rendering.
- Offers software-based graphics acceleration for Java applets designed to use this feature, on all systems.
- Reduces situations in which scrolling within an applet could be slow.
- Enhances multi-tasking robustness.

Mac OS X: How to use a PPP connection script

This document explains how to use a PPP connection terminal script if your ISP requires it. Connecting to a PPP using a terminal script is usually not necessary.
This article has been archived and is no longer updated by Apple.
Follow these steps after you receive the script file from your ISP.

How to install a Terminal script

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. Type "/Library/" and click Go.
4. From the **File** menu, choose **New Folder**. Name the new folder "Terminal Scripts".
5. Drag the terminal script file(s) to use into the Terminal Scripts folder.
6. Follow the steps for "How to choose the connection script".

How to choose the connection script

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Network**.
3. Choose Internal Modem from the "Show" pop-up menu.
4. Click the PPP tab.
5. Click PPP Options.
6. Choose your connection script from the Terminal Script pop-up menu.

   Tip: If the Terminal Script pop-up menu is dimmed, click Cancel, then follow the steps for "How to install a Terminal script" above.

7. Click OK.
8. Click Apply Now.

Mac OS X 10.2.4: Date Resets to 1969 or 1970 After Update

After updating to Mac OS X 10.2.4, the computer date resets to 1969 or 1970.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to Mac OS X 10.2.4, the computer date resets to 1969 or 1970.

Solution

Update to Mac OS X 10.2.5 or later.

Published Date: Oct 10, 2016

Mac OS X: PPP connection fails, how to turn PPP LCP echo off

This document describes how to turn off the PPP LCP (Link Control Protocol) Echo option. You may need to do this if you can't connect to the Internet via PPP (dial-up modem).
This article has been archived and is no longer updated by Apple.
The PPP connection to the Internet is not made if a PPP server does not reply to LCP Echo packets.

This document applies to Mac OS X 10.1 or later.

Mac OS X 10.1

1. Open the Internet Connect applications.
2. Click Advanced Options.
3. Deselect "Send LCP echo packet".

Mac OS X 10.2, 10.3 or later

1. Choose Apple menu > System Preferences.
2. Choose View > Network.
3. Choose Internal Modem from the Show pop-up menu.
4. Click the PPP tab.
5. Click PPP Options.
6. Deselect "Send PPP echo packets".

Mac OS X: How to change a Mail message‘s reply-to address

Learn how to change a Mail message's Reply-To address. What's that? A reply-to address is the address that your recipients' email application uses to reply to your email.
This article has been archived and is no longer updated by Apple.
Follow these steps to add a Reply-To header to your message:

1. Compose an email message.
2. From the **View** menu, choose **Reply-To Header**.
3. Type the reply-to email address in the Reply-To header. Any replies to this message will be sent to the reply-to address.

Tip: Repeat the last step for any other new email messages that you wish to do this for.
Published Date: Oct 10, 2016

Mac OS X 10.2: Check Print Queue If Documents Do Not Print

When a printer's print queue is stopped, print jobs do not print. Use Print Center to start the queue.
This article has been archived and is no longer updated by Apple.

Symptom

- When you print a document, everything seems to work, but the document never comes out of the printer.
- The printer appears in the Printer list in Print Center with a status of "stopped".
- One of these messages appears:

  "Printer's queue is stopped. Really print?" (Clicking OK does not start the print queue.)

  "Printing of jobs for this printer is stopped. Do you want to continue and restart the printing of jobs?"

Solution

Note: For best results when printing, upgrade to Mac OS X 10.2.3 or later.

Starting the print queue may allow documents to print.

Mac OS X 10.2.3 or later

1. If you see the message above, click Continue.
2. If your document does not print, follow the steps for Mac OS X 10.2.2 below.

Mac OS X 10.2 through 10.2.2

1. Open Print Center (/Applications/Utilities).
2. Choose Printers > Show Printer List.
3. Select your printer.
4. Choose Printers > Start Jobs.

Documents should now print. If not, go to step 5.

5. If the queue stops immediately after being started, check the printer and its connection to the computer. One of the following issues may keep the printer from being able to accept or complete a print job:
   - Paper feed issues
   - Ink tanks that are empty, improperly installed, or misaligned.
   - Loose connections or damaged cables.

   Consult your printer's documentation for information on isolating and correcting paper feed or ink issues.
6. Look for a status message in the Jobs window. See technical document 106714, "**Mac OS X: Troubleshooting Printing Issues**" to resolve other issues.

Mac OS X 10.2.4: Unable to Establish or Maintain Dial-Up Connection

With Mac OS X 10.2.4, a dial-up (PPP) modem connection cannot be established, or is unreliable.
This article has been archived and is no longer updated by Apple.

Symptom

- When connecting to some modem servers, Internet Connect may report there is a connection, but then have difficulty establishing a connection.
- If the connection is established, Internet services such as Web browsing or email may not work.
- The connection is unexpectedly lost within a few minutes.

Solution

Update to Mac OS X 10.2.5 or later.

Published Date: Oct 10, 2016

Mac OS X 10.2: Keyboard Layout Changes to U.S. at Startup, Issues Logging In

The keyboard layout unexpectedly changes to U.S. during startup and creates issues logging in.
This article has been archived and is no longer updated by Apple.

Symptom

If you use a custom desktop picture, the keyboard layout changes to U.S. during startup. You may not be able to log in because typed characters do not match the keys on the keyboard.

Solution

Logging in

If your user name and password contains only numerals, use your keyboard's keypad to log in as expected, then go to "After logging in" below.

If you use any other character in your user name or password, refer to this U.S. keyboard layout graphic to find the equivalent keystrokes.

Figure 1 U.S. keyboard layout

After logging in

Use these steps to resolve the issue:

1. Rename the desktop picture you want to use. Be sure to include the filename extension. For example, the filename should end with ".jpg" if your picture is a JPEG file.

2. Select the image file again. For specific instructions, see technical document 106758, "**Mac OS X: How to Change Your Desktop Picture**".

Published Date: Feb 17, 2012

Mac OS X 10.2.8 or Earlier: Mail - Always Uses U.S. Date and Time Notation

Mail uses U.S. date and time notation, regardless of the Region settings in the International preference pane.
This article has been archived and is no longer updated by Apple.

Symptom

Mail always displays message dates and times using U.S. date and time notation. For example: "Wed Feb 26, 2003 5:06:16 Europe/Stockholm".

Solution

You can try this workaround to change Mail to honor the 24-hour clock format instead of the 12-hour clock format.

1. Choose Apple menu > System Preferences.
2. Choose View > International.
3. Click the Language tab (if necessary) and drag English to the top of the list.
4. Choose System Preferences > Quit.
5. Choose Apple menu > Log Out.
6. From the login panel, select or type your user name and password to log in.
7. Choose Apple menu > System Preferences.
8. Choose View > International. Click the Time tab and verify that the Time format is set to the 24-hour clock format
9. Click the Language tab and drag your preferred language to the top of the list.
10. Choose Apple menu > Log out.
11. From the login panel, select or type your user name and password to log in.
12. Mail should now honor the 24-hour clock format using your preferred language.

Note: This only changes the 12-hour clock format to the 24-hour clock format. This will not change the default US Date format used by Mail.

Published Date: Feb 19, 2012

Mac OS X 10.1.5: About the Security Update 2003-03-03

The Security Update 2003-03-03 improves security for Mac OS X 10.1.5.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. To install Security Update 2003-03-03, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change an administrator account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

2. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to install this update.

Automatic Software Update Installation

Choose Apple menu > System Preferences then choose View > Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates. Mac OS X 10.1.5 is required before installing this update.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

Enhancements

Resolves a security issue in sendmail in which a remote individual could gain access and control of the system. Although sendmail is turned off by default, all users should install this security update.

Published Date: Feb 17, 2012

Mac OS X: About the "Ignore Trackpad While Typing" Option

This document describes the "Ignore trackpad while typing" option in the Mouse preference pane.
This article has been archived and is no longer updated by Apple.
As you type on a PowerBook or iBook keyboard, your thumbs or palms may hover over the trackpad, occasionally touching it briefly. This may have the unintended effect of moving the pointer while typing, or, if trackpad clicking is on, moving the insertion point to a different part of your document.

Selecting the "Ignore trackpad while typing" option can prevent unintended trackpad movements. When selected, trackpad clicks, drags, and very small movements are ignored as you use the built-in keyboard.

Even when this option is selected, modifier keys (such as Option and Command), keystrokes on an external keyboard, and deliberate trackpad movements are not ignored. The trackpad button is also unaffected.
Published Date: Feb 17, 2012

Mac OS X: About the Mac OS X 10.2.5 Update

This software updates Mac OS X 10.2.4 to version 10.2.5.
This article has been archived and is no longer updated by Apple.
This information is available in:

Français | Deutsch | Español | Italiano | Nederlands | Svensk |

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system
through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X 10.2.5, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key

If you need to change an administrator account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

4. If you are installing on a PowerBook G4 (17-inch), iMac (17-inch 1GHz), or a Power Mac G4 computer with an NVidia GeForce 4MX or NVidia GeForce 4 Titanium display card connected to an LCD display, first review technical document 25434: "**Mac OS X 10.2.5 Update: Set Display to Native Resolution Before Installing**".

Installation

There are two ways to update to Mac OS X 10.2.5: Software Update or standalone installer.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates (such as this one).

Standalone Installers

An installer is also available from Apple Downloads. For example, you can go there and search on "10.2.5" to find the standalone installer.

There are two versions of the standalone update installer available:

Mac OS X 10.2.5 Update updates Mac OS X 10.2.4 to the new version. This document describes how to use this installer.

Mac OS X 10.2.5 Update (Combo) updates Mac OS X 10.2 through 10.2.4 to version 10.2.5. If you need to use the Combo installer, see technical document 25406, "**Mac OS X: About the Mac OS X 10.2.5 Update (Combo)**".

Enhancements

Enhancements delivered with this update include:

Digital hub and disc burning

Bluetooth Setup Assistant now works with certain Microsoft keyboards and mouse devices.

Includes Bluetooth support for Nokia 7650 and Sony Ericsson P800 phones, allowing for pairing and implementing an Internet connection through

the phone.

Improves compatibility for discs burned with certain Panasonic consumer burners.

Adds Image Capture support for Canon EOS 10D, ZR65, and ZR 70 cameras.

Adds disc burning support for several device-LaCie d2 DVD Multi U&I Drive and d2 CD-RW 52x24x52x, Visual Frontier COHH-B1-A48 and COSP-B1-C24, MacPower Cold Chisel 24x12x24x8x, and these BUSlink devices: FW5252FM FireWire 52x24x52x CD-RW drive, FW4848FM FireWire 48x12x48x CD-RW Drive, RW4040FM FireWire 40x12x40 CD-RW Drive.

Networking and Internet

Addresses an issue in which domain name lookups could fail if the DNS server responded with a very large reply packet.

Improves the way that LDAPv3 connections time out when idle.

Addresses a potential data loss issue that could occur when copying certain files to an SMB volume.

Addresses issues with Internet Sharing when certain types of DSL or cable modem connections are shared.

Improves security by resolving an issue in which a guest could gain read access to the contents of a shared Drop Box folder remotely.

The Internet preference pane can now store .Mac passwords that are up to 32 characters long.

Addresses an issue in which some Apple internal modems could not establish or maintain a connection to certain Scandinavian Internet service providers.

For client AFP connections, it is no longer necessary to configure Windows 2000 Share Points to be owned by an administrator group.

Other

Improves Mail's selection of character encoding for messages sent in these languages: Arabic, Bulgarian, Greek, Hebrew, Hungarian, Icelandic, Polish, Romanian, Russian, Thai, Turkish, Ukrainian.

Improves Mail responsiveness for accounts configured with multiple POP servers, when the servers are unavailable.

Addresses an issue in which an application could unexpectedly quit when printing, if /tmp was missing or unavailable.

Addresses an issue in which a damaged GIF file, such as a website graphic, could cause an application to unexpectedly quit.

Addresses an issue in which certain PICT graphics could not be displayed.

Addresses an issue in which the date may unexpectedly be set to 1969 or 1970 during startup.

Addresses an issue when using the Hanin input method for Traditional Chinese in which Carbon applications could unexpectedly quit if a modifier key (such as Control) was pressed when no text insertion point was available.

Addresses an issue in which Classic does not start ("Error 1016") when applications are restricted to accounts that are not administrator accounts.

Addresses an issue in which the Classic environment could become unresponsive after placing a Classic application's save confirmation dialog box in the background.

Addresses an issue in which using the Command-Option-Shift-Q keyboard shortcut would immediately quit the Classic environment.

Improves the reliability of AppleEvents traffic (inter-application communication) between software open in the Classic environment and native Mac OS X; addresses an issue in which a user might not be able to log out after using a Mac OS 9 version of America Online (AOL).

Address Book now supports the Siemens S55 phone.

Mac OS X: About the Mac OS X 10.2.5 Update (Combo)

This software updates Mac OS X 10.2 or later to version 10.2.5.
This article has been archived and is no longer updated by Apple.

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system
through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X 10.2.5, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key

If you need to change an administrator account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

4. If you are installing on a PowerBook G4 (17-inch), iMac (17-inch 1GHz), or a Power Mac G4 computer with an NVidia GeForce 4MX or NVidia GeForce 4 Titanium display card connected to an LCD display, first review technical document 25434: "**Mac OS X 10.2.5 Update: Set Display to Native Resolution Before Installing**".

Installation

There are two ways to update to Mac OS X 10.2.5.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installers

The Mac OS X 10.2.5 Update (Combo) standalone installer updates Mac OS X 10.2 through 10.2.4 to version 10.2.5. This installer is available from Apple Featured Software (http://www.apple.com/swupdates/).

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it also includes those delivered with Mac OS X 10.2.1, 10.2.2, 10.2.3, and 10.2.4. Enhancements are listed individually in these technical documents:

25405: "**Mac OS X: About the Mac OS X 10.2.5 Update**"
107362: "**Mac OS X: About the Mac OS X 10.2.4 Update**"
107263: "**Mac OS X: About the Mac OS X 10.2.3 Update**"
107140: "**Mac OS X: About the Mac OS X 10.2.2 Update**"
107036: "**Mac OS X: About the Mac OS X 10.2.1 Update**"

Mac OS X: About Third-Party Printer Compatibility

This document provides links to Mac OS X compatibility information about Brother, Canon, Epson, Hewlett-Packard (HP), and Lexmark printers.
This article has been archived and is no longer updated by Apple.

About third-party printers

Click the links below for information about specific brands of printers.

Brother (http://www.brother.com/E-ftp/macosxstate.htm)

Canon (http://www.usa.canon.com/html/conCprSupport.jsp?type=osx)

Epson (http://support.epson.com/webadvice/wa0301.html)

HP (http://welcome.hp.com/country/us/en/support.html)

Lexmark (http://www.lexmark.com/)

Xerox (http://www.office.xerox.com/perl-bin/opb_drivers.pl)

About third-party printer drivers

Some printer modules (drivers) are already included with Mac OS X. Some printers only work with certain versions of Mac OS X. Some drivers for Mac OS X may not include the same features as drivers for Mac OS 9.

Mac OS X 10.2: Java 1.4.1 Frequently Asked Questions (FAQ)

This document contains frequently asked questions (FAQ) about Java 1.4.1, with answers to those questions.
This article has been archived and is no longer updated by Apple.

Questions answered in this document:

1. Does Java 1.4.1 replace Java 1.3.1?
2. Which version of Java does Safari (Beta) use?
3. Does my third-party Web browser support Java 1.4.1?
4. Do existing Java applications start using Java 1.4.1 automatically?
5. Which version of Java do JAR files use?

Question 1: Does Java 1.4.1 replace Java 1.3.1?

Answer: The Java 1.4.1 Update adds Java 1.4.1 to Mac OS X. It does not replace Java 1.3.1. Both versions exist simultaneously to preserve backward compatibility for applications and services that rely on prior versions.

Question 2: **Which version of Java does Safari (Beta) use?**

Answer: The beta version of Safari uses Java 1.4.1, if it is installed.

Question 3: **Does my third-party Web browser support Java 1.4.1?**

Answer: If you use a Web browser released prior to Java 1.4.1 (which was released 2003-03-10), it may not use Java 1.4.1. For compatibility information, contact the software publisher.

Question 4: **Do existing Java applications start using Java 1.4.1 automatically?**

Answer: Existing applications that do not specify a runtime-choosing logic, or that specify Java 1.3.1, continue to use Java 1.3.1. Check with the application's publisher for more information.

Question 5: **Which version of Java do JAR files use?**

Answer: JAR files opened from the Finder use Java 1.4.1.

Note: If your JAR file must use Java 1.3.1, use the following advanced steps to open it:

1. Open Terminal (/Applications/Utilities).
2. Type:

```
/System/Library/Frameworks/JavaVM.framework/Versions/1.3.1/Home/bin/java -jar
```

Important: Leave a space following "-jar" but do not press Return yet.

4. Locate the JAR file in the Finder.
5. Drag the JAR file's icon to the Terminal window to automatically enter the file's path.
6. In Terminal, press Return.

Mac OS X 10.2, 10.3 (Spanish): Modem Unable to Connect, Default Modem Is Not Apple Internal Modem

If Spanish is the selected as the preferred language in Mac OS X 10.2 to 10.3.9, the internal modem script for certain computers may be incorrectly set to "3Com Impact Analog 14.4".
This article has been archived and is no longer updated by Apple.

Symptom

- The Apple internal modem disconnects during negotiation or shortly after the connection is made.
- The Apple internal modem only connects at 38.4 kbit/s.

Solution

1. Choose Apple menu > System Preferences.
2. Choose View > Network.
3. Choose Internal Modem from the Show pop-up menu.

   Note: If the Internal Modem item does not appear in the Show pop-up menu, choose Active Network Ports instead, then select the Internal Modem option.

4. Click the Modem tab.
5. Change the default modem script to Apple Internal 56K Modem (v.90).
6. Click Apply Now.

This document will be updated as more information becomes available.

iMac, iBook: How to Reinstall World Book Software

Learn how to reinstall World Book software, included with certain iMac, eMac, and iBook computers. You cannot install it from the World Book Media CD.

This article has been archived and is no longer updated by Apple.

World Book Encyclopedia software cannot be reinstalled from the World Book Media CD. When you open this disc, a window appears with a folder named "INFO_DAT". The World Book 2003 Edition Media CD window also displays these folder aliases: "Launch World Book" and "Open World Book Folder". Clicking either of these results in an alert with this message:

> "Cannot Find World Book. The World Book may have been deleted, may not have been installed, or may have been moved to a location that you cannot access."

This happens when using:

- World Book Encyclopedia Mac OS X Edition
- World Book 2003
- eMac
- iBook computers that come with Mac OS X 10.1 or later:
  - iBook (Opaque 16 VRAM)
  - iBook (32 VRAM), iBook (14.1 LCD 32 VRAM)
  - iBook (14.1 LCD 16 VRAM)
  - iBook (14.1 LCD)
  - iBook (Late 2001)
  - iBook (Dual USB)
- iMac computers that come with Mac OS X 10.1 or later:
  - iMac (Flat Panel)
  - iMac (17-inch Flat Panel)
  - iMac (17-inch 1GHz)
  - iMac (Summer 2001)

The World Book Media CD is used for animations and videos displayed by the World Book application. It is not used to install World Book software. Use the Software Restore discs or DVD that came with your computer to install this software.

Note: Not all iMac (Summer 2001) computers included Mac OS X 10.1 and World Book software.

Mac OS X: DVD Player Distortion or Discoloring at Edge of Frame

With some DVD-Video discs you may notice a narrow distortion or discoloring at the left or right edge of the picture.
This article has been archived and is no longer updated by Apple.

Symptom

A narrow distortion or discoloration ("encoding artifact") appears at the left or right edge of the picture. For example, you may see a faint green line on the right side, or a thin, blurred line during motion.

Products Affected

- DVD Player for Mac OS X

Solution

This is expected behavior because Apple DVD Player displays the entire video frame. The same issue can occur with a set-top DVD player that is connected to a television set that shows the entire picture. Many television sets "overscan" the video so that the outermost edges of the picture are not visible.
Published Date: Feb 17, 2012

Mac OS X: "Wake for Network Administrator Access" Option Is For Ethernet Only

The option "Wake for network administrator access" (also known as "wake on LAN" or "using a magic packet") in the Energy Saver preference pane only works for Ethernet ports.

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.0 through 10.2.8, the option "Wake for network administrator access" (also known as "wake on LAN" or "using a magic packet") in the Energy Saver preference pane only works for Ethernet ports. This is expected behavior. This option does not allow the computer to "wake" for network traffic directed to an AirPort Card or to a modem. The "Wake on ring" option provides a similar feature for modem activity.

Note: You can select this setting even if all Ethernet port configurations are deselected in the Network preference pane.

Published Date: Feb 17, 2012

Mac OS X 10.2: "HeaderOfDallasPartialInsert" Message

This document describes the causes of a potential "HeaderOfDallasPartialInsert" alert message (that is, "Header Of Dallas Partial Insert" without spacing).
This article has been archived and is no longer updated by Apple.

Symptom

As the computer starts up, or after connecting Apple Pro Speakers, this message appears:

> "HeaderOfDallasPartialInsert
> StringOfDallasPartialInsert
> ButtonOfDallasPartialInsert"

The Console utility may show messages such as:

> "locals-Computer mach_kernel: The device plugged into the Apple speaker mini-jack cannot be recognized."
> "locals-Computer mach_kernel: Remove the plug from the jack. Then plug it back in and make sure it is fully inserted."

Solution

The alert appears if the speakers' connector is not completely inserted into the port.

1. Disconnect and reconnect the speakers. Make sure to push the connector completely into the speaker port.
2. Click "ButtonOfDallasPartialInsert".

This document will be updated as more information becomes available.

Macintosh: Using your mobile phone as a wireless modem

Did you know you can use a mobile telephone as a wireless modem? If your phone and computer can connect over IrDA or Bluetooth, you're well on your way.

This article has been archived and is no longer updated by Apple.

You can connect your Macintosh to the Internet using a GPRS (General Packet Radio Service) mobile telephone as a modem. To do so, you should first make sure that you can:

- Connect to the Internet over GPRS using the WAP browser in your telephone
- Connect your Macintosh to your mobile phone over IrDA or Bluetooth.

Once you can do these two things, you can set up your computer to use the telephone as a wireless modem to connect to the Internet.

Important: GPRS data services and Internet access are typically optional offerings. Ask your mobile phone operator about GPRS availability in your area, and what the subscription fees and service charges are.

For more information, see How to Connect to the Internet Using a GPRS Mobile Telephone.

Using your mobile phone as a wireless modem

Once you have made the appropriate network settings on your Mac, you can use your mobile phone as a wireless modem.

1. Ask your mobile phone operator for the network settings necessary to use your GPRS mobile phone as a modem. In some cases, you'll use the same network settings that your phone uses. In others, you may need to get network settings specific for computers. Typically, these settings include:
    - GPRS dial-up number
    - User ID
    - Password
    - IP Address
    - DNS Address
    - other advanced settings such as authentication, data compression, header compression, and quality of service
2. From the **Apple** menu, choose **System Preferences**.
3. From the **View** menu, choose **Network**.
4. Choose New Location from the Location pop-up menu.
5. Type a name for the new location such as "Wireless Modem".
6. Choose "Network Port Configurations" from the Show pop-up menu.
7. Make sure the "USB Bluetooth Modem Adapter" is enabled. Deselect the ports or interfaces you aren't using in this location, such as "Built-in Ethernet", and "Internal Modem".
8. Click Apply Now.
9. Choose "USB Bluetooth Modem Adapter" from the Show pop-up menu.
10. Click the TCP/IP tab, if necessary. Choose "Using PPP" from the configure pop-up menu, and enter the DNS numbers and search domains as provided by your mobile phone operator.
11. Click the PPP tab, and enter the account name, password, and telephone number as provided by your mobile phone operator.
12. Click PPP Options. A sheet appears. Click "Use TCP header compression" to disable this option, and click OK. Your operator may be able to tell you if you can leave this option turned on or not.
13. Click the Bluetooth Modem tab, and choose a mobile phone model that closely resembles yours from the Modem pop-up menu. In some cases, your mobile phone operator may provide a specific modem script for you to use.
14. Click Apply Now.
15. From the **View** menu, choose **Bluetooth**.
16. Click the Settings tab, and select "Show Bluetooth status in the menu bar" to enable that option, if necessary.
17. Make your mobile phone "discoverable" to other Bluetooth devices, or turn on Bluetooth communication. See the documentation that came with your phone for instructions.
18. Choose "Search for phones" from the Bluetooth menu bar item, and select your phone, which you have already paired.
19. Once your phone and Mac are connected, open the Internet Connect application.
20. Click connect. Your telephone should connect to your mobile phone operator, and in 10 to 20 seconds, you should be able to use the Internet.

Apple Remote Desktop 1.2: How to Migrate Client Computers From Network Assistant

This document describes how to migrate Network Assistant clients to Apple Remote Desktop. Apple Remote Desktop works with systems as early as Mac OS 8.1.
This article has been archived and is no longer updated by Apple.
Apple Remote Desktop provides capabilities similar to Network Assistant. From a Mac OS X system, you can manage client computers that have these operating systems:

- Mac OS 8.1 to 9.2.2
- Mac OS X 10.1 or later

In a migration scenario, it is assumed that you have:

- A computer with Network Assistant administration software installed.
- A computer with Apple Remote Desktop administration software installed.
- At least one computer with Network Assistant client software installed that is being managed by Network Assistant.

Follow these steps to migrate your Network Assistant Clients to Apple Remote Desktop:

1. On the computer with Network Assistant administration software, insert the Apple Remote Desktop CD and navigate to the following location:

   <Language>/Mac OS 8.1-9.2/Remote Desktop Parts

   Language can be English, German, French or Japanese. You'll see two files: Remote Desktop Security and Remote Desktop Startup.

2. Open Network Assistant.
3. Select the computers that you want to update from Network Assistant to Apple Remote Desktop.
4. Drag the Remote Desktop Security file onto the list of computers. You will be prompted to specify a location to copy the file to. Select either one of the predefined locations or a different location, then copy the file.
5. Drag the Remote Desktop Startup file onto the list of computers. You will be prompted to specify a location to copy the file to. Select the Extensions folder and then copy the file.
6. Next, with all the same computers still selected, choose Manage > Restart, followed by the restart immediately option. Your client computers will immediately restart, and the clients will automatically restart a second time.
7. Once they have restarted, go to the computer that has Apple Remote Desktop administration software. Choose Setup > Computers, and start adding the former Network Assistant computers. The password will be the same as they were for Network Assistant. Likewise, the computers will have the same preferences set in Apple Remote Desktop that they had in Network Assistant.

Published Date: Oct 10, 2016

Mac OS X 10.2, 10.3, 10.4: How to protect system files used by the Classic environment

This document explains how to prevent system files and local applications used by the Classic environment from being disabled, moved, renamed, or deleted by users that do not have administrative privileges. You do this by restricting file system permissions on the Classic System Folder and the Applications (Mac OS 9) folder. This is an advanced document.
This article has been archived and is no longer updated by Apple.
In Mac OS X 10.2.4 or later, advanced users can set permissions for files used by the Classic environment. By setting these permissions, you can "protect" system files and local applications used by the Classic environment from being disabled, moved, renamed, or deleted by users that do not have administrative privileges. Users who have an administrator account (members of the admin group) will still have access to these files.

Even after taking these precautions, Classic applications will be able to write into the System Folder used by Classic, but not the "Applications (Mac OS 9)" folder. A scenario in which this could lead to an issue would be a malicious user intentionally saving a document in the System Folder, overwriting an existing system file with the same name.

Determine whether protection already exists (optional)

To verify whether permissions are set correctly, follow these steps. This is an optional section.

1. Select the Mac OS 9 System Folder used by Classic.
2. Choose File > Get Info.
3. Expand "Ownership & Permissions".

Permissions are set correctly, and you do not need to use this document if the permissions on the System Folder are:

Owner: system
Access: Read & Write
Group: admin
Access: Read & Write
Others: Read only

Tip: If you use Terminal instead, correct permissions on System Folder would appear as "drwxrwxr-x root admin".

If permissions appear differently, follow the steps below.

Set permissions for Classic environment files

Mac OS X 10.2 through 10.2.8

1. Make sure the Mac OS 9 System Folder and "Applications (Mac OS 9)" folder used by Classic are located at the root directory ("/") of the Mac OS X volume. Also, make sure these folders use their default names: "System Folder" and "Applications (Mac OS 9)"
2. Update to Mac OS X 10.2.4 or later.
3. Log in with an administrator account. Open Terminal (/Applications/Utilities).
4. Execute the following commands in Terminal:

```
sudo chown -R root:admin '/System Folder' '/Applications (Mac OS 9)'
sudo chmod -R ug+rw,o-w,a-x,a+X '/System Folder' '/Applications (Mac OS 9)'
```

You may now stop here. If you wish to further enhance security, you can configure Classic to use preferences from each user's home folder by following the optional steps below in "Configure Classic to use preferences from your home folder (optional)".

Mac OS X 10.3 or later

Open Disk Utility (/Applications/Utilities) and from the **File** menu choose **Fix OS 9 Permissions** feature.

This will set the proper permissions on System Folder that's currently selected in Classic preferences.

You may now stop here. If you wish to further enhance security, you can configure Classic to use preferences from each user's home folder by following the optional steps below.

Configure Classic to use preferences from your home folder (optional)

Mac OS X 10.3 Panther

See "Setting up Classic for multiple users".

Mac OS X 10.2 through 10.2.8

Follow these steps to allow Classic to use preferences from your home directory in order to protect these files.

If you do not use Managed Client for Mac OS X

1. Choose Apple Menu > System Preferences.
2. Choose View > Classic.
3. Click the Advanced tab.
4. Configure Classic to use preferences from the user's home folder. For instructions and more information, see "Mac OS X 10.2: About the Classic 'Use Preferences From Home Folder' Feature"
5. Quit System Preferences.
6. For enhanced security, these steps may be repeated for each user account.

If you use Managed Client for Mac OS X

1. Open Workgroup Manager.
2. Choose Workgroup Manager > Preferences.
3. Click Users, Groups, or Computers, then Classic, then Advanced.
4. Choose Always from the "Manage these settings" pop-up menu.
5. Select the "Use preferences from home folder" option.

This forces preference redirection for all users who do not have an administrator account. For each administrator account, follow the steps above for "If you do not use Managed Client for Mac OS X".
Published Date: Feb 17, 2012

Mac OS 9.2: PowerBook G3 (Bronze Keyboard) Not Available to Host in SCSI Disk Mode

PowerBook G3 (Bronze Keyboard) computers with Mac OS 9.2, 9.2.1, or 9.2.2 may unexpectedly use SCSI ID 0 when starting in SCSI Disk Mode. The PowerBook hard disk will not appear or be available to the host computer because the internal SCSI hard drive also uses SCSI ID 0.

This article has been archived and is no longer updated by Apple.

Symptom

The PowerBook unexpectedly uses SCSI ID 0 when starting up in SCSI Disk Mode and does not appear on, or become available to, the host computer.

Products Affected

- PowerBook G3 (Bronze Keyboard)
- Mac OS 9.2 through 9.2.2

Solution

Prior to starting up in SCSI Disk Mode, use the PowerBook SCSI Setup control panel and set the SCSI ID to 6. This will result in the PowerBook using SCSI ID 5 instead of 0. The hard disk will be available to the host computer as long as SCSI ID 5 is not in use by another device in the SCSI chain.

Important: Only SCSI ID 6 may be used as a workaround.

50452: "**Mac OS 9: How to Use Your PowerBook as an External Hard Disk**"

Published Date: Feb 20, 2012

Mac OS X: Opening and saving files on the Mac OS 9 desktop

Items on the Mac OS 9 desktop are kept in a folder named Desktop Folder, which is usually hidden. If you install Mac OS X and Mac OS 9 on the same disk, the Desktop (Mac OS 9) folder appears on your Mac OS X disk so you can see items on the Mac OS 9 desktop.
This article has been archived and is no longer updated by Apple.
To open the folder in the Finder, double-click the Desktop (Mac OS 9) icon.

To open the folder when you save or open a document in a Mac OS X application, open Desktop (Mac OS 9) from the Open or Save dialog.

To open the Desktop Folder when you save or open a file from a Mac OS 9 application, click the Desktop button or choose Desktop from the pop-up menu in the Open or Save dialog.

Items on your Mac OS X desktop are kept in the Desktop Folder in your home.

Your computer will only start up in Mac OS X if Mac OS 9 is not available as a startup disk. To see your available startup disks, check the Startup Disk pane of System Preferences. You can still use most Mac OS 9 applications in the Classic environment of Mac OS X by opening the Classic pane of System Preferences and clicking Start, or simply double-clicking the application icon.

Note: The information is this document comes from Mac OS X Help, the help system included with your computer. It is based on Mac OS X 10.2. If a different version is installed on your computer, choose Mac Help from the Help menu. Updated and expanded information may also be available in other Knowledge Base documents.

Published Date: Feb 17, 2012

Mac OS X 10.2: Archive and Install, "Preserve Users and Network Settings" Is Dimmed

The Archive and Install option "Preserve Users and Network Settings" can become dimmed ("grayed out") if you click the Go Back button after passing the "Select a Destination" window.
This article has been archived and is no longer updated by Apple.

Symptom

The Archive and Install option "Preserve Users and Network Settings" is dimmed.

Solution

At the "Select a Destination" window, if another volume is available, select it, then reselect the original destination volume.

If another volume is not available, restart. Do not click the Go Back button after passing the "Select a Destination" window.
Published Date: Feb 17, 2012

Mac OS: "Already Connected to" Message Appears When Connecting to Another Computer

This document explains how to resolve an issue that may occur when you connect to a Mac OS 9-based computer via file sharing. You may be unable to connect to the computer, and an inaccurate "Already Connected to" message may appear.
This article has been archived and is no longer updated by Apple.

Symptom

Connecting to one Mac OS 9 computer works as expected, but when you try to connect to another Mac OS 9-based computer via file sharing over IP, a message appears that you are already connected to the computer.

Example: Computer A (using Mac OS X) is connected to Computer B (using Mac OS 9) via file sharing over IP. Computer A then tries to connect to Computer C (using Mac OS 9) via IP, but it is unable to because an alert appears that it is already connected to Computer B.

Solution

This issue occurs when a Mac OS 9 Users & Groups Data File is copied from one computer to another, and used by both. Follow these steps on one of the Mac OS 9-based computers:

1. Turn off file sharing.
2. Delete the Users & Groups Data File (in the Preferences folder of the Mac OS 9 System Folder).
3. Use the File Sharing control panel to recreate the users and groups.
4. Turn on file sharing.

The Users & Groups Data File contains the list of user and group accounts on a Mac OS 9 computer. It also contains data that serves as a "unique identifier" for the computer when file sharing via IP is on. If this file is copied between two computers, they will appear to be the same to Mac OS 9 and Mac OS X clients.

Mac OS X 10.2: Mail - Messages in Trash Mailbox Unexpectedly Deleted After Seven Days

Some email messages in the Trash mailbox (messages originally deleted from the "On My Mac" section) are deleted after seven days, even though one or more email accounts are configured to delete messages after a longer period.
This article has been archived and is no longer updated by Apple.

Symptom

Email messages are deleted after seven days despite configuring the mailbox to delete after a longer period of time.

Mailboxes that are not in the On My Mac section, including the non-On My Mac In, Drafts, Trash, Sent and Junk mailboxes, are not affected.

Solution

Messages that are moved to a mailbox in the "On My Mac" section of the mailbox list do not respect the Special Mailboxes "Erase deleted messages" preference. If you drag a message to the Trash from a mailbox's "On My Mac" section, it will be deleted after seven days.

Use the following advanced workaround if you would like:

1. Open Terminal (/Applications/Utilities).

2. Type the following, depending on the settings you prefer:

    To never empty the Trash for deleted "On My Mac" messages, type:

    ```
    defaults write com.apple.mail NumberOfDaysToKeepTrash -1
    ```

    To erase "On My Mac" messages that are in the Trash when quitting, type:

    ```
    defaults write com.apple.mail NumberOfDaysToKeepTrash 0
    ```

    To erase "On My Mac" messages that are in the Trash and older than one week, type:

    ```
    defaults write com.apple.mail NumberOfDaysToKeepTrash 7
    ```

    Note: This is the default behavior, but it is presented here in case you wish to revert to this setting after using a different one.

    To erase "On My Mac" messages that are in the Trash and older than one month, type:

    ```
    defaults write com.apple.mail NumberOfDaysToKeepTrash 30
    ```

Mac OS X: Indian (Hindi) Fonts - How to Input Half Characters, Ligature

This document explains how to input half characters, forms, and ligature when using Indian fonts such as Devanagari.
This article has been archived and is no longer updated by Apple.
To generate half forms and ligatures, type the full form of a character followed by the Halant key. The half form will be used if there is another consonant after the Halant.

Note: The Halant key is the D key on Devanagari keyboards and the F key on Devanagari-QWERTY keyboards.

Example: To type "namaste", the key sequence on the Devanagari keyboard would be: V-C-M-D-L-S. After you type L, you will see the half form of the character SA.

Mac OS X 10.2.5 Update: Set Display to Native Resolution Before Installing

On certain computers, you should set the Displays preferences to the native resolution before installing the Mac OS X 10.2.5 Update. If you do not, temporary video issues may occur when the computer wakes from sleep.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to Mac OS X 10.2.5 and waking the computer from sleep, the image on the built-in or external display appears garbled.

Solution

To avoid this issue, set the Displays preferences to the native resolution for your display. The native display resolution the PowerBook G4 (17-inch) and iMac (17-inch 1GHz) computers is 1440x900.

The native resolution for LCD displays connected to a Power Mac G4 vary depending on the model of the display. Typically, the native resolution is the highest resolution available in the Displays preference pane.

If you did not take this precaution before installing the Mac OS X 10.2.5 Update and you see garbled video after waking the computer from sleep, follow
these steps:

1. Restart the computer.

   Important: If you cannot see on-screen video to do this, press the keyboard power key, then press the Return key. After the computer shuts down, start up again.

2. Choose Apple menu > System Preferences.
3. Choose View > Displays.
4. Select a different resolution.
5. Choose Apple menu > Restart, and click Restart.
6. After the computer restarts, you can switch back to the original resolution and the symptom will not recur.

Note: As an alternative to steps 2-5, you may reset PRAM by pressing the Command-Option-P-R keys combination as the computer starts up, until you hear a second startup chime. This restores certain system settings to their default values. For more information, see technical document 86194: "**Mac OS X: What Is Stored in PRAM?**".

Mac OS X 10.2: Modem - "Could not Open the Communications Device" Message (Bluetooth)

A "Communications Device" message may appear when you try to use a Bluetooth-compatible computer's internal modem.
This article has been archived and is no longer updated by Apple.

Symptom

The message "Could not open the communications device" when you try to connect to the Internet with the internal modem.

Solution

If you do not use a Bluetooth-compatible mobile phone for Internet access

1. Choose Apple Menu > System Preferences.
2. Choose View > Network.
3. Choose Network Port Configurations from the Show pop-up menu.
4. Deselect "USB Bluetooth Modem Adapter".
5. Click Apply Now.
6. Open Internet Connect (/Applications).
7. Choose Internal Modem from the Configure pop-up menu if it is not already chosen.

If you use both a Bluetooth-compatible mobile phone and the internal modem for Internet access

Be sure you first choose the appropriate device from the Internet Connect Configure pop-up menu.

Mac OS X 10.2.5: Some USB hubs may cause kernel panic

With Mac OS X 10.2.5, some USB hubs may cause a kernel panic a few minutes after starting up. Mac OS X 10.2.6 or later addresses the issue

This article has been archived and is no longer updated by Apple.

Solution

Download and install Mac OS X 10.2.6 or later.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.2.5 Update: Address Book Does Not Open After Updating Mac OS X 10.2.4

After updating to Mac OS X 10.2.5 from Mac OS X 10.2.4, Address Book may fail to open if the application was previously moved out of the Applications folder.

Note: This document applies to Address Book only; other Apple applications are not affected.
This article has been archived and is no longer updated by Apple.

Symptom

Address Book does not open after updating from Mac OS X 10.2.4 to 10.2.5; a message appears "The operation could not be completed. An unexpected error occurred (error code 1000)."

Address Book's icon (in /Applications) is blank (generic).

Solution

1. Delete the Address Book application (which has a blank icon) from the Applications folder.
2. Move the original Address Book application back into the Applications folder.
3. Install the Mac OS X 10.2.5 Update (MacOSXUpdate10.2.5.pkg) again.

Important: If Software Update was originally used to update to Mac OS X 10.2.5 from Mac OS X 10.2.4 but you did not save the file "MacOSXUpdate10.2.5.pkg", download the standalone installer from Apple Featured Software (http://www.info.apple.com/support/downloads.html).

Mac OS X 10.2: Applications, Utilities Sometimes Take Longer Than Expected to Open

This document discusses how to resolve an issue in which applications may sometimes take longer than expected to open (they "bounce" on the Dock for longer than expected) after changing locations or networks (including wireless networks).

Note: After the application opens once in the current location, it may open in the time expected until the location or network changes.
This article has been archived and is no longer updated by Apple.

Symptom

Applications take longer than expected to open after changing locations or networks.

The console log, under the Apple System Profiler Logs tab, may include alerts such as:

"netinfodlocal: unable to bind to parent - RPC: Timed out"

"NetInfo connection failed for server 127.0.0.1/local"

Solution

Note: You should not use this solution if you rely on NetInfo services. If you are unsure, contact your network administrator.

1. Open Directory Access (/Applications/Utilities).
2. Authenticate if necessary.
3. Deselect NetInfo.
4. Click Apply.

If the issue persists, you can try this advanced solution:

1. Open Terminal (/Applications/Utilities).
2. Type: `update_prebinding -root /`
3. After the operation finishes, quit Terminal.

For additional troubleshooting, refer to technical document 25392: "**Mac OS X Troubleshooting: How to Isolate an Issue**".

Mac OS X: Mail - Messages are unexpectedly returned, undeliverable, or remain in Out Box

Address Book entries that contain commas prevent Mail messages from being delivered to the contact's email address; the message remains in the Out box and an alert appears: "The server failed to recognize any of the recipients".

This document applies to Mac OS X 10.0 through 10.2.8.

This article has been archived and is no longer updated by Apple.
Mac OS X Mail allows you to send a message to multiple recipients by placing a comma between addresses entered in the To field. Because of this, you should avoid using commas in Address Book entries. For example, do not use "Doe, John" as the First Name of an Address Book contact (vCard). Instead, you should fill in both an entry's First and Last Name fields.

If you prefer to browse Address Book addresses in a Last Name, First Name format:

1. Open Address Book.
2. Select the card(s) that you wish to view in this manner.
3. Select Card > Swap First/Last Name.

Alternatively, you may use a character other than a comma (for example, "Doe_John") in Address Book fields.

Mac OS X: About the Mac OS X 10.2.6 Update

This software updates Mac OS X 10.2.5 to version 10.2.6.
This article has been archived and is no longer updated by Apple.
This information is available in:

Français | Deutsch | Español | Italiano | Nederlands | Svensk |

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X 10.2.6, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key.

If you need to change an administrator account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X 10.2.6.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installers

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

There are two versions of the update installer available. Mac OS X 10.2.6 Update updates Mac OS X 10.2.5 to the later version. This document describes how to use this installer.

Mac OS X 10.2.6 Update (Combo) updates Mac OS X 10.2 through 10.2.5 to version 10.2.6. If you need to use the Combo installer, see technical document 25449, "**Mac OS X: About the Mac OS X 10.2.6 Update (Combo)**".

Enhancements

The following are some of the enhancements delivered with the Mac OS X 10.2.6 Update:

- Addresses an issue for Mac OS X 10.2.5 in which a kernel panic message may appear if certain USB hubs or devices are connected.
- Improves printing compatibility for PostScript OpenType fonts.
- Improves compatibility for Maya Auto Paint and Paint Effects features.
- Addresses an issue for Mac OS X 10.2.5 in which English is the default language and Asian language scripts are not available in the International preference pane if a script's font is not available.
- Improves compatibility for MacSoft Unreal Tournament 2003 on computers with GeForce 2MX and GeForce4MX graphic accelerator chipsets.
- Address Book now supports the Sony Ericsson T610 phone.
